TO start from Chester in quest of ancient timbered houses must needs be "*ferro poma ad Aleinoun*"; and yet who so competent a judge of the genuine article as one trained and nurtured at its very head-quarters? This is just what Mr. Rimmer has attempted with the countenance of his Dean, who is too judicious a critic to allow his praise to fail of its effect by being too unqualified, and whose preface, while it notes the paucity of examples of the architecture of the past in Westmoreland or Warwick, only brings into more prominence the length and breadth of ground which has been traversed and searched. We are not indeed sure that the author might not have very considerably narrowed his range with advantage, or that some three or four counties might not have yielded as rich material for study as a dozen or a score. However, be this as it may, Mr. Rimmer assuredly possesses the requisite taste and aptitude for expounding the features of interest on which his eyes have lighted; and although we agree with Dean Howson that his plan is a trifle desultory, perhaps the best cure for that fault may be applied by any adventurous reader for himself, if he will take the trouble to map out a set portion of the author's area, and explore it in light marching order, being careful so to limit the range that what is done may be done effectually.

It may be hoped that increased attention to these old memorials will have the effect of saving many curious houses and streets from being improved away. Three such, our author assures us, would even now figure among the illustrations to this volume (one a block of four houses dating back to Richard III., and, what is more, perfectly solid and substantial), but that they have been obliged to make way for the exigencies of their space and supposed modern convenience. The more we familiarize ourselves with the architectural glories of our land, the greater will be our jealousy of suffering the spic-and-span types of building to replace the old overhanging and tier-over-tier-stretching dwelling, which in street or lane seems ready to kiss or shake hands with its neighbour across the way. We want more of the spirit of old Randal Holme of Chester, who when bidden by the Corporation in 1670 to pull down his new building (Lamb Row) in Bridge Street, as an eyesore, disobeyed the order, and, when fined for contempt, disregarded the fine likewise. The Chester Rows are in these pages likened to a passage formed by taking out the first floor all along the street and raising pillars or columns at intervals, with which to support the upper story. On the whole, perhaps, there is plausibility in the Chester historian Hemingways's theory that the excavations by which the Rows, as distinguished from the carriage road, are formed, are the work of Roman hands. The pavements in Bridge Street, Watergate, and Eastgate Street were originally level with the houses standing in the Rows. Excavation has been employed from the East, West, and South Gates to the Cross, and thence to near the Exchange, before or after the erection of the buildings. But few persons are wholly unacquainted with the Chester Rows, except perhaps that abnormal type of them which is called the "Dark Row," a sort of tunnel which at either end emerges into an open Row. Besides these, Chester still prides herself, though not without the need of some vigilance, on the retention of such old houses as Bishop Lloyd's and Stanley House in Bridge Street, the fine gabled house in Whitefriars, and several others. Nor was it only in their capital that the Cheshire folk of old distinguished themselves in building. Congleton, an ancient town to the east of Chester, on the Dane, where it flows to the Weaver, is hemmed in with gabled houses of great age; and, whether we regard solid and picturesque hosteleries of the black and white gabled pattern, with a porch that supports an upper chamber on its stone pillars (like the "Lion" at Congleton), or the splendid timber mansion (Little Moreton Hall) in the vicinity, or the curiously constructed houses of Nantwich (one has a heavy octagonal bow window overhanging a smaller one in a sort of telescope fashion), surmounted by their noble church-tower, it is clear that a taste for the picturesque was not confined to the city on the Dee.

* *Ancient Streets and Homesteads of England*. By Alfred Rimmer; and an Introduction by the Very Rev. J. S. Howson, D.D., Dean of Chester. With a Hundred and Fifty Illustrations from Drawings by the Author. London: Macmillan & Co. 1877.

Crossing the border into Shropshire, we find an air of antiquity in the church and hostelrys of Ellesmere, though, as Mr. Rimmer notes, the roomy quadrangles of the coaching-inns attest that their occupation is gone by the grass growing in them. Beside the vast mere in which church and village are reflected, one curiosity of this place is the old-fashioned "Green Man" hostelry with its panelled oak walls, carved benches and tables, and huge fireplace. But the park to the south of the mere is not *Onkley* but *Oteley*, as in p. 38 the "Hodnel" should be written the "Hodnet Road." Whilst the author justly introduces the village of Whittington near Oswestry on the score of its castle and its general picturesque-ness, we demur to the statement that this village was the birthplace of Sir Richard Whittington, thrice Mayor of London. Richard Whittington was a younger son of the lord of the manor of Pauntley in Gloucestershire in the fourteenth century, a cadet of a good family who went to London to seek his fortunes, became a thriving mercer, furnished royal trousseaux, and married his master's daughter, Alice Fitzwarren. The only connexion we can divine between Sir Richard and the Shropshire village is that Fulk Fitzwarine, the Norman knight, whose praise is in the Norman-French romances, was connected with Whittington and the Peverils.

The general aspect of Oswestry, with its many half-timbered houses, its tradition of four gates, its traces of a town wall, and its old stone house (perhaps for pilgrims) near the church, bespeaks its antiquity; but Mr. Rimmer soon leaves it for the charms of Shrewsbury, which can boast a perfect ancient English street, taking a turn at right angles in the middle with High Street. The curious gables of one house in this street project forward tier over tier in such a manner that a passenger along the mid street might touch the houses on both sides with his hands. It is called the Double Butcher's Row. Other houses, near Pride Hill and Wyle Cop, have a history, as might be expected, and our author deserves credit for having visited Shrewsbury with his Shakespeare in his knapsack; for he corroborates two or three disputed readings by appeals to topographic details. It was at Wyle Cop that Richmond slept on his way to Bosworth Field. From Shrewsbury a journey of twelve miles brings us to Wenlock, where the lodge at least of the magnificent abbey of Black Monks still survives, as well as a fine black and white market-hall. A more picturesque and historical place perhaps is Bridgnorth, one of those Shropshire towns which boasted their town houses of the country gentlemen, sufficing them instead of London for the season. It crowns a hill over the Severn, and most of its houses are ancient. The people prefer its old covered market—an enlargement of the old market-cross—brick below and of black and white above, to a new one which has been recently built; and it seems that Bishop Percy's house, still a fine specimen of black and timber in its street front, is duly prized by the natives. The only reason we can divine for the author's scanty notice of Ludlow and its "Feathers," and other kindred houses, is that that old town of the Marches is represented in many other volumes. In truth, between it and Hereford not a few villages, Orleton, Weobley, and Pembridge for example, retain timbered houses of as curious work as almost any we have ever met with. At Hereford itself the sole remnant of the Old Butcher's Row, of James I.'s date, is a very picturesque and massive house, emblematically carved over with the mock insignia of the heraldry of the slaughterhouse. At one end of it in the High Town, till forty years ago, stood the old timber-built town-hall, resting on three rows of nine arches, and built by John Abel. Passing Ross and John Kyrle's house to the left of the Old Market-place, the railway will take us by a brief route to Monmouth, where the thirteenth-century Monnow Bridge deserves careful study, as in detail it resembles the York Bars, though built for purposes of toll and not for war. It shows what Hereford with its six gates might have been but for the dulness or capidity of its corporation towards the close of last century. Though Worcester boasts a house in the corn-market where Charles I. rested after the battle, it has no such picturesque old dwelling as is the "New Inn," still existing in the Northgate Street at Gloucester, built for pilgrims whom the monks sent to visit Edward II.'s shrine at the Abbey Church. The buildings surrounded two square courts, and were ascended by two rows of steps communicating with galleries and dormitories. The house was built in 1450 by John Twining, and there is the usual legend of a secret passage into the cathedral. The materials of the interior are said to be mainly chestnut. As a parallel to the "New Inn" in its original purpose may be cited the pilgrims' hostelry at Glastonbury, still the chief hotel of the town; while, as regards its construction and arrangements, we may match it by the "George" at Huntingdon, which, like other mediæval inns in town and country, has a gallery running round an open court and approached by an external staircase.

Mr. Rimmer whisks us from one county town and district to another with a rapidly curiously contrasting with the ancient difficulties of locomotion which he describes so forcibly. From Gloucester we are transported to Cornwall, and in the old market-place and crosses at Penzance are reminded of the Rows at Totness and the quasi-Rows outside Chester. But Exeter is fuller of interest, where the houses at the corner of Goldsmith Street have a gallery or promenade (in Row fashion) over a chemist's shop, a chapel being quaintly mixing up with the buildings. An old house opposite the Cathedral stands in an irregular Row, having continuous bow windows to the story above the shop, and on the sky floor, above these, a broad balcony. Two great beauties of old Exeter were the South Gate and the Watergate—the former a low and deep archway

flanked by large circular towers, destroyed in 1819; the latter a lighter and more graceful structure, which succumbed to destruction earlier. Wells is pronounced the most picturesque city in England. To say nothing of its Cathedral and the Palace Gardens, there is an interest in the connexion with the Cathedral of the series of houses called the Vicar's Close—a long court of the fourteenth century—by a gallery over an arched gateway across the street. This gallery is approached by a flight of steps on each side, whence there is a unique approach to the chapter-house, the floor of which is raised on a vaulted room some feet above the level of the Cathedral. In North Dorset is another antique town and venerable lane, of Saxon antecedents and for three centuries a bishopric, Sherborne and its abbey. But Sherborne, besides its minster, has its market-place, a covered area in front of the "Sun Inn," which appears to have been a market-cross, built about 1500 A.D. It is not indeed so light and graceful as Salisbury Market-cross, which has its fellow in Malmesbury in the same county, the cross of which town Leland describes "as built all of stone, and curiously vaulted for poor folk to stand dry when rayne cometh. There be 8 great pillars and eight open arches, and the work is eight square; and one great pillar in the middle berith up the vaulte." The old Banbury Cross of our nursery rhymes has lately been destroyed; but a handsome market-cross of the Caroline period still adorns the market-place of Beverley, which encloses four acres; and there is a very fine one, later than Salisbury in date, at Chichester. If it should puzzle the reader to conceive what shelter a marketful of people could derive from these graceful columns and shafts, it may be borne in mind that the surrounding space was awned over on market-days, and that the cross itself served as the nucleus of numerous booths. Sometimes it is more curious to turn aside with Mr. Rimmer to such comparatively secluded towns of the older world as Rye and Winchelsea in Sussex. In the former we find the oldest church clock in England, and gabled houses in the steep, narrow, grass-grown streets; in the latter we have the *Land, Strand, and New Gates* of a borough which had once a harbour, but is now inland, and we can trace the quickly vanishing ruins of Grey Friars' Monastery. Where gates or bars have escaped the despoiler or town-improver, it is curious to note the names variously given to them. At Banbury there were St. John's Bar, Sugar Bar, North Bar, Cole Bar, and Bridge Gate. At Lincoln, a city full of interest from the Roman days till now, a postern gate connecting with the Roman wall still bears the name of Newport Gate, and is the portal of the famous Ermine Street; whilst, if we mount the city gradually from the south and from the river, we soon come to the Stone Bow, a stately gateway crowning the street, and built, Mr. Rimmer judges from its ornament, about the time of Henry VII. The south front has the Angel Gabriel carrying a scroll, and the Virgin Mary crushing the Serpent. With its Jews' house, castle, conduit, the remains of the Bishop's Palace, and John of Gaunt's Palace, it would be hard to find a city fuller of architectural interest than Lincoln; and in its waterside attractions on the Witham Bank this "vulgar Venice" is sometimes compared to Rotterdam. At York, which still retains many of its old features, the narrow wynds and the four great bars, with Clifford's Tower and the lesser posterns, illustrate the same variety of nomenclature in gateways. Having spoken of the waterside aspect of Lincoln, we may quote a kindred description of the town of Stamford:—

The streets are irregular, but well paved and very clean. Gables figure in great variety and shapeliness here, and afford many studies for an architect. The town reminds one generally of an old city on the Rhine; quaint fronts crowd each other down to the water's edge; and the red-tiled roofs break through in pleasing variety. These are reflected in the river and interspersed with trees and gardens.

The "George" at Stamford is an hostelry of high repute, one of the few that still have their signboard suspended across the street. It is singular that at Newark-upon-Trent, which has many historical reminiscences, a fine church and a ruined castle, signboards are used to distinguish the shops and not the inns.

One more specimen of domestic architecture must be mentioned—the famous "Sparrowe's House" in the old Butter Market at Ipswich, which is still in good preservation, and tenanted by a bookseller. Four oriel windows project considerably over the street, and above them runs an enormous cornice, with four gabled windows set back in the roof. The woodwork, when examined minutely, may seem rude and barbaric in its ornament, but the general effect is very fine; and this old mansion of the Sparrowes, which succeeded an older house in 1567, claims to have hidden Charles II. in a curiously secluded loft after the battle of Worcester. There are the remains of ancient houses here in Brook Street at right angles to Sparrowe's house, and the gateway of Wolsey's College yet remains to tell of his disgrace, a structure of brick with stone enrichments. It consists of a bold Tudor gateway between two turrets of octagonal shape on either side, and a brick label moulding surmounting it, over which is a coat of arms between two brick niches. At this point Mr. Rimmer digresses into a survey of the most famous brick buildings in England—Hampton Court, Hurstmonceux, Charlton Hall, Kent, Holland House, Hatfield, and, above all, Sutton Place. This last is a structure of brick finished with a double sculptured platband of yellowish brick running round the top, with coins and window cases of the same. It is in form quadrangular, and encloses an area of eighty feet square, the principal entrance being a gateway with a lofty hexagonal turret at each angle, and the family (Weston) device of a tun and the initials R.W. on coins of

yellow brick. Doubtless we shall meet Mr. Rimmer again ere long in another of his pleasant architectural annuals, and meanwhile we may suggest to him that it is not necessary to exhaust the length and breadth of England to find materials for his purpose, and that if he will content himself with covering only a prescribed space, he will husband his opportunities and leave himself more worlds to conquer.

AMERICAN LITERATURE.

WE have received this month a large number of more or less interesting public documents both from Canada and from the United States. Those from the United States consist partly of Federal and partly of State Blue-books. Of the former the only one that possesses any general public interest is the Report of the Commissioners sent to the International Exhibition of Vienna*; a Report extending over several large, solid, and closely printed volumes. The American Government takes exceeding care to inquire into the legislation, the administrative machinery, and the commercial and industrial condition of every country from which it is possible that America should learn anything. Nearly every important Report upon any topic on which legislation is contemplated or recommended contains an elaborate account of the manner in which the same matter has been treated in each of the foremost countries of Europe; often of its management in English colonies, as being the communities most nearly approaching to the United States in their circumstances and ideas. It is not surprising, therefore, that a body of gentlemen sent expressly to make themselves acquainted with all the various branches of a European Exhibition wherein the manufactures, the inventions, and so much of the social condition and practical administration of different countries as can be exhibited in a material form are publicly compared, should make to their Government a very full and elaborate report upon every topic on which such a collection of objects from all quarters of the civilized world can throw light. And though the result is presented to the public in such a series of bulky volumes as might dismay even the literary courage of a German student, the Report forms a valuable cyclopædia of reference on the topics whereof it treats, to which American legislators and state-men will not fail on occasion to resort. There is probably no Government in the world so amply provided with information on every subject of social and political interest, and especially on all subjects that are likely ever to call for official or legislative action, as that of America.

Of the State Blue-books before us the most interesting is the *Census of Massachusetts for 1875*†, the results of which are comprised in four large octavo volumes of about eight hundred pages each. Any general analysis of the contents of such a work would of course be entirely beyond our scope. We may notice, however, two or three facts in regard to the statistics of population in the foremost State of New England which are either curious or significant. It is, in the first place, somewhat remarkable that while there is in Massachusetts, as in nearly all old and settled communities, a considerable excess of women, nearly the whole of this excess is accounted for by the number of widows as compared with that of widowers, the preponderance of the former being nearly as great as the entire excess in number of the female sex. This is no doubt due in part to the fact that women generally marry men older than themselves, and also live, upon the whole, a little longer. These two peculiarities taken together may well account for a number of widows over and above that of widowers, amounting to a little more than three per cent. of the entire population. Another observation, and one of much greater practical significance to those who are familiar with certain conditions of American domestic life, is the smallness of native-born families as compared with those of foreign immigrants. The number of children of foreign as compared with those of American-born mothers in Massachusetts is about as four to three. The entire foreign-born population of the State—a State which has comparatively few attractions for foreigners, being neither, like New York, the seat of a great Irish colony which perpetually attracts Irishmen to itself, nor, like the communities of the West, presenting broad tracts of unoccupied or half-occupied fertile land to the choice of the agricultural settler—is twenty-five per cent. of the whole, a very considerable proportion under the circumstances. In Massachusetts, as in this country, the tendency of the population to gather in large towns is very marked, there being now a slight majority in favour of the towns, whereas in 1865 these only contained about two-fifths of the entire people of the State.

The Canadian Blue-books much resemble our own in character, and possess comparatively little literary interest. The only one now in our hands which is likely to command the attention of English readers is a very thin Blue-book‡ containing the correspondence relative to that Pacific Railway scheme which has

* *Reports of the Commissioners of the United States to the International Exhibition held at Vienna, 1873.* Published under direction of the Secretary of State, by authority of Congress. Edited by Robert H. Thurston, A.M.C.E. Vol. I. Introduction; Executive Commission; Agriculture. Washington: Government Printing House. London: Trübner & Co. 1876.

† *The Census of Massachusetts, 1875.* Vol. I.: Population and Social Statistics. Boston: A. J. Wright. London: Trübner & Co. 1876.

‡ *Correspondence relating to the Canadian Pacific Railway.* London: Trübner & Co.

excited so much dispute between the Eastern and Western colonies, and has seemed to threaten the disruption of the Dominion.

Of literature, properly so called, our supply is somewhat scanty; but we have one exceedingly interesting historical work—a statement of the Southern side of the controversy respecting the treatment of prisoners during the Civil War, with especial reference to the case of Andersonville, where the worst ill-usage of the Federal captives was said to have occurred. The execution of Wirz, the unhappy officer responsible for the management of this great prison, gratified the animosity of the North, and was necessary to give the appearance of truth, or even of sincerity, to the accusations so lavishly made by the Federal authorities. But it was at the time, and is still, universally regarded in the South as a cruel and wanton murder. We think that no one can read the present volume* without feeling that, whatever may be said on the Northern side as regards the actual sufferings of the prisoners at Andersonville, the commander of the prison was not personally responsible for anything more than a somewhat extreme severity of vigilance, rendered almost indispensable by the very large number of prisoners confined and the small means of restraint at his disposal. The writer makes clear, in the first place, the one great and critical fact to which we have many times referred as decisive of the general merits of the controversy. There were fewer Confederate prisoners in the North than Federal prisoners in the South. The North had ample means of security, fortresses and camps whose construction rendered escape exceedingly difficult, and took away all those excuses for peculiar severity which were furnished to the guardians of Southern prisoners by the weakness of their material means of restraint. The North had, moreover, any number of soldiers at its disposal for the purpose of guarding the prisoners, so that it was not compelled to resort to anything like terrorism to overawe the natural disposition of prisoners to attempt a forcible escape when the guard is weak in numbers and the prison itself is far from strong. Moreover, whereas the Southern Government was closely limited in its choice of situations for prison camps by the difficulty of finding points inaccessible, at least during the later years of the war, to invading armies or rapidly moving bodies of cavalry, the Northern prisons were all of them absolutely inaccessible from first to last to any attempt at rescue from the South; and the only effort of the kind that was ever made was directed against a prison on the frontiers of Canada. Finally, the North had abundance of all sorts of food, clothing, and medicine, in all of which the South was so deficient that her own soldiers were ragged and starving. Nevertheless an absolutely larger number of prisoners died in the North than in the South, and of course the percentage of deaths was even more disproportionate than the actual numbers. This fact alone shows that of wanton cruelty or neglect there must have been much more in the North than in the South. The case of the Southern captives frozen to death in a railway train may still be within the memory of some of our readers. The instances of needless severity collected in this volume, and arrayed page after page to prove the deeper guilt of those who put Wirz to death for his alleged cruelties, are painful to read. But the evidence amassed is conclusive as to the wanton cruelties inflicted on thousands of defenceless captives. No such case of shameless violation of all the laws of war as the imprisonment of General Morgan and his comrades as malefactors in the Ohio Penitentiary has even been alleged against the South. Many of the charges against Wirz are shown to have been exaggerated or unfounded; many more are proved to have arisen out of mistakes or wilful misrepresentations. The selection of fortresses and camps in the coldest situations of the North for the imprisonment of Louisianians, Alabamians, and Floridians accustomed to a semi-tropical climate, was not, as were the alleged cruelties of Andersonville, the unauthorized act of a subordinate, or the accident of a difficult situation, but the deliberate determination of President Lincoln and his Cabinet. The mere statistics of the mortality among prisoners ought at once to have silenced the Northern accusations. After the publication of the volume before us, we hope that Northern historians will be afraid, if they are not ashamed, to repeat them.

A history of that which its victorious enemies now call the Slave Power in America† might be interesting and valuable if written by a man of moderate views and tolerable candour. To Englishmen such an account proceeding from a partisan of the South might be exceedingly useful; for Englishmen as yet have for the most part heard only the anti-slavery side of the case, and are perfectly ignorant of the grounds on which the South rested political pretensions which seem to ordinary European readers most offensive and unreasonable. But such a work undertaken by a violent Abolitionist, and performed in that spirit of bitter political antipathy and assumed moral superiority which characterizes the Abolitionist or negrophile party throughout the world, is worthless. It contains nothing either in the way of fact or of argument that we have not heard before, and it tends only to darken still further a subject upon which English and Northern ideas are, at best, sufficiently obscure and one-sided. And, of all Abolitionist partisans, it would

* *The Southern Side; or, Andersonville Prison.* Compiled from Official Documents. By R. Randolph Stevenson, M.D., formerly Chief Surgeon of the Confederate States Military Prison Hospitals, Andersonville. Baltimore: Turnbull Brothers. London: Sampson Low & Co. 1876.

† *History of the Rise and Fall of the Slave Power in America.* By Henry Wilson. 3 vols. Boston: Osgood & Co. London: Trübner & Co. 1877.

be difficult to find one more utterly unfitted for such a task than the late Vice-President Wilson. The attitude of those Abolitionists who, like Garrison, refused to take part in American politics because the fundamental conditions of the Union and the first principles of the Constitution sanctioned the slavery which they were bent on overthrowing, was loyal and intelligible. But it furnished a strong argument in favour, not indeed of the morality or justice of slavery so far as the negro was concerned, but of the claim of the South to be left to herself in her manner of dealing with it, and to be placed on a perfect equality with the North in regard to the occupation of the national Territories. The merits of the long political controversy which for thirty years at least was the one dominant issue in American party conflict, and which culminated at last in the War of Secession, can never be understood by those who do not realize the circumstances under which the Northern members of the Union became free States, and their Southern confederates learned to cling to their peculiar institution. It was the influx of immigration into the North, the presence of a sufficiency of white labour there, that rendered emancipation natural and convenient to communities occupying a soil and enjoying a climate eminently suitable to the energy of the English and Teutonic races, while comparatively ill-suited to the negro. It was the climate of the South, and still more the peculiar fitness of her soil for the culture of cotton, rice, sugar, and tobacco—all of them, but especially the first three, far more easily and advantageously cultivated by negro than by white labour—that induced the Southerners gradually to modify their views of the institution of slavery, which had at the time of the Revolution been much the same as those of the North. At the time of the War of Independence both Northerners and Southerners condemned slavery in the abstract, but were not prepared to abolish it in the concrete. Circumstances operating during a quarter of a century gradually rendered emancipation, or rather abolition, easy to the North, and reconciled the South, through the action of human interests on human conscience, to the perpetuation of slavery. Moreover, the North got rid of her negroes before she abolished slavery; the South had a large negro population of which she could not deliver herself. From the first moment when the divergence of view became clearly marked to the very last the South stood solely on the defensive. She never claimed more than the Constitution had given her, than from the first she had expressly reserved—the sole right to regulate her own internal institutions, and perfect equality with the North in the common Territories. Whatever might be the natural and moral objections to slavery, however strong might be the revolt of the conscience of Christendom against the institution, however clear might be the right of foreigners or of Southerners to denounce and assail the institution, the North and Northern citizens, so long as they remained in the Union and enjoyed its advantages, were bound by the most express engagements, and by the advantages they enjoyed in consideration of that obligation, not to interfere with slavery in the South, not to attempt to exclude slave-owners and their property from the common Territories, and to return fugitive slaves. The three volumes of Mr. Wilson's elaborate history are a continuous endeavour to obscure this aspect of the question, and to ignore the restraints imposed on the North, and the claim given to the South, by the express stipulations and the general spirit of the Union and the Constitution.

Mr. Albert Brisbane has just given to the world the first volume of a series which he calls sociological*—a work which claims to be a general introduction to social science, but which is really a vindication or panegyric of that particular form of socialistic extravagance which owes its origin and its popular name to Fourier. Any one who cares to master the special characteristics of one among a hundred forms of a multiform error may find in this volume a sufficiently clear statement of Fourier's system as modified by Mr. Brisbane's own idiosyncrasies. Americans generally are too imperfectly acquainted with true political economy to gain much from a study of one of the many varieties of anti-economic error, and few English readers have leisure or inclination to pursue into their details the vagaries of one of the wildest of French revolutionary philosophers.

The volume in which a friend of the author has collected, under the title of *Philosophical Discussions*†, a variety of papers chiefly contributed to reviews and periodicals by a young American philosopher of considerable merit, deserves the attention of those who are interested in the various controversies, physiological, philosophical, cosmogonical, and theological, which have branched in various directions out of the views of Mr. Darwin, Mr. Mill, and Mr. Herbert Spencer. Mr. Chauncey Wright was a thoughtful and profound, but not a luminous or fluent, writer. His thoughts are arranged in logical order, and expressed in highly technical scientific language; but they are not likely to be easily appreciated by a hasty reader. His papers are, in short, addressed to men of science or to professional metaphysicians. Harder, drier, and duller reading a student in quest of literary penance could hardly desire.

A brief historical study of the life and career of Alexander Hamilton‡, though it contains little that is new, even to the

ordinary reader not thoroughly familiar with the details of the political history of the American Revolution, may still be read with interest by all who care to refresh their recollections of one of the most eminent, and certainly not the least amiable, of the leaders in a mighty movement ending in the creation of a great empire. Had not his life been prematurely cut short by the malice of a personal enemy, Mr. Hamilton might have been remembered as the most distinguished among the successors of Washington, as he certainly was far superior to every one of those of his contemporaries who were in succession elected to the Presidential chair. Mr. Shea's sketch throws little new light either on the career or the character of its subject; but neither are so thoroughly familiar to Englishmen in general that this omission need deprive the work of all use or interest.

The *Transactions of the American Medical Association* for 1876* contain of course many papers of great professional value and interest which will have no attraction for the general reader. We hope, however, that the volumes of this series, as well as the Reports of the other principal professional associations of the United States, are to be found in the libraries of our own public institutions. Some essays bearing on questions of public health have a more general value, and may be worth the attention of those non-professional readers who have taken a particular concern in such questions.

Dr. Perry's *Introduction to Political Economy*† is one of several economical handbooks recently published in the United States, where the science is much less popular than in Western Europe, and where, though we believe it is much more generally taught in schools, popular knowledge of its principles appears to be much less sound and general than in England. This volume, like its competitors, is exceedingly elementary in character, and suited rather to the merest beginners who have no intention of thoroughly mastering the subject than to students who intend to make it one of their especial studies. It is, however, sound, correct, and clear, and, should it obtain any extensive circulation, might help to dispel some of the errors with regard to the first principles of economic science which are unhappily prevalent among our Transatlantic kinsmen.

Mr. Wheelwright, originally a diplomatist of no high rank, seems to have spent a large part of his life in the development of railway communications and lines of steamers in South America.‡ The vast undeveloped resources of the States of that great continent offer such attractions to enterprise that only the persistent inheritance of Spanish perversity, Spanish sloth, and Spanish misgovernment or anarchy could have kept them so long in their present backward condition. The principal department of labour to which Mr. Wheelwright devoted himself is one upon which the practical accessibility and consequent development of those resources in large measure depends; and we should be glad to believe that the countrymen of Señor Albórdi were as well aware as that gentleman has shown himself of the importance of such services.

A Report of the Third American Chess Congress§, held at Chicago in 1874, will no doubt be interesting to English votaries of that not very popular, but exceedingly fascinating, game. Though chess should seem to be rather the occupation of intellectual leisure than the amusement of hard-worked business men, many of the latter have been successful chess-players; and the comparative scarcity of a leisure class in America has not prevented our Transatlantic cousins from rivaling, in general success and in the production of a few transcendently skilful players, the most ardent devotees of the game in this country.

A new and illustrated edition of Mr. Howells's *Wedding Journey*|| appears to deserve a word of notice. The book is, we believe, popular in America, and is not unknown in this country. *The Jericho Road*¶ is a not very striking but simple and natural story of life in the Western States.

Mr. William Leighton has been signally unfortunate in the time of the publication of his tragedy. Had it not, by the accident of contemporaneous appearance, been brought into comparison with Mr. Tennyson's *Harold, The Sons of Godwin*** might fairly have passed for one of the best productions of the second rank of poets that have appeared for many years. It is spirited in execution, clear and powerful in conception, and the versification is something more than correct. The story is, like that of *Harold*, founded rather on Lord Lytton's novel than on the history of the time, especially as regards two of the most dramatically interesting incidents—the enforced oath to William and the relations between Harold and

THE WAR.

EVEN military critics can as yet derive little information from the reports of the preliminary operations of the campaign in the East; and it only remains certain, as at first, that the Turks, both in Europe and Asia, are outnumbered and overmatched. According to a statement which is made on good authority, the Russians began the war, for political reasons, before their preparations were entirely complete. It was known that the Porte was about to appeal to the Treaty of Paris; and the Russian Government may not unnaturally have desired to render further negotiation impossible. It matters little to the invader whether his attack is accelerated or delayed. The Turkish army shows no intention of crossing the Danube; and delay will injure the defence by causing additional expense. It is said that fever has broken out at Silistria; and perhaps disease may do the work of the enemy. No surprise has been caused by the advance of the army of Asia in the direction of Kars. It has long since been understood that the main effort of Russia would be made in Turkish provinces which may be retained after they have been conquered. It is, indeed, a point of honour to occupy Bulgaria, that the interests of the Christian population may not seem to have been wholly overlooked; but Austria holds the keys of European Turkey, and it seems probable that the German Government has made its promise of benevolent neutrality contingent on the abstention of Russia from permanent conquest in Europe. There is apparently nothing to prevent the Russians from adding to their dominions the South-eastern coast of the Black Sea; and possibly an effort may be made to acquire a port in the Mediterranean. Asia Minor has probably been to a great extent drained of troops for the necessities of the Servian war, and afterwards for the defence of the Danube. No weight can be attached to anticipations of a general rising of the Mahometan population, nor could new levies be a match for Russian regulars and Cossacks. No general on either side is known to possess remarkable capacity; but in this respect also the Russians have probably the advantage, for the Turkish Minister of War and the Commander-in-Chief on the Danube are notoriously unfit for their posts.

The controversy on the possible intervention of England in the struggle is unseasonable and premature. The country unanimously approves the refusal of the Government to assist the Turks for the present, and it is unnecessary to define beforehand the circumstances in which a neutral position might no longer be tenable. The rash and noisy advocates of war do less perhaps to endanger the national interests than the writers who eagerly assure the Russians that, as long as they stop short of Constantinople, they have no opposition to fear from England. The same optimists have in past years caused more alarm than confidence by their ostentatious professions of indifference to the progress of the Russians in Central Asia. It was not necessary to defend by force either Khiva or Turkey; but in both countries the success of the Russian conquerors involves a more or less remote danger to England. It is quite unnecessary to pledge the country to a policy of inaction which would offer direct encouragement to Russian ambition. Loud assertions of indifference to danger are rightly understood as indications of fear. Those who anxiously extenuate the risks of Russian success do their utmost to promote it, with the probable consequence of growing irritation in England, and perhaps of inevitable interference.

It was not exclusively for the sake either of the Russians or the Turks that the English Government, with the occasional and partial aid of the other Powers, strove for many months to prevent the rupture which has occurred. Only sentimental pedants applaud the wanton beginning of bloodshed as the most just and necessary war of modern times. It is strange that the conventional professions and apologies of official Russian journals should be reproduced with mawkish earnestness by credulous English partisans. The deliberate purpose which the Russian Government has held during long and illusory negotiations has now been unmistakably disclosed. The armies on the European and Asiatic frontiers of Turkey were from the first designed for the task which they are now proceeding to perform. The military convention with the Roumanian Government was concluded at the very time when Ambassadors and Extraordinary Envoys were urging in London the signature of the Protocol.

Mr. GLADSTONE is not one of those who recognize the sacred mission of Russia to extend the blessings of freedom and civilization to the oppressed Christians. On the other hand, one of his charges against the Government is that its slackness in coercing Turkey has left room for the efforts of a less disinterested benefactor. Having apparently for the time persuaded himself that the welfare of the Bulgarians is the first of moral and political objects, Mr. GLADSTONE nevertheless regrets that they should owe their approaching deliverance to a suspected patron. The fallacy of his reasoning consists in the assumption that England could have both liberated the Bulgarians and prevented the intervention of Russia. The Conference, which produced few useful results, at least dispelled the erroneous belief that the obstinate rejection of reform by Turkey was due to confidence in the support of England. General IGNATIEFF was less harsh in his language than Lord SALISBURY; and Lord DERRY had long before warned the Porte that it would be left to fight Russia single-handed. The alternative of joint or separate coercion remains; but in all probability Russia would have insisted on a share in the enterprise, and would ultimately have claimed the right of accomplishing alone purposes which would have been disclaimed and disapproved by England. The policy embodied in the Resolutions which are to be moved on Monday is not less liable to the objection that it depends on the assent of other Powers and on the submission of Turkey. Propositions which may be plausible in themselves become objectionable when they tend to encourage one belligerent at the expense of the other. Mr. GLADSTONE is undoubtedly both sincere and single-minded in his desire to protect the Christian subjects of Turkey; but his motion will be regarded in Russia as a defence of a war which is professedly undertaken for the same benevolent object. The military and political difficulties of the Porte are sufficient without a threat of repeating the experiment of Navarino, and of making some unnamed Turkish province independent according to the precedent of Greece.

The moderate Liberals and the regular leaders of the Opposition perform a painful duty in separating themselves from their former chief, whom they still admire as the most brilliant member of their party. Absorption in one favourite object or in a special process of thought is incompatible with a just appreciation of the comparative importance of political duties. Mr. GLADSTONE can for the moment see nothing but Bulgarian massacres; and he is

insensible to the imminent risk of destroying an historical English party. Less passionate reasoners prefer the cause of good government in England even to the most interesting of foreign victims of oppression. The Liberal party has, not without some sacrifice of predilections, followed Mr. GLADSTONE as far as possible even in the eccentric foreign policy to which he has of late devoted all his energies. It is unfortunate that he should find himself compelled to create or reveal a schism which will perhaps end in an unwilling coalition with the Conservatives, or in the exclusion of the Whigs from all political power. That the impending disruption will be welcomed by some of the extreme Liberals is proved by the digression of the Liberation Society, which had met to assail the Church, into a burst of sympathy with the statesman who concentrates his thoughts on Bulgarian atrocities. Some members of the same section will support Mr. GLADSTONE; but there is still a hope that the great majority of the party may share the conscientious convictions of Sir JOHN LUBBOCK, who is himself a thoroughgoing Liberal. But for the result of the Salford election, it might have been thought that the borough constituencies were ready to raise Mr. GLADSTONE to power in spite of the Conservatives and of the Parliamentary Liberals. The balance of popular feeling is still uncertain; but the disclosure of the aggressive policy of Russia will more and more tend to counteract the thoughtless excitement of the autumn. It may be hoped that the Government will persevere in the maintenance of peace; and they will certainly not practise a malevolent neutrality even at the expense of Turkey.

NEUTRALITY.

THE proclamation of neutrality has been issued in the form adopted at the time of the outbreak of the war between France and Germany; and it may be hoped that the warnings it contains will suffice to keep England and Englishmen clear of all the more obvious difficulties which the position of a neutral is apt to entail. The present war will be, to all appearance, so little of a maritime struggle that the occasions on which Englishmen are perplexed as to whether they are breaking the rules of neutrality or not are not likely to be numerous. The circumstances of the two countries are such that many of the vexed questions of maritime international law can scarcely arise. For example, no point has been more warmly contested than that as to the degree in which the destination of a ship is to be held conclusive as to the destination of the goods on board. Where the territory of one of the belligerents is so situated that contraband goods can be sent to an adjacent neutral port with the certainty that they will be forwarded to the belligerent, the ship is merely going from one neutral port to another, and yet she may be really as much helping a belligerent as if she sailed direct to his ports. Neither the Russian nor the Turkish navy, however, is likely to have ships to spare to cruise about looking for carriers of contraband, and the neighbours of the belligerents are the Powers with whom they would seek above all things to avoid raising any question. The one exception perhaps is Greece, and a neutral wishing to aid the enemies of Turkey might no doubt send arms to a Greek port, whence there might be no difficulty in forwarding them to Turkish insurgents. But Turkey is not likely to watch very narrowly any invasions of neutrality of which Greece may be guilty, as the main question whether Greece will remain neutral will continue open so long as Greece is hesitating whether its thirst for territory or its hatred of the Slavs shall guide its policy, and Turkey will hesitate to push Greece into war by scrutinizing closely small transactions in Greek ports. The question whether coal is contraband, or rather under what circumstances it is contraband, is more likely to arise, although it may be doubted whether, under the peculiar circumstances of the case, any great difficulty in determining the character of coal will be experienced. Turkey would certainly stop any coal destined for Russia passing through the Dardanelles; and it does not seem probable that Russia will have any fleet in the Mediterranean likely to make prizes. Still it is very possible that questions as to coal may arise, and coalowners in England feel a natural wish to know beforehand under what circumstances they are running a risk of capture and condemnation. A question was asked in the House of Commons on

Thursday night on the subject which took the curious shape of inquiring whether our Government would ask the belligerent Governments to state beforehand under what circumstances they would treat coal as contraband. The obvious reply was given that England did not wish to accept a prospective law laid down by belligerents. It is for the Courts of the captor to condemn or not to condemn a neutral vessel carrying contraband, and neutral Governments will await the decision of a judicial tribunal before they interfere. In the present instance, too, it may be said that it is very unlikely that any coal would be sent which was not contraband. The only purpose, or nearly the only purpose, for which coal would be sent would be to facilitate naval operations; and as the character of coal depends entirely on its destination, the circumstances would be very rare during the present war in which the destination of coal would not be sufficient to condemn it.

But there is one peculiar and novel set of puzzles in international law which the present war seems likely to start in a very remarkable degree. The rights of neutrals to navigate narrow waters in time of war appear likely to create difficulties in the discussion of which endless ingenuity might be expended. There is the question of the navigation of the Danube; there is the question of the navigation of the Dardanelles; and there is always looming in the distance the question of the Suez Canal. As usual, each question must be decided according to the peculiar circumstances of the case, and there are no general rules of international law to guide us. When it is said that the Danube is neutral, and that even in time of war neutrals have a right to navigate it, the right may be theoretically conceded, while in practice it may be impossible that it should be exercised. It cannot be maintained that the Russians and the Turks may not cross the Danube in order to carry out their military operations. If they are to cross the river, they must try to cross it in safety. The means are necessary to the end. In order to cross safely both banks must be held, and the channel of passage must be continuous. The belligerents could not cross at all if they had to open their military bridges whenever a neutral vessel wished to pass. Each belligerent, too, must be able to avail himself of all the means at his command to prevent the passage of the enemy, or to counteract the measures taken against him. The Turks are free to use their gunboats, and, where the water will permit, their ironclads, to stop the Russians when trying to cross. The surest means of dealing with gunboats and ironclads is to strew their possible path with torpedoes, and if the Turks use the former, the Russians use the latter. When once we have got to the right of a belligerent to put as many torpedoes as he likes in a river, it is idle to talk of the concurrent rights of neutrals to navigate it. The acceptance of the position that, when at war, the Turks and the Russians may cross the Danube for military purposes involves the consequence that neutral rights of navigation must remain in abeyance while the war lasts. The question as to the closing of the Dardanelles equally depends on special circumstances. Turkey has a right to blockade Russian ports in the Black Sea. Much the simplest mode of establishing the blockade is to close the passage of the Dardanelles. It might be objected to this that the Dardanelles lead to ports which are not Russian or Turkish. But, as it happens, this is only true in one single instance. If the Danube is open, a neutral vessel may wish to pass the Dardanelles in order to pass up the Danube, and so reach an Austrian port. But if the Danube is closed, and therefore a neutral vessel cannot possibly pass the Dardanelles in order to reach any but a Turkish or a Russian port. It is an accident that Turkey can establish so very easily an effective blockade; but there is no reason why Turkey should not have the benefit of the accidental advantages which nature and good fortune have given her.

Englishmen will naturally direct their chief attention to a still narrower strip of water than either the Dardanelles or the Danube, and will speculate on what rules ought to be laid down with regard to the Suez Canal. A question on this subject, too, was asked on Thursday night, and Sir STAFFORD NORTHCOTE answered that England could not possibly abandon in the time of war her right to send through it the troops she might want to place in India. No other answer could be given. If, when we are at war, we are not to send troops to India, we should debar ourselves from making the only use of the Suez Canal which is of real importance to us.

But then, if our ships are to pass in time of war through the Suez Canal, we could not expect our enemies not to try to prevent them from passing. Let us suppose that we were at war with France, and that France held Egypt as France held it in the time of NAPOLEON. It cannot be imagined that a French army would line the banks of the Canal, and remain calm and contented while they saw our ships go by under their noses. They would fire on the passing vessels, and it would be impossible to contend that they were trespassing beyond their belligerent rights in doing so. They would also try in every way to bar the passage. They would lay down torpedoes, or simply sink a ship at the entrance of the Canal. This sinking of a ship at the entrance of the Canal is really by far the greatest danger we have to fear. It is not very likely that the French or any other Continental nation will get possession of Egypt; but if we were at war, a very inferior maritime Power might succeed in barring the Canal for a time by closing the entrance. We might perhaps try to induce all maritime Powers to agree to rule that the Canal should never be closed in this way, but we could hardly hope that they would really observe the rule in time of war. Nor is there any very obvious reason why other maritime Powers should accept such a rule. It would be a rule made exclusively for the benefit of England. As the Suez Canal is a highway of universal trade, the natural rule in the interest of Europe would be that it should be preserved as a highway, whether in peace or war, and that no vessels of war belonging to a belligerent should pass through it. Even without any rule being laid down, it might seem as if any belligerent had a right to call on Turkey to fulfil the duties of a neutral, and to close to the ships of all belligerents the passage through an artificial ditch made exclusively on Turkish territory. But England declines to permit anything of the sort. Necessity compels her. She must send her troops through the Canal, without regarding the neutrality of Turkey or the commercial interests of other nations. She is strong enough to do it, and she frankly tells the world that she is going to do it. If she thus uses the right of the stronger—and there can be no doubt that she has no choice, and must use it—there seems very slight hope of persuading other nations to agree that, if they are at war with her, they will put no obstacles in her way. She cannot have the bargain all on one side; and that the bargain would be all on one side if she might send troops through the Canal in time of war, and her enemy was pledged not to stop her using this privilege, is sure to be pointed out to her if she tries to negotiate with the object of procuring such an engagement. She must rely, not on negotiations, but on her navy. If she holds the entrance to the Canal in force, she can permit, and of course would permit, the vessels of neutrals to use the Canal although war might be going on. But it is the English navy which would make the arrangement possible, just as it is the English navy which makes it possible to establish the claim that English troops shall be sent to India in time of war through neutral territory.

GERMANY.

THE Emperor of GERMANY is paying a visit, the first he has paid since the war, to the provinces which were the spoil of his great success. It is not possible that at Metz he should have any but an official welcome. Metz is a thoroughly French town, and it is a French town which is not only hurt in its deepest feelings by being transferred to a foreign Power, but is suffering much in its material interests. The French population there is very sad and very poor, and not unnaturally declines to spend any money in feting its new Sovereign. The few German residents may club with the garrison and raise a little fund to be spent in rejoicings when the EMPEROR arrives; but to most people in Metz the EMPEROR is merely an alien who, by an evil stroke of fortune, is able to do them much harm and make them very unhappy. Things, however, are very different at Strasburg. There the EMPEROR has been welcomed in a way which has been, as he himself states, a very pleasant surprise to him. Strasburg has received him as a German town might be expected to receive the head of Germany. It showed that it was becoming really reconciled to the change that has overtaken it. There is still, as the EMPEROR hints, much to be done. Strasburg, having been French for so long, could not become German in a day. But the Strasburgers are

treated by the EMPEROR as capable of seeing that it is Providence that has placed him over them, and of acquiescing in the decrees of so high an authority. Providence has equally made the EMPEROR master of Metz; but it would be idle to address the inhabitants of Metz as likely to bear their new lot more patiently if this religious argument were pressed on them. It is only when a beginning of reconciliation and goodwill has been otherwise effected, or when the hearts of a people are broken, that an invitation to look on things from a theological or fatalistic point of view has any effect. Strasburg has been drawing perceptibly closer and closer to Germany since it found that it could no longer consider itself French. The population is substantially a German one; its speech and its religion resemble those of its new masters, and the pecuniary interests of the mass of humble residents impel them to look to Germany, which is open to them, and not to France, which is closed to them. If Alsace is taken as a whole, it is probably too much to say that it is reconciled to the new order of things. The upper classes and the priests are still French in all their sympathies; but the mass of inhabitants, and especially the mass of the inhabitants of Strasburg, find it every day more easy and more natural to be regarded and to regard themselves as Germans. It may be remarked that what is now happening in the annexed provinces is very much what the Germans expected to happen when they decided on the annexation. They hoped that Alsace would before long become German in feeling, or at least would cease to be definitely French in feeling. But there was no illusion about Metz. No German hoped that Metz would be anything but a conquered French city. It was thought necessary to retain Metz for military reasons. Its possession is so very valuable for the purposes of war that, in order to attain this advantage, the Germans were willing to undergo all the annoyance which the permanent armed occupation of a foreign town must cause to those who hold it. When the EMPEROR goes to Strasburg, he goes to see a people which, if not altogether German, is being rapidly Germanized. When he goes to Metz, he goes to see his garrison, and nothing else.

It appears that the garrison of Metz is to be strengthened, and that the German force in the annexed provinces is to be somewhat increased, in accordance with the policy indicated in Count MOLTKE's speech. The reason for taking these measures is said to be that France is massing troops on the frontier. The French deny this, and certainly the detailed statement of the troops posted in that part of France does not give the notion of preparations being made which could alarm any sensible German. Metz is at this moment as safe from an attack on the part of France as Gibraltar is from an attack on the part of Spain. It is probable that the reinforcement of German troops has scarcely anything to do with war with France. It is not of the French, but of the new subjects of the EMPEROR, that the authorities are thinking when they send fresh troops into Lorraine. Those who are sad, and nervous, and susceptible will catch at very small straws on which to build their hopes; and when a body of French troops, not really large, but still considerable in numbers, is posted near the Metz district, it is not very surprising that the hearts of some of the poor unhappy Frenchmen in Metz should begin to beat high, and that they should dream that the hour of release, for which they long so intensely, is coming near. The sight of more German troops in Metz may be thought likely to tranquillize these dreamers, and to convince them that the grasp in which they are held is not to be shaken off. The Germans have not the faintest chance or hope of converting the French in Metz into Germans; but they may possibly weary and humble them into an attitude of despairing patient submission. In time the people of Metz may learn to trace those operations of the hand of Providence which the EMPEROR recognizes with so much readiness, distinctness, and pleasure. It may be necessary, if this end is to be accomplished, that the German should take those measures which Count MOLTKE has pronounced to be indispensable. But it is both unfortunate in itself, and somewhat unfair to France, that, in order to produce the desired impression on what is nominally a part of the population of Germany, measures should be needed which cause France some alarm, and serve to show Frenchmen that, whatever efforts they may make to satisfy Germany, it is hopeless to think Germany will be satisfied. Every day gives a new proof of the

extreme anxiety displayed by France not to give its dreaded neighbours cause of offence. The documents published by Duke DECAZES show that the primary object of his foreign policy through the changing phases of the Eastern question has been to avoid, not only anything that could offend Germany, but anything that could be misconstrued into an indication that France supposed herself to be in a position to give offence. So extraordinarily modest has been the bearing of those who had to carry out the instructions of Duke DECAZES, that on one occasion the representative of Austria recommended his French colleague to speak up like a man, and not be so pertinaciously humble. It is something so new in the history of Europe for a French Envoy to be reproached for being too meek, that the heart of the sternest German ought to be melted at the thought of such a change having taken place.

If it is, as Germans would like to suppose, the boasted enlightenment of Germany which is one of the chief influences attracting the people of Strasburg to Germany, this enlightenment is certainly not displayed in the treatment of financial questions. The German Parliament and the German Ministry are fast relapsing into the darkest errors of Protection. Prince BISMARCK, before his retirement, had expressed himself doubtful whether Germany could afford to forego duties intended to meet bounties given by foreign Governments on goods imported into Germany. In fair competition, he thought, Germany should win or fail as she could; but he was not sure whether Germany ought not to be protected against competitors who had a subsidy to help them. The Minister who has replaced Prince BISMARCK has got far beyond these doubts and hesitations of the CHANCELLOR. In a debate which lately took place with regard to the proposed treaty of commerce with Austria, a deputy from South Germany objected to the proposed treaty altogether, because it went much too far in the direction of Free-trade. The Minister replied that he could not arrest the progress of the negotiations, as they had advanced to a point from which Germany could not recede, but that in principle he agreed with the observations of his Protectionist friend; and he hinted that Austria might decline the proposed treaty, and then Germany would have a clear field. It became, therefore, interesting to know what were the observations which had found so much favour in the eyes of the Ministers. They were observations of a very remarkable kind. The preceding speaker insisted that all the Free-trade innovations which Prussia had accepted and introduced into the Zollverein were simply intended to injure Austria while Austria was still a part of Germany. Now that Austria had been driven out of Germany, there could, he thought, be no possible reason for Germany spiteing herself by adopting wrong commercial principles. This was quite in accordance with a view widely prevailing on the Continent, that nations which adopt Free-trade adopt it, not to benefit themselves, but to injure their neighbours. The field being open, Germany would be mad, this enthusiast went on to urge, if it did not take every opportunity of getting back into the safe and comfortable fold of Protection. Germans, as another speaker had recently insisted, cannot really compete with foreigners. English iron ore, he pointed out, has got more iron in it in proportion to the mass of ore than German ore has, and Germans cannot struggle against nature. In point of fact, he said, a number of large works in Germany have had to be closed, German capital has been lost, and German labourers have been thrown out of employment. And this was not all. Germany has actually gone further in Free-trade than England itself, which preaches Free-trade to all the world. Poor Germany admits corn duty free, while, as the South German deputy stated, with a fine boldness of invention, rich England still levies a duty on the corn she imports. That one or two deputies should hold this language is not surprising. That the interests of many consumers should be preferred to the interests of a few producers is one of those maxims which no amount of argument will din into some minds. What is wonderful is that a German Minister should say that he considered the language he listened to eminently sensible and judicious, and that he would like to give effect to the statesmanlike principles involved in it as soon as he got an opportunity of doing so. It is very disappointing; but still it seems indisputable that, as time goes on, not only does Free-trade not advance, but it is being driven out of positions which it once occupied.

AMERICA.

EUROPE may, as on many former occasions, regard America with envy. Neither the unscrupulous ambition of Russia nor the criminal weakness of Turkey disturbs the tranquillity of the happy citizens of the United States. Their own political troubles, which are always comparatively trivial, have for the present, and perhaps finally, been removed. For several weeks in Louisiana and South Carolina rival Governments and Legislatures had respectively claimed to exercise supreme authority; and in any other country it might have been expected that the quarrel would only be decided by force. Fortunately both parties welcomed the excuse for postponement of the struggle which was provided by the presence of Federal troops. The Republicans relied on the ultimate support of the late President; and the Democrats were well aware that it would be dangerous to offer open resistance to the Federal flag. On the eve of his retirement General GRANT abandoned his former policy of using the army as an instrument of the party to which he belonged. The officers in command were instructed to maintain order, and to abstain from all interference with local quarrels. Both parties waited to see the result of the Presidential election; and when Mr. HAYES was chosen, it was still thought expedient to await his announcement of his intentions. The Southern Republicans felt a not unnatural confidence in a President who owed his election to the frauds of the same Returning Boards from whom PACKARD and CHAMBERLAIN derived their titles. On the other hand, the Democrats quoted the conciliatory language which was used by Mr. HAYES immediately after his nomination; and they justly calculated on the unwillingness of a civilian and a lawyer to repeat General GRANT's employment of military force for political objects.

There can be little doubt that Mr. HAYES determined from the first to recognize the Democratic Governors and Legislatures, not perhaps so much because they had probably been elected by lawful majorities, as on the ground that they represented the property and intelligence of their respective States. The tranquillity and loyalty of the South could only be ensured by the reversal of the revolutionary process which had turned political society upside down. The Southern whites are Democrats because their enemies belong to the Republican party; but their real grievance was their subjection to an inferior race. Mr. HAYES has, according to the sound American custom, based an enlightened policy on nice legal distinctions. In the case of the President himself, it had never been formally decided that the Republican party had carried the disputed elections. The Joint Committee expressly based their judgment, as it was framed by the Republican majority in their body, on the constitutional inability of Congress, or of any tribunal appointed by Congress, to inquire into the validity of the State returns. The decision was probably consistent with law, though it was evidently influenced by party feeling. The President was therefore at liberty to treat the disputed State elections as new cases not affected by the judgment of the Joint Committee. His first attempt to settle the controversy was the appointment of a Commission which endeavoured to effect a compromise between the contending parties; but, as it was evidently necessary to surrender all or nothing, the exertions of the Commissioners were fruitless. It therefore became expedient to devise some other method of recognizing the Democratic authorities; and the object was attained by the simple process of withdrawing the Federal troops both in New Orleans and in Charleston. Mr. CHAMBERLAIN and Mr. PACKARD, with their respective Assemblies, immediately admitted their inability to prolong the contest; and Mr. WADE HAMPTON and Mr. NICHOLLS now hold office by an undisputed title. The confident prophecy of observant politicians that the whites would eventually resume their natural supremacy has been quickly and completely fulfilled. There is reason to hope that they will cultivate friendly relations with the coloured people, although they formerly expressed resentment at the usurped predominance of the most incapable section of the community. The termination of the struggle will tend to restore the ancient attachment of the Southern States to the Union. Those who were not long since stigmatized as rebels now enjoy perfect equality with their former adversaries; and a Confederate General

has been confirmed by the action of a Republican President in the government of his native State.

It is not yet known whether the impartiality displayed by Mr. HAYES will secure him the support of Northern or Southern Democrats. In the United States, as in England, it is easier for politicians to change their opinions and conduct than to separate themselves from their party. It is not even certain that Mr. HAYES would derive strength from an alliance which might alienate the supporters to whom he owes his election. His judicious concessions to the South have already furnished indignant and disappointed Republicans with a pretext for opposition. The BLAINES, the BUTLERS, and the CAMERONS, who still hope to retain the direction of the Republican party, have denounced the PRESIDENT as a deserter from his flag. At the meeting of Congress they may perhaps succeed in embarrassing the Government, unless the Democrats have the good sense and the patriotism to decline combinations directed against a President to whom they are of late greatly indebted. It is possible that the schemes of the malcontents may be baffled by proposals on the part of the PRESIDENT which will be even more distasteful to the corrupt section of his party than his compromise with the South. Mr. SCHURZ, Mr. EVARTS, and the PRESIDENT himself are believed to be thoroughly earnest in their intention of reforming the Civil Service. Permanence in the tenure of office, and preference of merit, would be destructive to the political fabric which has been carefully elaborated by both parties, since President JACKSON excited the enthusiasm of his followers by declaring that the spoils belonged to the victors. It is not even certain whether it will be possible to keep parties together when the efforts of political managers are no longer rewarded by the disposal of patronage; but the Constitution will adapt itself to the changes which may involve the discouragement of jobbery and corruption. The most violent Republican journals have acquiesced with unexpected facility in the PRESIDENT'S Southern policy. Perhaps they may be equally pliable when he begins the reform of the Civil Service.

Possible schisms in political parties occupy the attention of the American community more faintly than the prospects of industry and commerce. The long-continued stagnation of trade has not yet reached its termination; and it may be doubted whether even the lucky incident of a European war will restore material prosperity. For some time past the tide of emigration has changed its direction; and it is said that large numbers of American farmers and artisans are removing to Australia. No definite plan has yet been devised for the resumption of a specie currency, and the grossest economical fallacies still determine the course of commercial legislation. The Americans are a cheerful and sanguine nation, and it seems that the war between Russia and Turkey has been hailed as the probable cause of a revival of trade. The Turks have bought large quantities of munitions of war in the United States, and the Russians also are expected to be profitable customers. It is still more certain that, while the war lasts, the export of corn from Russia will be either prevented or diminished; and the Western farmers are prepared to supply any deficiency which may occur. The ancient friendship of the United States and Russia has always been most loudly proclaimed when it seemed expedient to express less cordial feelings to England. At present the animosities of former times have fortunately subsided; and no sentimental regrets will disturb the satisfaction of superseding Russian commerce in foreign markets. The advantage of an unassailable position, of enormous reserves, and of facilities for profiting by the misfortunes of other nations, may well fill the minds of American citizens with patriotic complacency and pride.

THE FRENCH GOVERNMENT AND RELIGION.

THE first day's debate in the French Chamber on M. LEBLOND'S interpellation was only important as showing the extremely narrow view which M. JULES SIMON takes of religious matters in France. There was an opportunity for him to make a speech which, if it had not reassured the Conservative Republican party, might at least have been well calculated to do so. It is hard to say what would really reassure them, for they seem to be rapidly falling back into that condition of combined indifference and terror from which the suppression of the

Commune for a time delivered them. A Correspondent of the *Standard* gave the other day what purported to be an analysis of certain confidential reports lately addressed to the Government by the Prefects. There is no particular reason to suppose that French officials ever make things more unpleasant for their superiors than is necessary; and unless the Prefects have for once disregarded their general rule, the prospects of the Republican party are not encouraging. All that the circumstances of the Bordeaux election portended is fully borne out by their statements. Everywhere in France there are two small and furious minorities, and one large and supine majority. The moderate Republican party—the party, that is, which is willing to accept any political institutions which will secure the country the essential conditions of good government—is everywhere numerous and everywhere worthless. For all purposes of self-defence it is no better than a flock of sheep. It is not only military courage that is wanting to it—that, with a strong Administration, would be comparatively of little moment—but civil courage is equally absent. The supporters of the Government will not take the trouble to support it. They will not put forward candidates representing their views, and when candidates are put forward on their behalf, they will not go to the poll to vote for them. All that readiness to show their confidence in the Conservative Republic which seemed a year or two ago to be slowly growing up among them has passed away. The true French Conservatives—the Conservatives who genuinely wish to keep the institutions which they have under the present Constitution—have either changed their mind or ceased to give it expression. The explanation of this revolution of feeling is not far to seek. They have ceased to believe in the Conservatism of the existing Republic. They had no objection to M. JULES SIMON when he was a Minister under M. THIERS; but M. JULES SIMON with no one above him is a very different person in their estimation. The Conservative Republic as it was under M. DUFAYE was a Government that it seemed worth while to take some trouble about. The Conservative Republic as it is under M. SIMON is too much like the Radical Republic to move them from the indifference which down to 1870 was their habitual attitude in politics. They see that in the Chamber of Deputies the Government can only gain the votes it needs by keeping on good terms with the Left; that all pretence on the part of the Right of supporting either the Administration or the PRESIDENT has been abandoned; that the MARSHAL has at length become, what they were assured he never would become, a constitutional ruler who takes patiently whatever Ministers the Chamber chooses to impose upon him. The Left had their own way in the formation of the existing Cabinet; but they bought their victory at a tremendous cost to the Republic. The Left Centre, that Left Centre which under M. THIERS was said to be identical with France, seems to have vanished into air. Its place is filled by furious factions and by a dull mass of political torpor which idly waits to see what the factions are going to do with the country.

Whether M. SIMON has it in his power to give the Conservative Republicans any consoling reassurance of the strength of the Government is, as has been said, exceedingly doubtful. But he might have made the attempt; and had he done so he might, by a happy accident, have been successful. At all events, what the situation demanded from him was a clear and positive statement that the Government would make the law respected by both extremes, and that, if the law proved insufficient to restrain both extremes, the Government would propose new laws. It is true that at the end of his speech he did say something of this kind; but its effect was entirely destroyed by the long exposition of his views about the POPE'S position towards the Italian Government with which he prefaced it. M. SIMON'S usual tact seems to have deserted him; for he argued as though he really hoped to convince the Right that the POPE is as free as they can wish him to be. To take this line was, in a sense, to admit that French Catholics have a right to make the domestic policy of the Italian Government a subject of debate in their own Legislature. If it is open to M. SIMON to argue that the POPE is not a prisoner, it must be equally open to a Catholic deputy to argue that the POPE is a prisoner. If M. SIMON thought it prudent to adopt this tone, he might at least have discussed the latest aspect of the controversy. Even if the Right had been disposed to be convinced, nothing would have been gained

by reading extracts from the Italian Law of Guarantees; because the present contention between the Pope and the Italian Government is not whether these guarantees are adequate, but whether they are genuine. The Pope, and a good many other people beside the Pope, think that the present Italian Cabinet has taken a line in religious matters which is altogether destructive of the Law of Guarantees, and there can be no use in going into the subject at all if this part of it is left out of consideration. It would have been enough for M. SIMON to say that the acts of foreign Governments are not a proper subject of debate in the French Chambers, unless they have an international character, and that all attempts to make them a subject of debate, whether by motions in the Legislature or by petitions to the Government, or by pastorals from bishops to their flocks, would be repressed by the measures appropriate to each kind of effort.

But M. SIMON might have said this, and yet, if he had said no more than this, have done no good to the Government. The Right have a religious grievance as well as the Left, and M. SIMON ought not to have undertaken to repress Catholic petitions and Episcopal pastorals without undertaking at the same time to repress obscene and blasphemous journals. There can be no question that the number and boldness of these publications has of late greatly increased. It is often, of course, a very difficult question whether it is wise to take any notice of such writings. Where, as in this country, the good sense and good feeling of the public are only disgusted by them, it is usually best to leave them to run their obscure course without interference. But in France the case is wholly different. These writings are accepted by large numbers of persons as the natural expression of Radical opinion on religious questions, and to a certain extent they are rightly accepted as such. That is to say, a section—and that the noisiest, the most energetic, and the most dreaded section—of the Radicals do hold the kind of opinions symbolized by the writings in question; while the larger and more moderate section, instead of doing all they can to show their reprobation of the indecencies duly published, observe absolute silence on the subject, and keep all their denunciations for the excesses on the other side. It is not wonderful, therefore, that the conviction should be extending in France that the position maintained alike by the extreme Radicals and the extreme Legitimists, that there is an inevitable and incurable antagonism between the Church and the Republic, is after all the true position. In so far as this conviction becomes accepted the prospects of the Republic will decline. Whatever may be the moral or theological value of the religious reaction which is undoubtedly a reality in France, the Church is still regarded as the greatest of Conservative institutions; and if the country has to choose between the Church and the Republic, it will not choose the Republic. M. JULES SIMON can hardly have any doubt upon this point, and it is strange that he should not have seen that his true policy was to try to convince the country that, in spite of what is said by the extreme Catholic party, the Republican Government are able and ready to protect religion against the vulgar brutalities of which it is daily made the object in numberless newspapers. That he has let the occasion go unimproved will be remembered against him if he hereafter makes, in answer to an interpellation from the Right, the sort of statement which, had he been well advised, he would have made without an interpellation on Thursday.

THE IRISH LAND DEBATE.

THE O'DONOGHUE's motion for depriving Irish owners of their property in land furnished an instructive comment on the Home Rule debate. Mr. BUTT's followers, being a majority of the Irish members, are compelled by their constituents to concur in the agitation against Irish landlords. If it were possible to suppose that Parliament would at any time abdicate a portion of its functions in favour of a provincial Assembly, some effort might perhaps be made to stipulate for the preservation of landed property; but, with or without restrictions, an Irish Parliament would, in one of its earliest Sessions, concede fixity of tenure to occupiers. The next step of suppressing the rent charge which might in the first instance be reserved to the former owner would not be long delayed. In the debate on The O'DONOGHUE's motion Mr. BRUEN called at-

tention to the apparent inconsistency of demanding at the same time that the landlord should be prohibited from eviction and that the tenant should possess the absolute right of selling his interest to the highest bidder. Anomalies always admit of explanation; and the language of the Irish agitators is perfectly intelligible. The petty farmers who return a large section of the Irish members value legislation exclusively as a mode of benefiting themselves; and they desire Home Rule or separation chiefly because they are at present controlled by the English and Scotch majority in Parliament. There can be little doubt that those Irish members who are interested in land gladly find themselves outvoted when they attempt to facilitate the expropriation of the class to which they themselves belong. Several speakers, while they ostensibly supported the proposed inquiry, expressed their dissent from the inflammatory language of the mover, who apparently thought it necessary to atone by his violence for an impolitic assertion of his independence in opposing a Home Rule Resolution in 1874. It is of course possible that an advocate of fixity of tenure may disapprove of Home Rule; but he must be well aware that, as long as the United Kingdom is governed by one Parliament, his aspirations for the emancipation of tenant-farmers are not likely to be gratified. Conversely, a zealous Home Ruler who wishes to protect landlords against spoliation ought to understand that he cannot at the same time promote two opposite results. It is indeed comparatively safe and perfectly easy to advocate two inconsistent systems of policy in an assembly which is not at present disposed to favour revolutionary members.

LORD HARTINGTON displayed less than his usual caution when he suggested the possible expediency of an inquiry into the relations between landlord and tenant in Ireland. By entering into such an investigation Parliament would countenance the expectation of concessions to the occupiers and the agitators who represent them. LORD HARTINGTON himself is certainly not inclined to sanction any measure which would satisfy The O'DONOGHUE and his adherents. Only one English member took occasion to recommend the entire abolition of freedom of contract between landlord and tenant. Mr. SHAW-LIFFEYRE professed his inability to understand why all tenants should not partake of the advantages which were conferred by the Land Act of 1870 on occupiers paying less than a specified rent. The strongest objection to the measure was that it introduced an exception to the general rule of freedom of contract. Mr. GLADSTONE defended his proposals on the ground that small occupiers, not being practically independent, required legal protection; and even in a Parliament elected chiefly to fell the Irish Upstart, it would have been impossible to carry the Land Bill unless its provisions had been regarded as exceptional. It was always stated by Mr. GLADSTONE, and it was distinctly understood, that the Bill only applied to the poorer class of tenants. Mr. SHAW-LIFFEYRE, in proposing to extend the claim for damages on the ground of disturbance to all occupiers, large and small, adopts a novel theory which is as applicable to England and Scotland as to Ireland. In an agreement for a lease of longer or shorter duration the tenant takes the risk of eviction at the end of the term; and the theoretical uncertainty of his tenure forms an element in his bargain. Mr. SHAW-LIFFEYRE would confer on the tenant an advantage to which he is not at present entitled by compelling the landlord to pay damages for insisting on the strict fulfilment of the contract.

The difficulties which attend legislation on the delicate subject of land have been illustrated by the results of the Encumbered Estates Act which was passed thirty years ago. The measure was proposed by Sir ROBERT PEEL, and it was afterwards passed in a more comprehensive form by Sir JOHN ROMILLY, under the administration of Lord JOHN RUSSELL. Much of the distress which then prevailed in Ireland was attributed to the embarrassed state of the landlords, who were, it was said, induced or compelled by their own necessities to exact the utmost amount which they could raise from their tenants. Under the provisions of the Act large transfers of property have taken place, with the anticipated result of substituting responsible and solvent owners for the needy landlords of former times. Only a few English capitalists have been induced to invest their money in Irish land. Some of the native purchasers have acquired extensive estates, and the traders of the towns have in many instances become small proprietors. It has since been found that the new comers of all classes are more unpopular than their predecessors. The spendthrifts of a

former generation were better understood by their rural neighbours than the intelligent men of business who naturally seek for a fair return for their outlay. Purchasers who had secured an indefeasible Parliamentary title now find that they have to deal, not only with malcontent tenants, but with legislative theories which disturb in a greater or less degree the established rights of property. They were compelled to submit to Mr. GLADSTONE'S measure for the protection of small tenants; and now they are threatened with the institution of tribunals which are to assess the rent on a tenant who can in no circumstances be dispossessed. Mr. SHAW-LEFEVRE would impose a heavy fine on a landlord who, after letting his land to a tenant possibly richer than himself, seeks to recover possession, even for the purpose of occupying the land himself. For the present the great majority of the House of Commons is opposed to compulsory expropriation.

Those who defend the rights of property as they have been established by law and custom incur a disadvantage by being forced to engage in controversy. An apologist, even when his case is unimpeachable in principle, admits by entering on his defence that his position has in fact been assailed. If the right of private property is admitted to be an open question, many plausible reasons may be urged against it. The justification of taking absolute ownership for granted is that it is the indispensable condition of society as it exists. Some form of communism may perhaps hereafter be preferred; but in the meantime investments in land ought in ordinary times to be as free from interference as investments of any other kind. Social and economical evils apparently resulting from the distribution of property may sometimes require arbitrary redress. Mr. GLADSTONE'S Land Act was only justified by circumstances, and especially by the universal discontent of the smaller Irish occupiers. There is no reason to believe that distress now prevails in Ireland; and the discontent on which agitators trade takes the form of a hope of gain rather than of resentment produced by suffering. No sufficient explanation was given in the late debate of the limited operation of Mr. BRIGHT'S celebrated clause; nor perhaps will further information be elicited by the Select Committee. The CHANCELLOR of the EXCHEQUER is perhaps too ready to concede inquiries which assume that there is some wrong to be remedied. The reason that tenants seldom buy their farms is probably that they prefer a freehold, which they expect as a gift, to a property which must be paid for. No wise man would voluntarily become an Irish landlord, and perhaps it is better to be a yearly tenant with practical certainty of permanent tenure than a freeholder who has purchased his land. To Englishmen it seems desirable to increase the number of freehold occupiers; but Irish farmers probably understand their own interests. It is not surprising that the market price of Irish land is low in proportion to the rental. The delusion that it would be possible to introduce English customs into Ireland has been dispelled by the results of the Encumbered Estates Act. A capitalist who in the present day invests his money in Irish land must be strangely indifferent to vexation and discomfort. Every debate on the land laws diminishes the inducement to become or to remain an Irish landlord.

THE CATTLE PLAGUE COMMITTEE.

THE whole proceedings of the Government with regard to the Cattle Plague Committee are mysterious and inscrutable. It is not easy to say why the idea of appointing a Committee was first entertained. As Mr. READ said on Thursday, there is no reason to suppose that its investigations will put the Government in possession of any facts that it does not know already; and Lord SANDON must be of a more than commonly hopeful disposition if he expects that his course will be made in the least clearer by the Committee's recommendations. The members will for the most part end the inquiry with the same convictions with which they began it. Indeed their claim to a seat on the Committee is avowedly founded neither on special knowledge nor on exceptional powers of arriving at truth, but simply on their representing this or that interest. Interests are not converted by hearing evidence, and when the last witness has been examined, the member who knows that his constituents are large buyers of cattle from abroad, and the member who knows that his constituents are large breeders of

cattle at home, will still hold opposite opinions as to the propriety of prohibiting importation. The one consideration for the Government is whether, having regard to the country at large, the meat supply will in the long run be most benefited by allowing importation and taking the risk of a consequent diminution in the home supply, or by abolishing importation, and taking the certainty of a consequent cessation of the foreign supply. All the data which can be of any use in coming to a conclusion on this point are already at Lord SANDON'S command; and, if they were not, he would get at them much more quickly by talking over the matter with a few representative experts than by comparing together the competing reports of the various sections of the Select Committee. Supposing that it was considered expedient to have a Select Committee, the next puzzle is why the Government did not set about appointing it rather sooner. Whether the subject was or was not sufficiently doubtful to make an inquiry by a Committee useful, there seemed to be no question that it was sufficiently important to make any delay in the nomination of the Committee exceedingly undesirable. The cattle plague shows no intention of waiting for the Committee. One outbreak after another is recorded and dealt with, and yet the Government postpone considering how it is to be dealt with. No way could have been suggested more likely to cause the confusion in which the debate of Tuesday ended. There was time for any one who wished to embarrass the Government to take counsel how it could best be done, and the apparent unwillingness of the Government to begin their work naturally suggested that they felt some doubts as to their capacity of carrying it through. The delay had also the effect of making the discussion seem less important than it really was. People are apt to think that what may be done equally well to-day or to-day fortnight need not be done at all; and, when once they are in this temper, the incidents of the debate are likely to take more hold of them than the end for which it has been started. On Tuesday the House of Commons was very much less occupied in considering how to keep the cattle plague out of the country than in considering how to keep Mr. BIGGAR out of the Cattle Plague Committee.

In this all-important object the House was completely successful. It had to sacrifice time and labour in achieving the result, but at all events the result was achieved. Mr. BIGGAR'S name was before the House for hours, and it was found as potent in wasting time as Mr. BIGGAR'S bodily presence. He could not have been more completely master of the situation if he had spent the whole evening on his legs. Lord SANDON began by moving that the Committee should consist of twenty-three members, upon which Mr. BUTT moved that it should consist of twenty-seven. There can be no doubt that a Committee of twenty-seven members is a most unwieldy machine; but, as between twenty-three and twenty-seven the difference was not great enough to be worth fighting about, Lord SANDON conceded the larger number, and conceded also that three out of the four additions should be Irish members. He was then challenged to say which Irish members he proposed to take, and, after some beating about the bush, it appeared that his choice had fallen on Mr. KING-HARMAN, The O'CONOR DON, and Mr. A. MOORE. From that moment the cattle plague was forgotten, and the discussion resolved itself into a struggle over the body of Mr. BIGGAR. Mr. BUTT was willing to have Mr. KING-HARMAN, and did not object to Mr. A. MOORE. But he was determined that Mr. BIGGAR should be the third, and in this he found more supporters than he perhaps expected. The question was formally decided after the twenty-three names originally proposed by the Government had all been accepted; but it was discussed informally long before that point had been reached. At length, however, the House had what it desired—an opportunity of going to a division on Mr. BIGGAR'S merits. Mr. BUTT moved that he be added to the Select Committee, and at once, without, as it seems, any debate, the members filed off into the lobby. Mr. BIGGAR'S name was rejected by 113 votes against 90. But to reject Mr. BIGGAR and to get rid of him are by no means the same thing. As soon as the cheers which welcomed the announcement of the numbers had died away, Mr. SULLIVAN moved the adjournment of the House, and when this was rejected, Mr. CALLAN moved the adjournment of the debate. As seventeen members were found to support the latter motion, it was evident that similar adjournments would be moved as long

as might be requisite, and thereupon the Government gave way, and the House went to bed with the Committee still incomplete.

It was both unfortunate and ill-judged that Mr. BIGGAR should be made of this importance. The Irish members may have been ill-advised in choosing him for one of their representatives on the Select Committee; but when once their choice had been made there was no object in opposing it. It is only natural perhaps that, when the Government gave the House the opportunity of revenging its wrongs by voting against the author of so much delay and so many late sittings, a majority of the members should be found to vote against him. But the Government itself should have been above any feeling of the kind; and, unless there was some strong reason, either of propriety or convenience, for opposing Mr. BIGGAR's nomination, they should have accepted it at the hands of Mr. BUTT. By refusing to do so they enabled Mr. BIGGAR to take a very much higher position than he had before been able to attain to. Down to Tuesday last he had only represented himself, or at most himself and Mr. PARNELL. On Tuesday he became for the time the representative of the Irish members. Mr. BUTT, who had publicly lectured him for his obstructive tactics, had included him in his list, and, as soon as it appeared that the Government intended to oppose his nomination, all that followed became inevitable. If Mr. BIGGAR had broken the rules of the House, or acted the authority of the SPEAKER, or insulted another member in the lobby, the refusal of the Government to add his name to the Committee might have been justified. But he has done none of these things. It is true he has strained the rules of the House to the utmost; he has made the SPEAKER's life a burden to him; he has made the majority of the members regard him as their natural enemy. Still in all this he has been acting within his rights, and so long as a member does this there can be no need to keep his name off Select Committees unless there is reason to suppose that his presence will tend to defeat the object for which the Committee is appointed. It may be said that this would have been the case with Mr. BIGGAR; and that, as he has exhausted all legitimate modes of delaying the business of the House, so he would exhaust all legitimate modes of delaying the business of the Committee. It may be doubted, however, whether the procedure of an inquiry before a Select Committee could afford any opportunities of the same kind as are afforded by the procedure of the House of Commons; or whether even Mr. BIGGAR's courage would be equal to repeating, before twenty-six colleagues, in a room from which strangers can be excluded, the performances which have immortalized him in a larger and more public arena. At all events, the Committee's loss might have been the House's gain. We have Mr. PARNELL's authority for believing that a member who has to keep awake at noon is scarcely likely to be moving adjournments after three P.M.

VIVISECTION.

IT may be hoped that the discussion of Mr. HOLT's Vivisection Bill in the House of Commons, and its prompt and decisive rejection by a large majority, will lead to the cessation of a very injudicious and unseemly course of agitation. Without in any way disparaging the humane motives of the opponents of the existing legislation on this subject, it must be said that they have made a great mistake in the course which they have lately pursued. There seems to be at the present time a tendency among a certain class of people to a kind of sentimental excitement on various subjects which is detrimental to calm and reasonable reflection. The ignorant and fanatical antagonism which is displayed in regard to vaccination is a conspicuous instance of this distemper; and so is the onslaught which the more violent anti-vivisectionists have made on the medical profession. It is not perhaps generally known that papers of a most malicious, and in some cases libellous, character have been widely circulated, and unwarrantable invasions of domestic privacy have been made, on behalf of both these movements. Post-cards of a bitterly personal and denunciatory tone, inquisitorial visits, and all sorts of aggressive pressure have been used in order to influence and, it may be said, intimidate weak minds on these questions. In various parts of London the blank walls are just now placarded with sensational illustrations of the alleged horrors of vivisection, and

appeals to popular passion. There is, for instance, a large picture of a dog and rabbit as they are supposed to be when arranged for dissection, with the question underneath whether such "Agony"—this word is in large capitals—can be allowed to be inflicted on sensitive and innocent animals for pure selfishness; and there is another bill, in which the inquiry is made, "Have you lost your cat?" which is followed up by a reference to evidence in the Blue-Book of last year which, it is suggested, will supply an explanation. In other cases the strongest possible charges have been publicly brought against the medical profession by persons who, when put to the test of examination, have positively declined to substantiate their statements by producing any evidence. It is true that such people are not a fair example of the more moderate and reasonable class which has doubts of the efficiency of the restrictions at present placed on the abuses of vivisection, and would like to see those restrictions made more stringent on certain points; but it is one of the mischiefs of a system of wild, hysterical agitation that it tends to excite feelings which are unfavourable to the merits of that side of the question on which it is employed.

It must be remembered that while there is no doubt that the evidence taken by the Royal Commission on vivisection showed that in some cases there had been gross abuses of this practice, these abuses were antecedent to the system of inspection and control which has since been established in order to prevent a repetition of them. This, however, is too often overlooked by those who are hostile to the Act as not going far enough. At a recent meeting of a Society for the Protection of Animals liable to Vivisection—at which Lord SHAFTESBURY took the chair, and there was "a large assemblage, the majority of those present being ladies"—a Resolution was passed to the effect, "That this Society, while recognizing the benefits obtained by the Act of last Session, and the humane spirit wherewith it is worked by the present HOME SECRETARY, considers that Act unsatisfactory, both as leaving room for cruelty and as dependent on the discretion of an officer of State who may at any time be changed." This is, no doubt, a legitimate opinion expressed in moderate language; but it does not appear that any proofs were given of the abuses which are supposed to require correction, or any specific proposals adduced as to what changes ought to be made, beyond a general recommendation of Mr. HOLT's Bill, which was contained in a subsequent Resolution. And, when we turn to this document, we find that it starts with the assumption, as expressed in the preamble, that "it is expedient to make more effectual provision for the prevention of cruelty to animals"; and then follow the provisions by which this is proposed to be accomplished, the Act of last year being doomed to a summary repeal, while the new method of dealing with vivisection is simply absolute prohibition.

As there seems to be a good deal of misapprehension as to the operation of the present Act, it may be worth while to state its chief provisions, as well as those of Mr. HOLT's Bill. The Act of 1876 prohibits painful experiments on animals, except subject to certain restrictions, and imposes penalties for breach of the Act. The following are the conditions on which vivisection is permitted:—(1) The experiment must be performed with a view to the advancement by new discovery of physiological knowledge, or of knowledge that will be useful for saving or prolonging life or alleviating suffering; (2) it must be performed by a person holding a license from a Secretary of State; (3) the animal must during the whole experiment be under the influence of some anæsthetic of sufficient power to prevent the animal feeling pain; (4), if any serious injury has been inflicted on the animal, it must be killed before it recovers from the anæsthetic influence; (5) experiments shall not, without special permission, be performed as an illustration of lectures in medical schools, hospitals, colleges, or elsewhere; or (6) for the purpose of attaining manual skill. Then some exceptions are enumerated; that experiments on anæsthetized animals may be performed at lectures under a certificate that they are absolutely necessary for the due instruction of the pupils in acquiring knowledge which will be useful in saving or prolonging life or alleviating suffering; or experiments may be performed without anæsthetics, or the obligation to kill the subject while under anæsthetic influence, on a certificate being given that these conditions would necessarily frustrate the object of such experiments, it being a condition that the animal, if injured, shall be killed as soon as the object of research is attained; and that experiments

may be also allowed in order to test former discoveries, if shown to be absolutely necessary for the effectual advancement of physiological knowledge. The use of curari is forbidden; painful experiments without anaesthetics are not to be performed on cats, dogs, horses, asses, or mules without a special certificate; and there is an absolute prohibition of any public exhibition of painful experiments. Official inspection of places where vivisection is performed is provided for; the Secretary of State is authorized to make any conditions on his licence which he thinks necessary, if not inconsistent with the Act; and a preliminary certificate must also be obtained by applicants for licences from various scientific authorities which are mentioned. In criminal cases the Judge is to have power to grant a licence for experiments.

It may be thought that this is a very reasonable and practical enactment, and fairly meets the necessities of the case, as far as they have been ascertained; but Mr. Holt and his friends think the law ought to be carried much further. Accordingly, the first clause of his Bill makes it an offence to "cruelly torture, or wantonly or barbarously injure, "any vertebrate animal," while the next clause prohibits all experiments causing pain or disease to animals, except for the good of the animals themselves. This amounts, of course, to what is practically the suppression of all experiments intended for human benefit; and there can be no doubt that it would excite great irritation among the medical body and strenuous opposition, so that, even if such a law were passed, it could hardly be carried out. The fact is that such a question cannot be successfully dealt with by harsh and sweeping enactments, which would stand in the way of the co-operation of the class chiefly affected. The great thing in such a case is to do as the existing Act does—that is, to promote generally a higher standard of humanity in the treatment of animals, while allowing necessary opportunities for scientific research. The main arguments in favour of Mr. Holt's Bill were that this was essentially a moral question, and that, according to some wise-acres, vivisection was of no use whatever, as every problem to which it could be applied had already been solved; and what he demanded was that the practice should be "not controlled, but wholly abolished." It is obvious, however, that a law of this kind would be quite impracticable, and conclusive testimony was given in the course of the debate as to the satisfactory working of the present system so far as it has gone. Sir H. SELWYN LEBETSON stated, from his personal knowledge of the subject, that the Act of last year had been entirely successful in effecting the purposes for which it was proposed; and he also disposed of the ignorant fallacies that the use of anaesthetics is optional, and that it cannot be known whether the law is evaded. Every precaution has been adopted with respect to licences, and any case of evasion or infringement of their conditions would soon be discovered. In point of fact, there has been only one case in which an application has been granted for permission to dispense with anaesthetics. Sir HENRY also bore witness to the readiness of physiologists to carry out the law thoroughly, not merely in its letter, but in its spirit and meaning. Under these circumstances, though it may be well that the management of the Act should be closely watched, and though on certain points it may be found possible to amend it in one way or another, prudence suggests that an experiment which has so far been satisfactory should be—for the present at any rate—let alone.

THE EARLY PAGAN ESTIMATE OF CHRISTIANITY.

AN interesting paper in the current number of the *Contemporary Review* by Professor Zeller of Berlin is devoted to the "Contest of Heathenism with Christianity as reflected in Greek and Roman Literature." Considering that the period in question includes the golden age of Roman, which is itself a borrowed reflection from the golden age of Greek literature, it may seem strange at first sight that any such "contest" should occur. For the literature of an age expresses and represents its highest civilization, and in Greece and Rome posterity has agreed to recognize the representative civilization of the ancient world. But Christianity and civilization unquestionably have much in common in their idea, their methods, and their history. Christianity, it has been justly observed, waited till the world had attained its most perfect form before it appeared, and it soon coalesced and has ever since co-operated, and often seemed identical, with the civilization which is its companion. Both alike are based on common ideas, have common views and principles, and a common standard of appeal, for the classics and the studies rising out of the classics are to the one

what Scripture and the Creeds are to the other. If Christianity has its patriarchs and apostles, Homer may be considered the patriarch, and the great Greek poets of a later age the apostles and evangelists, of the typical culture of the human race. We say Greek, for the fact, to which we have already referred, that the best Latin literature and philosophy were mainly a transcript from the Greek, seems to indicate that—according to the familiar saying of Horace—the Attic writers were destined to be, as they have in fact proved, the teachers and schoolmasters of all future generations. Civilization, to use theological language, is in the natural what Christianity is in the supernatural order, and there surely need not be, and ought not to be, any clash or "contest" between them. Nevertheless, while in the long run they have "coalesced and co-operated," their aims are not identical, and as every power has an inevitable tendency to encroach beyond its own legitimate boundaries, there have often been quarrels between the two. The almost chronic conflict of Church and State, though it involves other questions also of a purely dynastic kind, is in a wider sense part of the same great dichotomy. But the differences, whatever they be, between Christianity and culture, and between the ecclesiastical and civil order, which are constantly reappearing in various forms, have never since culminated in so violent and radical a divergence as during the first three centuries of our era, when the brilliant but deeply corrupted civilization of the mighty Empire, already sinking into premature decrepitude, was pitted against the vigorous and growing life of the nascent Church. It is to that contest, so far as it is reflected in the literature of the period, that Professor Zeller would call our attention, and there is much that is fresh and suggestive in his handling of a familiar theme.

He begins by pointing out—that what naturally follows from what has been already said—that the new religion was not without many points of contact with the mental tendencies and needs of the age. It had really in some respects more in common with Hellenic culture than with Judaism; and it certainly had much in common, in spite of important contrasts, with the Stoic philosophy, whence the story became current—for which there is no real evidence, nor even the slightest probability—that Seneca, if not secretly a Christian, was at least partly indebted to the teaching of St. Paul. It is thus the more remarkable that Christianity should have appeared to all classes of Roman society something simply and unmixedly abhorrent. "The Christians in the first place were Atheists"; and "Down with the Atheists" was the cry which rung round St. Polycarp's martyr stake at Smyrna. Being atheists, they were of course obnoxious to the charge of every form of atrocious crime, and hence the horrible and grotesque fables of their worshipping an ass's head, their Thyestean banquets, and their orgies of nameless obscenity. Even the great critical historian Tacitus thinks it perfectly natural that "a sect universally hated for their shameful deeds" should be credited, though untrue, with the burning of Rome. But to him, as to his more intellectual contemporaries generally, their original sin was not atheism but superstition, though they were not the less for that "the enemies of the human race." Atheism and fanaticism were indeed only different forms, suited to the capacity of the vulgar or the learned, of conveying the same indictment; the real offence was that Christians were monotheists. We have heard of a modern writer, whose zeal considerably outran his knowledge and his logic, beginning his attack on the doctrine of eternal punishment with a disclaimer of any desire to adjudicate between the opposite alternatives of Universalism or annihilationism, though he might have known that the rival theories are, if possible, more absolutely incompatible with each other than with the doctrine they are intended to supplant. In the same way the Romans did not seriously care to discriminate between the merits of atheism and polytheism; the latter was the established cult, the former, if we may trust Juvenal, was in his day the general belief. But whether it was more reasonable to worship many gods or to reverence none, it was equally opposed to reason and to "civism"—to adopt a later phrase—to believe in One God. It was, as Professor Zeller rightly observes, its monotheism that placed Christianity in undisguised enmity to the national religion.

But the root of this enmity lay deeper than any purely theological ideas in the national mind. We have seen that Tacitus considered the Christians a sect of loathsome and criminal fanatics, though he admits their innocence of the particular crime, of setting fire to the city, for which they were being executed. Pliny, who knew better, did not share this opinion. He had no special fault to find with the Christians, except the one unpardonable sin of resisting the State religion to which they opposed their own "strange and absurd superstition"; but for this treasonable conduct he thought they deserved death, when it was judicially brought home to them. And Trajan, whose mandate governed for a hundred and fifty years the policy of Rome in the matter, approved his view of the case. All other religions were compatible with the established worship; this one alone maintained a resolute isolation, and Christians, whatever their virtues or their vices, "could not be permitted to break the laws against making proselytes and against unauthorized societies." The way in which they held together among themselves, and their care to hold aloof, as far as possible, from the heathen world around, conveyed to an outsider, educated or uneducated, the impression of a secret society, a conspiracy against the established order of things. And that feeling was deepened among the higher classes by their well-known practice of recruiting their ranks from slaves, freedmen, and artisans, with

whom they associated on terms of equality, but whom their masters looked down upon with a contempt which is but faintly reflected in the feelings of a Southern slaveowner in former days towards his niggers. Here we touch at last upon the root of that hopeless estrangement between the Empire and the Church which, if it occasionally smouldered, broke out again and again into fierce energy during three centuries of more or less persistent persecution. A true, though at first unconscious, instinct taught the ruling classes that there was a vital antagonism between the new faith and the existing national order, which must sooner or later issue in the destruction of one or the other. And therefore a well-known remark in Dr. Arnold's *Lectures on Modern History* has always appeared to us only a half-truth, though it may seem to a casual reader to be partly endorsed by Dr. Dollinger in his *First Age of the Church*. That the Christians "were punished, not as men who might change the laws of Rome hereafter, but as men who disobeyed them now," is true of the conscious and immediate motive of the early persecutors; it is only very partially true of the later and more intelligent representatives of the same policy. Dr. Dollinger says, with his usual accuracy, that "the authorities and philosophers did not for some time understand clearly how completely the Christian Church was the rival of the Roman State, or they would not only have persecuted by fits and starts"; but the very form of expression implies that they began to discern this afterwards. And so only can we account for the startling fact, to which Professor Zeller refers, that Marcus Aurelius, the best of the Emperors and one whose character and belief had much of moral and even religious affinity to Christianity, was the severest of persecutors, and denounced the constancy of the Christian martyrs as proceeding from "more defiance."

If we come to later Roman writers, we find the sceptical and worldly Lucian content to sneer at the foolish and fanciful fanaticism of the Christian sect. His Platonist friend Celsus takes a much more serious view of the matter, and charges them and their Founder with deliberate imposture; but the head and front of their offending is still, as in the days of Tacitus—though it is expressed in less vehement language—their exclusiveness, their want of patriotism. Originally apostates from the national faith of Judaism, they were accused of remaining indifferent or hostile to the welfare of the Roman State. After the middle of the third century the antagonism to the new faith took a somewhat different form with the rise of the Neoplatonic philosophy. Philostratus and Porphyry and Hierocles display more of the critical and carping tone of modern sceptical writers, and are obliged to admit a good deal of truth in the system they assail. The brief and highly artificial attempt of Julian to galvanize the moribund Paganism into a new life was in fact based on an elaborate plagiarism from the despised "Galilean" superstition which he both hated and feared, and even had his reign not been prematurely cut short, was doomed from the nature of the case to inevitable failure. When St. Cyril wrote his ten books against Julian the last hope of Paganism had sunk into the grave with him, and thenceforth even literary attacks on Christianity gradually diminished. It is quite true, as Professor Zeller points out, that the heathen polemics have been revived by many recent assailants of the Gospel, but that is too wide a subject to enter upon here.

DIFFICULTIES OF THE NOVELIST.

THOUGH a large proportion of men, women, and children write novels, it is still the fact that clever people very seldom attempt to compose, and still more rarely venture to publish, works of fiction. If any one looks round on his acquaintances, it is not among the witty, the brilliant, or the adventurous, who have stories of their own, that he finds the novelists. People who seem to possess all the qualities that make the successful romancer do not, in point of fact, write romances. They have style very probably; and, on all things, an easy and accurate style is the rarest in the modern novel. They have humour, they have knowledge of the world; and, while they hold their peace, dullards who know far less of life and character make the gains and enjoy what reputation a third-rate novelist can acquire. Again, there are people who, in addition to the excellent qualities of which we have drawn up a catalogue, possess useful reminiscences, and are even anxious to express, under the veil of fiction, their ideas about men and women. But they do not write novels for all that. They leave the field untilled; they let the prizes be won by the "forth-right craftsman's hand" of a professional novel-wright, or let the fame go to some girl who has no qualifications except the memory of an unsuccessful flirtation. If cultivated persons of the sort we have in our minds have sought expression in their lives, the expression has taken the unromantic and unpopular shape of verse. Now a novel is really a much better vehicle than verse can be for our modern emotions; it expresses more clearly the mixture of regret and amusement with which we look back on our own failures and follies that were so overwhelming and so insignificant, so commonplace and so all-important. The half-real men and women of fiction would be far better mouthpieces of all the thoughts that seek to utter themselves in literature than are sonnets or ballads, however wonderfully woven. And a novel could hardly fail to pay its expenses in one way or another; whereas, from a purely commercial point of view, English verse is an unconsidered drug in a glutted market. In spite of these obvious facts, the English novel is for the most part left to people

whose ignorance of life and even of grammar is as remarkable as their audacity.

Andacity, a blind ignorance of difficulties and risks, is really the saving characteristic of ordinary novelists. As Turner said of amateurs in another art, "They don't know how difficult it is," and their ignorance is their salvation. They do not know what has been said before by others, and have no idea that they are not original. They have no sort of shyness in working the ancient machinery of intercepted letters and concealed wills, and in assuming tacitly that, just in the very *modus* of the tale, the characters were affected with momentary idiocy. People of more taste and knowledge see all these coarse devices, and, if they wrote a novel, would of course avoid them. But when they come to try, then they are more than ever aware of the difficulties, and they realize the limitations of human fancy. The collectors of nursery tales have discovered that, from Japan to the Ionian Islands and from Natal to the Hebrides, there are only a certain number of plots in these efforts of imagination. They have drawn various conclusions from this fact; but the most obvious conclusion is this—that, complicated and various as human relations are, there exist limits to the imaginative power of arranging them in fiction. Without going so far as comparative mythology, the fastidious person, the *raffiné* who would like to pour out his thick-coming fancies in a novel, finds himself checked by the limits of imagination. He fondles the sketch of a plot in his mind, till one day the truth flashes on him that his plot is very like one of Mrs. Henry Wood's or of Miss Annie Thomas's. There is no profit in pursuing the attempt any further, and no pleasure in treading a path where there are the *priorum vestigia*, the marks of countless wayfarers. But the difficulty of avoiding a well-worn plot and familiar incidents is only one of the thronging troubles which frighten away the would-be novelist who knows too much. He has a keen sense of absurdity, and in a novel it is next to impossible to avoid the absurd. Hawthorne found the excellence of this sort of writing to lie in the constant skirting of the precipice of nonsense and of the impossible without actual disaster. That an author of so shy and sensitive a genius as Hawthorne could publish his own attempts to evade the inevitable is of course encouraging. But the men and women whose friends are always telling them to write a novel never escape the sense of looking at the precipice in cold blood. They are too critical of themselves to get into that heat and fever of composition in which one scarcely sees, and does not heed, the neighbouring abyss and the risk of descent into bathos. Experience of life has shown them that in life novels, so to speak, do not develop themselves. A romance begins in a man's or a woman's history, and goes as far as the middle of the second volume, when facts get in the way and bar it. Life in this respect is really like a dream; for affairs move in an interesting and exciting manner so far, and then a slight unnoticed diversion stops the movement, and sends it in another direction, to no catastrophe, to no *dénouement*, but only further into the dullness and calm of commonplace. As in a dream, people lose the thread of the plot, scenes shift, characters disappear, and, as the Sagas say, "are out of the story." Now the art of the novelist is obliged to counteract these tendencies of actual existence; to fit things in where in life there would have been a break; to keep people together who in life would have drifted apart; in fact, to round all within a magical circle. The popular demand insists on all this, though, if novels were to be true to nature, they would generally be fragments of the great procession, and would come to no definite end. The general taste calls for a less epic treatment, and will have it that our little lives are rounded with a wedding, or, in a few rare cases, readers will put up grudgingly with a story which "ends badly." Probably the majority of writers share the tastes of their readers, and of course the workman must work to order. But the difficulty of exhibiting an honest picture of life, tinged with some colour of sentiment, touched with some pity for human incompleteness, is immensely increased by the need of satisfying the popular demand. How many modern novels are works of art, unstained by claptrap? how many are true expressions of the truth about love, marriage, death, regret for lost affections, and for vanished time? In place of these things the novel-writer puts his hand into a kind of lottery, and brings out two sets of flirtations, a rich old man's will, a runaway horse, a mad bull, a sprained ankle, a stolen letter, and some sketchy illustrations of the foibles of the day. These things are his materials, and he is allowed to make the best picture he can out of them. Of the real stuff of existence he must take sparingly, and what he does take he cannot leave in its incomplete, fragmentary state—a *statue à la Pygmalion* of what life should be, and of its failure. He must glorify his young man and woman in bridal raiment, or he must have tombs and funerals; he is not allowed to paint simply one of the dreams within this dream of existence, which blend we know not how, and pass into other and duller experience, leaving only a memory.

It is extremely probable that, if novels were written in the manner we have indicated, they would be remarkably vaporous and dull. We do not want to be reminded of our incompleteness. Mr. Johnny James, when Miss Lily Dale told him that she was only a fragment, said, "Well, be my fragment." But the artistic sense which is content with fragments, and prefers a broken head from the Parthenon to the groups round the Albert Memorial, is unusual. Though the artistic scheme of our lives and adventures is not visible, though only a hint here and there can be detected, the public likes novels to display a nice, smooth, and coloured consistency. That all the honest and pure maidens should marry dukes, all the villains be bitten by mad dogs, and all the bad preachers be

crushed by the fall of the sound-boards of their pulpits, is no longer rigorously required. But an approach to this harmonious completeness is necessary. It is necessary that things should go on happening, though things really do not happen much in actual experience; it is needful that people should have emotions, eloquence, plenty to say. Thus some novels obviously contain all the good things that the author has thought or heard, and garnered into his commonplace book, for years. The writer, having to make a cake, is determined that there shall be plums in it. One amusing novelist, whom we mention with gratitude, is so conscientious about giving full measure of plums that he not only makes all his characters witty, and will not deny even his scoundrels their joke, but also causes them all to run the gauntlet of unheard-of perils. The result is an extreme richness; but how clear it is that the art of novel-writing is neglected or even debased. Perhaps the conclusion should be that novel-writing is not really an art at all, but a branch of manufacture. A good many signs, and chiefly the regularity and rapidity of production, strengthen this opinion. When we can get a glimpse of a great writer's own notions about the profession, we find Thackeray complaining of the immense fatigue and annoyance of "the business." Why should not the novelist have some intelligent young man, he asked, to look out Lambeth in the *Encyclopædia*, to describe the death of the Archbishop, and the stolen interview of the Archbishop's daughter with her lover in his boat? To find a will in an old coach, or in a page of a long-unopened book, was obviously vexatious to the author of *The Venetians*; but, without some such inartistic device, *The Venetians* could not have ended in a satisfactory way—must have remained, as we have said that in life novels do remain, a fragment. People without much delicacy of taste do not feel these objections, and are unaware of these difficulties. They do "the business" without an effort, and round everything off with a happy sense of complacency. They are never stopped by the sudden sense that what they are writing is more or less absurd, that it is only by a stretch of the laws of the game that characters can be supposed to behave in this way or that. No doubt there is this excuse for the novelist—that his craft descends from romance, from a time of childlike readiness to swallow fabulous wonders. When we take up a novel, if we would be just, we should assume something of the child. We should be ready to believe in opportune chances, and lucky discoveries, and terrible villains, and in the possibility of "living happy ever afterwards." We should say to ourselves that all this happened "once upon a time," in spite of the abundant local colour and allusions to details of manners on which the writer insists. Perhaps the deeper and more true a man's sense of the humour and pathos of life is, the more difficult it is for him to take the excuse of the novelist. Thus novel-writing, on the whole, is left to the ignorant and audacious; "these we give our duty, dreadful line," as reviewers might parody a verse of Mr. Browning's.

THE FAMINE IN MADRAS.

THE latest reports from India make it abundantly clear that the policy vaguely indicated in Sir Richard Temple's original instructions is being carried out by that energetic official with characteristic zeal and thoroughness. It was, it will be remembered, a policy of reaction from the too generous profusion with which relief was administered in the last Bengal famine. Though the general duty of saving human life was not actually discarded, it was stated in terms far less absolute and peremptory than it had on previous occasions been usual to employ. "Even for an object of such paramount importance as the preservation of human life, it is obvious that there are limits imposed on us by the nature of the facts with which we have to deal." The principle thus enunciated gave rise to sarcastic objections on the part of one of the subordinate Governments whose task it was to carry out the new régime, and the Government of India was obliged to explain that all that was meant was that the utmost possible economy must be observed. The rule was still laid down that "human life shall be saved at any cost and at any effort." Sir R. Temple's mission appears to have been to strike a judicious mean between generosity and prudence, and the enormous proportions which the calamity has now assumed show the vital necessity of such a mean being struck. Madras has, according to Lord Carnarvon's despatch of January 12, an area of distress amounting in the aggregate to some 80,000 square miles and a famine-stricken population of 18,000,000; in the Bombay Presidency there is a famine area of 54,000 square miles and 5,000,000 of people immediately affected by the dearth. Madras had, at the date of Lord Carnarvon's letter, 840,000 men employed on relief works; 250,000 were similarly employed in Bombay; these numbers would, it was estimated, in the latter Presidency rise as high as a million in April, and a corresponding increase would have to be looked for in Madras, April and May being the months during which the distress might be expected to be most acute. Recent events have not tended in any way to lessen the gravity of the evil which these figures imply. The rainfall in the Madras Presidency for the first three months of the year, though above the average of the corresponding period of the three preceding years, has not been sufficient to give more than partial and temporary relief. It was not, it appears, enough for the purposes of rice cultivation; but it served to arrest the destruction of cattle, and even to admit of some of the less important crops being planted. The

general famine area must be considered as in no degree substantially diminished, while every week of course lessens the capacity of the population to bear up under its prolonged affliction, and aggravates the intensity of the terrible cohort of malads that follow in a famine's wake.

It was in a high degree improbable that a mission so delicate, and in some ways so painful, as Sir Richard Temple's, could be performed without giving rise to the animosities which divergent opinions on matters of practical administration so easily provoke. His appointment as representative of the views of the Supreme Government, though veiled in language of decent politeness, was easily interpreted as a slight upon the subordinate Presidencies. It was unfortunate too that the friction naturally occasioned by the interposition of a novel authority should have been intensified by a conflict of views between the Supreme Government and that of Madras, as to the initiatory step taken by the latter to meet the approaching crisis. The experience gained in the famine of 1873-4 had been formulated by Lord Northbrook in an important Memorandum, which laid down rules as to the occasions on which the State might advantageously interfere with the ordinary operations of trade in times of dearth. One of these rules limited the action of Government in supplementing the ordinary food supply to occasions "when there is a great deficiency, and there is also reason to believe that traders will be unable to meet that deficiency." On the failure of the North-Eastern monsoon last autumn the Madras Government considered that such an occasion had arisen. The crops were known to be lost, prices had suddenly reached famine rates, the available store of grain was ascertained to be wholly insufficient, there was a manifest determination on the part of the merchants and dealers not to part with an article which might become indefinitely valuable; the operations of the trade were confined to bringing large quantities of grain from the outlying districts to a few central depots, while retail trade was at a standstill; "grain riots by hungry mobs of men, women, and children, and more serious disorders, accompanied by violence, followed in many parts of the country, and elsewhere outbreaks occurred in the hope of checking exportation, and thus preventing dreaded scarcity. . . . The Government found themselves suddenly confronted with this position—that a large proportion of the labouring population of a wide tract of country had become at once dependent on State relief works for the means of earning their daily bread, but that that food was not obtainable with whatever money they could earn." In this emergency the Madras Government resolved to follow the precedent of Lord Northbrook's policy in Bengal, and to buy by private agencies some 300,000*l.* worth of food by way of a reserve. It is a matter of regret that this important step should have been taken without previous concert with the Government of India; but assuming, as the Madras Government apparently thinks, that there was no time for discussion, there has been much to show subsequently that the step was a wise one. However that may be, one practical result of it has been to commit the subordinate Government to the defence of a course of action which the supreme Government, and ultimately the Secretary of State, have disapproved.

Nor have the subsequent dealings of Sir Richard Temple with the famine operations been of a nature to allay the irritation incidental to his appointment. Alarmed at the vastness of the evil with which he found himself confronted, he appears to have set about reducing its proportions with a degree of summary resolution in which the Madras Government finds it difficult to follow him. Two obvious modes of economizing suggested themselves—one to turn away from the public relief works all who could by any possibility procure any sort of subsistence elsewhere, or who would not submit to severe and alarming tests; the other to reduce the pay to a minimum at which no one responsible for human life had ever ventured to say that health could be maintained. There was nothing to hinder the application of these experiments except the probable mortality involved, and Sir R. Temple appears to have considered that this risk ought to be run. Both were accordingly unflinchingly enforced. In three of the most afflicted districts the numbers on relief works were reduced from 950,000 early in January to 493,000 in March; in other words, nearly half a million of human beings, ostensibly in necessity, were turned adrift in a season of dire distress in a country as devoid of all means of livelihood as the Great Desert. Sir R. Temple writes of this reduction with a complacency which he alone of the officials concerned appears to feel. "The numbers are reduced in a manner," he says, "partly in some degree, though far from exactly, proportionate to the dimensions of actual distress; so far the Madras Government may be congratulated on the result." To this it is with great reason replied that congratulations are premature till we know what has become of the half-million unfortunately to whom State aid was thus suddenly and peremptorily refused. The statistics given by the Madras Correspondent of the *Times*, in his letter of April 7th, point to the horrible possibility that a large proportion of them may have perished. The average mortality of six districts is shown to have more than doubled in every instance, and in one case (Kurnool) to have increased sixfold. This is a state of things which implies that the benevolent task of saving life "at any cost and at any effort" has been but very partially fulfilled. The same Correspondent gives details of the Cuddapah district, which are extremely significant. At one place 40,000 persons were early in the year receiving aid at the public works; this number has now been reduced by Sir R. Temple's stringent measures to 8,000. Allowing a wide margin for fraud, this reduction leaves a serious number to be accounted for. "If

is only right," says the Correspondent, "that I should state one cause of decrease. There has been already a very terrible mortality among the labouring poor of this subdivision. Mr. Gribble tells me that the result of his inquiries in certain villages went to show that about 15,000 out of a population of 35,000 had died in the month of January from a form of cholera which may be termed 'famine cholera.' I know, on the authority of a district officer, that in the course of a morning he came upon eight human bodies unburied, partly eaten by dogs and jackals, 39 dead bullocks, &c., &c. The mortality in this part of the country has been something awful; and, although cholera is on the wane, the people who come into the camps to be fed are in so feeble a state that experienced medical men think it hardly possible that one half of them will survive."

When reports such as these are given by local officials, it is not to be wondered at that there should be a strong feeling among officials at Madras and in the local press of discontent with the proceedings of the delegate from the Supreme Government. The Sanitary Commissioner has expressed, in terms of the utmost explicitness, his conviction that the scale of diet enforced by Sir R. Temple is incompatible with the preservation of health; and we regret to learn that by the last mail intelligence has been received of the appearance of exactly the class of diseases which the Sanitary Commissioner predicted as the inevitable consequence of an inadequate dietary. The mortality in the relief camps has been at the rate of 930 per mille per annum; in other words, the wretched victims had, in all cases but an insignificant fraction, been reduced so low that nothing could save them. Sir R. Temple appears to be still unconvinced, and in the meantime all that can be said is that the experiment which he has so courageously enforced is an extremely costly one, so far as human life and suffering are concerned.

The Madras Government naturally watch its progress with extreme anxiety, and we observe that even Sir R. Temple has, on its representations, consented to some partial alleviations. There has been, however, an appalling loss of life; and before we can judge how far Sir R. Temple deserves the praises of his friends or the execrations of his numerous enemies, we must know the real extent of this mortality, and the degree in which it is attributable to the severity of the tests under which aid has been given. As things now stand, Sir R. Temple's experiments cannot be said even approximately to have succeeded. The problem proposed in an Indian famine is, not to give as little aid as possible but to save human life by every reasonably available expedient. When we hear of a death-rate at six times its normal height, of villages where nearly half the population dies in a month of what is politely termed "famine cholera," of relief camps where only a tiny fraction of the inmates can be rescued from the prostration of prolonged misery, we are forced to the disconcerting conclusion that the problem is not being solved at all so far as these poor wretches are concerned. Lord Salisbury is no doubt fully alive to the gravity of the crisis, and to the incalculable misery which the rashness of an over-hasty official might at such a conjuncture inflict on many millions of British subjects; and, in the interest of future sufferers, it is to be hoped that the Government will spare no pains in ascertaining the extent of the present mortality, and, if necessary, will not hesitate to reverse the policy of which it is the result.

SQUATTERS.

THERE is a steady and systematic development of population in every age of an inhabited land; swarm succeeds swarm of settlers, each either superseding or intermixing with that which preceded it. Not only in what are technically termed "clearings," and on what the dictionaries call "new ground," does this rule hold good; but also in the most venerable of fatherlands. And thus we find in our own time-honoured country, as well as in the backwoods of America, many representatives of that pioneer of colonization vulgarly known as the "squatter." The most rabid of radicals could hardly wish for a more effectual deranger of local customs and prices than the civilized member of this class, albeit he is very frequently a most orthodox conservative. Like wolves on a prairie, or rats in a sewer, squatters, though powerless and unimportant individually, are dangerous when encountered in large numbers; and we may almost go so far as to say that they are ever effecting social revolutions. It is popularly supposed that country society consists of hereditary landed proprietors living on their estates; but, were this the case, the list of neighbours would in these days be reduced in most districts to a minimum. Many people may be inclined to combat this statement; but, let them fairly count over those in their own immediate neighbourhoods whom they invite to their houses, and we suspect that they will find several who are not hereditary landed proprietors but have deliberately "squatted" in that particular part of the country. There are many varieties of this species. Some have chosen their habitat for purposes of sport, others in order to be near some influential friend or relative. Married eldest sons whose fathers are still living, and unmarried ladies whose parents are dead, are to be found among their ranks, as are retired officers, widows, bearers of courtesy titles, and owners of properties in undesirable and scarcely habitable regions. In fact, their name is legion; they range from the retired tradesman to the Irish absentee noble. Their habitations are as various as their

origins. Generally speaking, when *nouveaux riches*, they prefer old houses. Next to being of old families themselves, they seem to esteem living in old family houses. A fine half-timbered Elizabethan mansion is that which the soul of the manufacturer longs for, unless he cares more for the locality than for the dwelling which he is to inhabit, in which case he will buy up odd fields about the wished-for resting place, and then build what he calls a "hall" in their midst. Country places of all sorts and shapes are eagerly rented by squatters, except very large houses, which are usually difficult to let, since those who could afford to live in them could also afford to buy properties. A great many comfortable but moderate-sized houses were built about the reign of Queen Anne, or at any rate during that elastic period which is conventionally accredited with her name. These, whenever procurable, form the favourite homes of squatters, especially the small houses of this type, so many of which were built in the eighteenth century by men who had made comfortable but moderate fortunes in India. Old manor-houses, granges, and even enlarged farmhouses, are also their special resorts. Their haunts are likewise to be found among those large, mysterious-looking red brick houses which often stand at the entrances to small country towns, and which offer peculiar advantages and conveniences to men of small means, though they are often objected to lest their proximity to the innocent little townlet should betoken an intimacy of their tenants with the doctor and attorney, of whose society the squatter has frequently a superstitious horror. Perhaps the true habitat of the genus is the indescribable little white house with laurels round it, of which so many are to be found in these days. These are often cots with the conveniences of large houses, even billiard-rooms being sometimes attached to them. There is only one feature which is common to the dwellings of nearly all these well-to-do little settlers, and that is an Alderney cow which feeds in the adjoining paddock; indeed one of the special characteristics of the squatter may be said to be that he is an "Alderney-cow-keeping animal." Although not a universal trait of this class of people, a very usual one is the keeping and breeding of prize poultry, pigs, or dogs. They are also much addicted to making collections, and they usually possess some excellent bits of old china; in fact, they give prices for bric-a-brac which would make the hairs of the surrounding squires stand on end.

The new comer is often an object of interest in an out-of-the-way place. The great natives begin by looking contemptuously at him, much after the manner of huge dogs when a strange toy-terrier is introduced into their kennel; but after a time they sniff at him, or perhaps give a growl or two, when presently one big dog's tail begins to wag a little, just at the tip, and then that of another, until they at last get playing with him, after which the popularity of the little dog depends upon his own disposition and capabilities. The educated, amiable, and agreeable squatter is sometimes the means of infusing fresh vitality into a neighbourhood in which that commodity is sorely needed, and this is especially the case when he only spends part of the year at his rural retreat. He is, under such circumstances, a far greater acquisition at a country dinner-party than a curate or a young squire. His position has also this advantage, that it does not entail upon him partisanship in local squabbles. Too frequently the squatter voluntarily enters into them, and perhaps, when he spends his whole time in the country, to avoid doing so might be difficult; but where he is only an occasional resident, it is at any rate unnecessary. He ought to value his neutrality very highly, because it may enable him to be the medium through whom families hitherto at enmity may meet and be friends. If he directly meddles in other people's quarrels, social ruin awaits him; but it is within his power to be a passive agent through whom feuds may be made up. Although he is not called upon to exercise the usual functions of a country gentleman, there are many opportunities of usefulness open to him. It may not always be either convenient or desirable to make him a magistrate, but Boards of Guardians, road meetings, vestries, savings banks, and churchwardships offer plenty of scope for his assiduity. He may have no cover for the hounds to draw, but his subscription to the hunt or poultry fund, although not large, is extremely welcome; and he may have no pheasants to offer in sacrifice to his neighbours, but the gun which he holds so straight may be very serviceable on the day of a grand battue, when one of the best shots has failed at the last moment.

We wish we could hold up the squatter to unreserved eulogy. This, however, we cannot do. Generally speaking, solitary specimens of this division of humanity are vastly preferable to a larger number, and we trust we are not speaking uncharitably when we give it as our opinion that, if agreeable in units, and bearable in small detachments, they are simply unendurable in the herd. It not unfrequently happens that they are of an unenterprising disposition, and although, as we have already observed, there are many opportunities of usefulness open to them, they are under no compulsion to work or play, like other country gentlemen, and there is no special exception made in their case as regards that "mischief still" which is provided for the employment of idle hands. Hence they and their womankind (especially the latter) are apt to lapse into mere mediums of petty gossip, whose sole occupation consists in collecting local tittle-tattle. Now the retailing of this valuable merchandise is likely enough to be repaid by a certain amount of popularity for a short period, as it amuses people to hear their dear friends abused; but "murder will out," and as each listener finds out indirectly that her own alleged misdoings

have been expatiated upon by the oracle, the gossipmonger loses a friend and makes a bitter enemy. Having nothing particular to do, squatters are sometimes addicted to "looking in" at odd times at their neighbours' houses. To prosaic country people the novelty of visitors coming to see them in an informal manner at unconventional hours has at first a certain charm about it, especially as it may be taken as a personal compliment; but the enchantment is soon dispelled, and that which was regarded as a pleasure becomes an insufferable nuisance. Moreover, not only socially but financially does squatting occasionally prove odious. It generally has the effect of sending up the price of manual labour in the immediate locality, more especially garden and stable labour. On his arrival at his new home, the incomer is ignorant of the current standard of wages, and gives but a trifle less than the men demand. This is usually two or three shillings a week more than his neighbours have been accustomed to pay; and yet, having once begun by giving so much, he cannot well give less afterwards. He is quoted by other people's outdoor servants to their masters as a specimen of what they are pleased to term a "real gentleman." Now one of these "real gentlemen" is a social nuisance, but a colony of them is as bad as a gang of brigands; and their presence is apt to engender evil and unchristianlike feelings in the human breast against the whole army of squatters, people in neutral positions, cottages with double coachhouses, and real gentlemen. To this fiscal confusion is frequently added the embarrassment caused by their indiscriminate charities. The unwise scattering of a handful of silver coins in cottages within half a mile of the settler's house throws into odious insignificance the judicious labours of the squire and his family among the poor for a mile round. Squatters are, as a class, popular with the clergy, partly perhaps on account of their readiness to support fancy charities. They will subscribe to the Church Association, the Liberation Society, or the Fund for the Relief of Distressed Chimney-sweeps, from which benevolent objects the squire would shrink. If the latter subscribes to a charity, it is considered to be only a fulfilment of his duty; but when the former give their mite, it is regarded as a work of supererogation. They have few of those calls upon their purses to which the landed gentry are so much exposed, and from these and other causes they are oftener richer on incomes of three thousand a year than are the surrounding landowners on rent rolls of double that amount.

The squatter's status is by no means invariably a satisfactory one to himself. Unless he is of a very enterprising disposition and full of resources, he has few objects, few duties, few occupations. When he has persuaded friends to come and stay with him at his charming villa, he discovers the appalling truth that he has no means of amusing them. He may cater for them better than would a neighbouring duke; but what is he to do with them between the hours of meals? Walks along high roads are apt to become monotonous, and objectless drives soon begin to pull upon the most enduring of guests. Another difficulty presents itself in the absence of means at his disposal for repaying the hospitalities of the squires who have been kind to him; and he even finds it hard to converse with them, as he and they have but few interests in common. He sometimes feels all these things deeply, and is painfully conscious that he is a social anomaly, while this very consciousness causes him to be diffident and awkward in society. As a last resource, and rather from want of occupation than love of art, he occasionally takes up painting, playing some musical instrument, singing, wood-carving, or gardening; and it is well that he should do so, for otherwise he might, like one of his own roses if unpruned, pass into the original briar and become a brainless boor. The daily increase of squatting and squatters, although it may be disturbing the even tenor of rural life in England, is a truly British phenomenon. On the Continent the stream of population naturally flows from the country to the towns, whereas here the current runs in the opposite direction, thanks to that love of the country which, one is of course proud to believe, is indigenous to the breast of every Englishman; and even if, like other people, he may have his failings, we cannot help favourably comparing the squatter who, from a genuine love of green fields, leaves the town where he is known to settle in the country where he is unknown, with certain owners of large country houses who all but desert their beautiful homes for London and Continental cities.

MADAME DE SÉVIGNÉ.

AS far as mere fame goes, we do not know that the genius of a woman has anything to hope for that shall equal the glorification which her countrymen lavish on Mme. de Sévigné. Will the *chefs-d'œuvre* of George Sand or George Eliot be hereafter celebrated with the honours that have been showered for two hundred years on the flowing pen of the first of letter-writers? Will the Fellows of the Institutes of 2077 be collating their manuscripts, comparing editions, diving into obscurities, annotating, dating, detecting interpolations, treating them as authorities on the niceties and graces of language? Will their works be put foremost among the classical works of their respective countries? We cannot suppose it. They are too masculine in their powers; their genius, like their *noms de plume*, aims at too close a fellowship with man's genius for any such homage. For the fame of Mme. de Sévigné is homage. It is her never absent womanhood that makes her what she is as an author. That in-

timate companionship to which her brilliant style admits us with what is most charming and enlivening in feminine society prompts to praise as an act of gallantry. It is companionship with a woman gifted with all the charms and graces of her sex, who sees everything with a woman's eyes, who never dreams of woman's rights or wrongs, who has no ideas on woman's mission, who treats what are called frivolities as serious things, who acquiesces blindly in the fact of man's supremacy—all the while thinking her own thoughts, clear in her own opinions, and taking her own way. We see her wise, practical, and vigorous, loving, tender, and constant, cheerful and playful, all in woman's fashion; her pretty head never too heavily weighted with thought for her graceful shoulders. It is this essentially feminine quality that delights the editor of the newly-discovered fruits of her prolific pen. It is because she was not a Pascal that he has found that "le génie plein de grâce de Marie de Rabutin ne méritait pas moins de zèle que l'austère génie de l'auteur des *Pensées*."

It certainly does imply genius of a high order in its own line that letters which were written at full speed, "écrites d'un trait," "à course de plume," written "avec tant d'art et si peu de peine," two centuries ago, should still, as they were composed "sans modèle," remain "sans rivale." Perhaps we see realized in Mme. de Sévigné the perfect conditions for giving play to her genius, conditions without which no genius can do itself justice. Nobody could write such letters now, because, among minor causes, nobody can be so free-spoken. Her whole being went out towards expression, and recognized no checks; while her mind found its satisfaction in things that could be described and expressed. All the affections and interests, the dignities and the homeliness, of social life were her subjects; and perhaps in no other society were these last two ever brought into such close juxtaposition; her rank and high position elevating her natural courage, and inspiring an easy confidence that what she thought fit to say was a thing to be said. Surely no woman had ever fewer reserves or a more comprehensive candour. To her daughter she lays bare every thought of her mind, every feeling of her heart, every incident of her life—everything, in fact, but certain misgivings concerning her daughter's temper and disposition, which perhaps never found in her innermost convictions a more definite wording than in the hints and ingenious turns through which we form our judgment. In this exceptional instance of gentle indirectness we detect the timidity and self-mistrust of an engrossing affection, and learn to believe in her maternal devotion as a true absorbing passion. This power of saying everything that crossed her mind, joined with an intense interest in all that concerned her daughter, naturally led to a frankness of utterance that called for reserve somewhere. The letters were inimitable letters, and her daughter knew their value and kept them; but we are not surprised that it was almost exclusively through copies that they were committed to the hands of the printer. Nor, again, is it surprising that even a first copy needed a second revision. M. Capmas is to be congratulated on his discovery of the original copy; but we sympathize in the reticence which led Mme. de Grignan or her daughter to reserve for family reading, not only family weaknesses, errors, and humiliations, but the solicitude which finds religious expression in such adjurations as "Au nom de Dieu parlez-moi de vos coliques!"

Her maternal anxiety has a hundred moods, all the more real from the evident misgiving as to how her daughter may take them. There is the very poetry of daring in the following impatience of absence and longing for reunion, where she throws the days at the head of those who want them, and even sleeps in a hurry:—

Pour cette joie de voir passer les jours les uns après les autres, je la sens en moi, et j'y fais réflexion à toute heure. Quand vous êtes ici il n'y en a pas un que je ne regrette; je trouve qu'ils m'échappent avec une vitesse qui m'attriste; une heure, un jour, une semaine, un mois, un an, tout cela court et s'enfuit avec une rapidité qui m'attriste toujours, je dis même au travers des peines et des inquiétudes que me donne toujours votre mal. Présentement, ma bonne, que je ne respire que de vous revoir, et vous pouvoir garder et conserver moi-même, je voudrais que tout cet intervalle fût passé; je jette les jours à la tête de qui les veut, je les remercie d'être passés. Le printemps et l'été encore me paraissent des siècles; il me semble que j'en verrai jamais la fin. Je dors vite, et j'ai de l'impatience d'être toujours à demain, et puis de recevoir vos lettres, et puis d'en recevoir encore, et encore d'autres. Je me garde bien de faire ces confidences, on ne les comprendrait pas; mais quelquefois entre mille autres choses il faut que je vous conte tout cela.

The object is different; but this is the ardour which made her grandmother, Jeanne de Chantal, a saint. Mme. de Sévigné's excessive sensibility on this score was no doubt a trial to her friends, who even ventured to point out to her that she and her daughter worried one another when together; a lecture which her sense and amiability took in good part, saying, as she repeats it: "Faisons donc mieux, ma bonne, une autre fois; remettons-nous en bonne réputation; faisons voir que nous sommes assez raisonnables pour vivre ensemble." She had high ideas of friendship and its claims, which in different forms she is constantly laying before her daughter. She had even faith in explanations, which shows a temper formed for intimacy:—"C'est souvent faute de se parler et de s'expliquer que les choses s'aggravent, les cœurs se resserrant chacun de leur côté." Her friends were devoted to her, and her modesty shows itself in the diffidence of her tone in recognizing their devotion, and its claim upon her confidence:—

Je sais bien qu'on ne meurt point de l'absence de ses amis; on en sent d'autres qui sont encore plus sensibles; mais il est certain que toute la vérité et toute la sincérité qui peut être entre des amis elles se trouvent entre ces personnes-là et moi. Leur amitié ne me fait pas changer d'avis, mais je veux avoir un procédé honnête avec elles et sincère.

But on all these points the readers of Mme. Sévigné's letters can learn nothing new from these volumes; which, on their part, mix so generally the *inédit* with that which has already been printed that it is not easy to disentangle the new from the old. For example, are our readers acquainted with the following reflections upon plain women, *à propos* of a crying example of extravagance, which follow some incense offered to her daughter on being gifted with sense as well as beauty? All beautiful women, however, are not clever, and the world excuses their folly, "en faveur de leur beauté et du bruit de leur jeunesse et du grand monde":—

Mais de voir une laide bête, à qui on laisse tout le loisir possible de travailler aux affaires de sa maison, et de se rendre complètement cet endroit, négliger cette occasion d'être bonne à quel que chose, et de se faire pardonner tous ses désagréments, qui n'y pense seulement pas, qui s'amuse à discourir de toutes choses hors de ce qui la devrait uniquement occuper, et qui se trouve toute rancée, toute abîmée, toute accablée, au milieu des plus grands revenus qu'on puisse avoir, moi chère femme, je vous avoue que cela me met en fureur, et que je voudrais qu'il y eût une punition pour celles qui font un si mauvais usage de leur esprit et de leur laideur, qui serait bonne au moins à quelque chose, si elle établissait une maison.

Here is an anecdote of convent life and discipline, which we give as an example of easy dramatic narrative, and of not ill-natured satire on the high-born Abbess:—

Le pauvre Anouin [a fashionable physician] n'est plus à Chelles; il a fallu voler au visiteur. Madame est inconsolable de cet accident, et pour se venger elle a défendu toutes les entrées de sa maison, de sorte que ma sœur de Birou, mesdemoiselle de Birou, mesdemoiselle de Molléville, ma belle-sœur de Cossy, tous les amis, tous les cousins, tous les voisins, tout est chassé. Tous les parloirs sont fermés; tous les jours mal je suis obligée; toutes les matines sont chantées sans miséricorde; mille petits relâchements ont réformés; et quand on se plaint, "Hélas! je fais observer la règle." Mais vous n'êtes pas si sévère. C'est que j'avais tort, je m'en repens." Enfin on peut dire qu'Anouin a mis la réforme à Chelles.

In fact, Mme. de Sévigné's religion is not of the severe order. Whatever else she may have inherited, asceticism is not congenial to her temper. She obeys her Church; but her amusements are never more remarkable than in the little notices of her prayers, her observances, her pleasure at returning to "colletes et petits poulets"; and her recoil from the Trappist dinner, "Ce que vous me dépeignez est horrible; je ne comprends pas cette sorte de mortification," contrasts markedly with her supper of nine at the Abbé Pelletier's, at which, not for the table, but for those who sat round it, we should all probably have been very willing guests. Nobody had dined, so people ate with a good conscience:—

Personne n'avait diné; nous dévorions tous. C'étoit le plus beau repas de Carême qu'il est possible de voir; les plus beaux poissons les mieux apprêtés, les meilleurs ragoûts, le meilleur cuisinier. Jamais un souper n'a été si solidement bon.

But she can be equally eloquent on a piece of bread and butter; on which she and her son descend—he dwelling on the thinness of the bread and thickness of the butter, she finding natural satisfaction in a fact which that unusual test brings to light:—

J'aime le beurre charmant de la Prévôté, dont il nous vient toutes les semaines; je l'aime et je le mange comme si j'étais Bretonne; nous faisons des beurrées infinies, quelquefois sur de la mie; nous pensons toujours à vous en les mangeant; mon fils y marque toujours ses dents, et ce qui me fait plaisir, c'est que j'y marque aussi toutes les semaines; nous y mettrons bientôt de petites herbes fines et des violettes.

It was her constitutional gaiety, her quick response to every shade of feeling in those around her, which made all things enjoyed in company worthy of her pen. Her tears flow readily. She writes of herself "Je suis pleureuse." An act of heroism, the loss of a faithful servant, immortalized in a very tender eulogy, equally invoke them. But a cheerful view of life is one of the charms of her writing. When she is well, she plays with her own gaiety and keen sense of life, moralizing all the while. *A propos* of the constant medical remedy—bleeding—then in vogue, she writes from the country at the age of sixty-four:—

Pour moi, si j'avais besoin d'une saignée j'en viendrais mon bras à Paris; c'est une de mes raisons pour être attentive à ma santé. C'est cet état de perfection qui n'auroit qu'un défaut, que je pourrais bien être immortelle, si par malheur je ne lisais des livres où je vois mourir si grande quantité de monde, à tous âges et en tous temps, que quand je quitte le livre je vous avoue que je me dote de quelque chose; rien au monde ne fait tant cet effet que le flux et le reflux qui roule depuis tant de siècles. Ce fut sans doute au sortir de cette lecture que je vous alla dire étourdiment, sans réflexion et étonnement, que je pourrais bien être mortelle.

Her liveliness is always strong in its good sense—i.e. she puts the conclusions of good sense with a vivacity full of individual character. This is partly owing to a certain gravity of appreciation where other people are apt to conceal their interest under an affected levity. Thus of her dress:—"Je suis dans le mouvement de l'agitation de mes habits; je suis partagée entre l'envie d'être bien belle et la crainte de dépenser." Again, when she describes a *perruque* designed for the *fumée* of one of her daughter's friends:—

Je passai mercredi chez la D'Escars; je montais d'envie de voir la perruque, mais elle étoit emballée. Elle m'assura que c'étoit la plus belle chose du monde, la plus vive, la plus décevante, la plus naturelle, la plus parlante, la plus jeune, la plus ondoyante, la plus blonde, la plus surprenante; et que pourvu que Montgobert y voudrait seulement passer les doigts elle seroit aussi bien après le voyage qu'en partant de Paris. Mais cette bonne D'Escars étoit bien en colère contre la donnée; il en coûta plus de cent francs.

Her mind, poetical as well as acute and practical, throws itself heartily into country life when obliged to live in the country. She makes discoveries in nature, and asks her daughter "ce que c'est

qu'un printemps," and what she thinks the colour of the trees during the last week—"Vous allez dire du vert. Point du tout, c'est du rouge"; and then follows a very graceful description. She compares the nightingales of Brittany and Provence:—"La petite rivière qui est dans cet endroit en attire deux ou trois, mais fort inférieurs aux vôtres; ils n'ont ni tant d'amour ni tant de science; à peine disent-ils les couplets les plus communs."

Money is a constant topic. She can't get her rents; for she says of her Breton tenants, "Je ne vois que des gens qui me doivent de l'argent et qui n'ont point de pain, qui couchent sur la paille et qui pleurent; que voulez-vous que je leur fasse?" Perhaps it was not only the burdens laid upon the peasantry that produced this miserable destitution, for elsewhere she gives her son's definition of a Breton:—"C'est un homme qui ne se lève jamais que pour boire, et qui ne se couche jamais que pour avoir bu." She has to apologize to her daughter for having said in an offhand way that she must find money and pay their *grandes dettes*:—"car du reste je ne trouve rien de plus miraculeux que de trouver de l'argent." She has small debts of her own which compel her to give up a winter in Paris—an unspeakable sacrifice to honesty—under the resolve "de finir ma vie avec honneur et sans que personne se plaigne de moi." The inner life of struggle and difficulty which the great people lived amid all their pride and splendour is curiously brought out in these familiar letters. We see the wrong side of the tapestry. Another fact incidentally comes out which bears upon recent discussions. She writes (1694) to her daughter after a journey:—"Je suppose que les voleurs de Vincennes auront laissé passer; ceux que vous avez trouvés en chemin, pendus et roués, étoient ou doivent être des passe-ports."

The great charm of these letters is the writer's absolute freedom from vanity, effort, or consciousness. She receives praise for them, and is glad that they please; but she never alludes to her own successes; we hear of no social triumphs; it is through her love for her friends that we learn their estimate of her. She has a fine ear for style. She talks of somebody's *chien de style*. She gently disclaims her daughter's comparison of her own to that of Voiture; and we only once detect the recognition of her powers when she says of a favourite dependent, whom she sometimes gets to write her reports of health, "She writes like us." But we gather her ideal of a letter from the pleasure she takes in one from her granddaughter, the eventual inheritor of her own letters:—

Mon fils est transporté de la lettre de Pauline. Elle est toute jolie, toute naturelle, toujours toute pleine de reconnaissance de l'amour qu'on lui fait l'honneur d'avoir pour elle. Elle ramasse ce qui tombe, ou attrape ce qui est en l'air, du style de sa chère maman.

The recipe is a good one, but it requires some touch of kindred genius to profit by it.

BRIGHTON AQUARIUM CASE.

WHEN the question as to the opening of the Aquarium at Brighton on Sundays was under discussion in 1875, it was clearly foreseen that the Bill which the Home Secretary had introduced as a compromise would leave the law very much as it was, with the addition of a troublesome element of uncertainty; and that it was, therefore, not really a settlement of the difficulty. The question was raised under the Act 21 George III. c. 49, which was passed to "prevent abuses and profanations of the Lord's day, called Sunday," and had special reference, first, to a Sunday evening promenade held at Carlisle House in Soho Square, which Bishop Porteus, the chief promoter of the Bill, denounced as "a new species of dissipation and profaneness"; and, secondly, to Sunday evening meetings which were held in public rooms, under the names of Christian Societies, Religious Societies, Theological Academies, and so on, and at which—here the Bishop is again our authority—all sorts of theological questions were discussed by ignorant and unauthorized persons, "to the destruction of all religious principle." It will be observed that, as to the second of these objects, the Act has no bearing whatever on such an establishment as an Aquarium; and as to the former, the ground of prohibition was that it was a place in which, as the proprietors said, people merely walked up and down, talked, and drank tea and coffee, but which Bishop Porteus declared, probably with some degree of truth, to be chiefly frequented by disreputable persons for immoral purposes, a charge which has not been made against the Brighton Aquarium, and, even if it had, would be simply a matter of police. The Act is therefore practically obsolete, and does not in the least apply to the circumstances of the present day. It was entirely lost sight of during a long series of years, until it was raked up in 1875, and there can be no doubt that it was only to this oblivion that it owed its slumbering existence. Nevertheless, as it is still part of the statute-book, the courts of law have of course no alternative but to give effect to it; and though, in point of fact, its provisions have no relation to the place of public amusement which is attacked, and which was expressly sanctioned by a private Act of Parliament in 1869 as a provision for useful and agreeable recreation, there is sufficient vagueness in its language to compel the Judges to decide that the Aquarium came within the letter, if not within the spirit, of the statute. Justice Blackburn, in delivering his opinion, said he was afraid the Act must be enforced in this case, although he had been anxious to find a hole by which he might avoid such a decision. Justice Field took the same view, that, as long as the law remained, they were obliged

to act as they had done, though reluctantly. Thus, while the original purpose of the statute has been quite exhausted, the provision remains in force by which a common informer is enabled to claim a penalty of 200*l.* from any offender. In consequence of this decision, the Home Secretary, who avowed his own sympathy with reasonable freedom, and undertook to do what he could to check any abuse of the powers of the law, brought forward in 1875 a measure, called "the Remission of Penalties Bill," in fulfilment of this pledge, by which it was declared to be "lawful for the Crown to remit, in whole or in part, any penalty, fine, or forfeiture imposed or recovered for any offence under the Act." The Home Secretary was then asked, on behalf of the Brighton Aquarium and other similar establishments, to protect them against all fines being levied against them; but he refused to do so in general terms, and adhered to his original proposal to reserve the right of the Crown to remit them whenever it should think fit.

The Bill was accordingly passed in this form; but it was obvious to any one who examined its provisions that it left the question very much as it was before. In dealing with this subject at the time we predicted the unsatisfactory state of things which has now arisen, and suggested a simple and effectual remedy, which was that, as the Home Secretary, in order to remove any doubt as to his power to remit fines under this Act, had found it necessary to introduce a Bill to that effect, he might, while he was about it, also propose a clause requiring the assent of the Law Officers of the Crown as an indispensable preliminary to a prosecution. In this way the general principle of the Act would be maintained, while at the same time its enforcement would be left to the discretion of a responsible authority who is naturally sensitive to public opinion, and not at all likely to be led into foolish attacks on social freedom. If in any case the Government thought it necessary to direct a prosecution, there would be a strong presumption that it was really required in the interest of morality or public order. Thus the judicial decision of last week might have been averted if the suggestion which we made, and for which a precedent may be found in the case of a similar statute of Charles II., had been adopted a couple of years ago. During that interval the legal obligations of the Aquarium have been kept in suspense. The managers have, it appears, complied with all the suggestions of the Home Office as to the manner in which the Aquarium should be conducted on Sundays—such as the cessation of music and newspapers, and the closing of the restaurant during certain hours—so as to obviate the objections which some persons might have. But nevertheless any common informer is allowed to exact, and, if he chooses, to pocket, a fine of 200*l.* for an infraction of the Act of George III.; and, though it is in the power of the Home Secretary, if he thinks it fit, to remit the penalty, this is a matter which is left entirely at his discretion, and, in the absence of any distinct rule, there is no saying how he may at any time decide.

The recent action of *Girdlestone v. the Brighton Aquarium Company* appears to have been begun as far back as August 17, 1875; but the prosecution has been delayed, bringing up the amount of penalties impending for opening on Sundays to 1,400*l.* or 1,600*l.* There were, it will be remembered, two previous cases of common informers' proceedings under the old Act. In 1874 Mr. Terry was the prosecutor, and there was a decision against the defendants. Afterwards there was a "friendly suit," *Warren v. the Brighton Aquarium Company*, and a case was stated for the opinion of the Exchequer Court, when, as Mr. Russell said, the Solicitor of the Treasury acted entirely in a friendly way. It came before the Court on the 11th June, 1875, and the decision was again unfavourable to the Aquarium Company, though the Judges expressed regret that they had no alternative but to enforce the Act. In December 1875 Mr. Rolfe, holding a position in a public office, brought a series of actions to recover statutory penalties from several newspapers and a Railway Company which had published advertisements of the Aquarium; and, according to a statement made the other day by Mr. Russell, who appeared for the Company, Mr. Tilden, their solicitor, found that "Mr. Rolfe was amenable to argument," and ready to withdraw from the action on the payment of a sum to meet his costs and expenses. After, however, Mr. Girdlestone's action was raised, an arrangement was made between the Company and Mr. Rolfe that he should lend his name as plaintiff in an action for penalties which covered all the Sundays on which the Aquarium had been opened, but was not to receive anything for it; and at the trial, on the 28th of October, the Company made no defence, and judgment for 2,000*l.* was marked against them. That was in April 1875. Mr. Girdlestone's action for a recovery of the penalty for the Aquarium having been open on Sunday the 15th of August, 1875, has now been tried; and again the judgment has been against the Company. For the plaintiff it was argued that the judgment in Rolfe's case had been obtained by covin and collusion; and, though the defendant denied this, and the Solicitor-General, who appeared for the prosecution, admitted that, as a lawyer, he could not say what was the precise meaning of covin, Baron Olesby held that the charge had been proved, and pointed out that effect must be given to statutes as they existed, whatever might be thought of their character; and the jury returned a verdict for the plaintiff to the amount claimed.

Thus, as matters now stand, there have been several actions in which the Aquarium Company has had penalties imposed on it, and it would seem that the Home Secretary is not prepared to direct the remission of them. It is evident therefore that, while the law remains

as it is, these continuous proceedings against the Company practically involve a prohibition of the opening of this Aquarium on Sundays. Moreover, the law applies indiscriminately to all kinds of public amusements, however quiet, innocent, and respectable, on a Sunday, when any payment is made for admission. At the trial in 1875 the Solicitor-General, in reply to the Chief Baron, distinctly stated that, apart altogether from any performances, any park or garden would come within the Act if people paid to go in; and it was at the time also admitted by the Home Secretary that this was a sound ruling, and must be generally applied. At the Brighton Aquarium the Home Secretary's views have apparently been fully carried out as to stopping the newspapers and the music, which on Sundays has always been of a sacred kind, and limiting the time during which refreshments can be obtained; and the building is used only as a promenade, enlivened by the sight of the fishes. But all this does not matter. The Act is construed as making such a place a "disorderly house"; and the Home Secretary hesitates to remit the fines. It is clear that an establishment of this kind cannot be kept up if it is constantly exposed to actions for penalties raised by "common informers," for reasons which may or may not be honest and disinterested. No aspersion can be fairly cast on the character of the visitors to the Aquarium, who walk quietly up and down, and conduct themselves with unquestionable propriety, as there is the evidence of the police to show. Yet it is held that this place must be shut up on Sundays, while there are any number of public-houses and beer-shops outside to which people go for the sole purpose of drinking, and where they find nothing whatever to supply interest or amusement. This is certainly a very strange way of encouraging temperance. There is no subject on which it may be assumed that the great body of the people of this country are so perfectly agreed as that the observance of Sunday ought to be quiet and orderly, and an interval of healthy repose in the best sense of the word; but, on the other hand, there is no desire for the enforcement of Puritanic dullness and solemnity. There are some cases, of course, in which restrictions require to be applied, and there must be some authority to deal with such matters; but the present system of leaving it to any fanatics or jobbers to extort money by help of law from the proprietors of respectable places of amusement, which do not offend the general sense of propriety, is altogether indefensible, especially when the difficulty might, as we have shown, be so easily adjusted. All that need be done is the passing of a single brief clause, making the assent of the Attorney-General a necessary condition of bringing an action of this kind.

FREE BRIDGES.

A VERY useful measure has almost run its unpretending course through Parliament. With that patience, at once so Christian and so unreasonable, which characterizes Englishmen in the conduct of their municipal affairs, the inhabitants of London have for many years endured to see the passage of the Thames barred at many points against all who were not possessed of, or ready to produce, a halfpenny toll. It was inevitable perhaps that the older metropolitan bridges should thus discourage the traffic which they were intended to facilitate, because, before the creation of the Metropolitan Board of Works, there was no authority outside the City which had the power to charge the ratepayers with the cost of building new bridges. But it is strange that the Board of Works should have been in existence so long, and have done so much, and yet left the bridges to continue private undertakings. They were rarely, if ever, successful undertakings; for there is something in human nature that specially resents a toll-gate. If travellers can avoid passing through one, they will; and as by going some way round it was usually possible to find a free bridge, the toll-bridges were a good deal less used than their sanguine builders expected. It may have been owing to this circumstance that the Board of Works left them so long unnoticed. The Corporation of London set a good example in freeing Southwark Bridge; but it was not until 1873 that any serious proposal was made to deal with the twelve toll-bridges that remained between Hammersmith and Deptford Creek. After two failures, a Bill was very nearly carried through the House of Commons last Session. It broke down, however, at the last moment upon a question arising out of the respective liabilities of the metropolitan ratepayers and the inhabitants of the metropolitan counties of Surrey and Middlesex. This year the Board of Works has been more successful. The ten toll-bridges will be purchased by the Board of Works within two years after the passing of the Act. For the payment of the purchase-moneys and for compensation* to the various interests affected by the dissolution of the several Companies, the Board is empowered to borrow 1,500,000*l.*, and the counties of Middlesex and Surrey will contribute 1,200*l.* a year each for ever, this payment being accepted as a discharge of all liabilities to which the inhabitants may now be subject for the repair of any bridge. The two foot-bridges at Charing Cross and Cannon Street will continue to be kept up by the South-Eastern Railway Company, the money paid in this instance merely going to extinguish the tolls. It is to be presumed that the Company will not consider it any part of their contract to replace the disreputable wooden steps which now give access to the Charing Cross bridge by something more worthy of the site,

and of the massive, if ugly, structure to which they are attached. In that case the Board of Works will be bound, in common justice to their own Embankment, to make a proper approach to the bridge. The present steps were apparently modelled upon the wooden gangways which used to connect the old floating piers with the shore. They were in place when they abutted on a mass of tidal mud, but they have no proper connexion with the long line of quay upon which they now look down.

It will be interesting to see the effect which this measure will have upon the vast traffic which has daily to pass from one side of the river to the other. Those who are inclined to be too hopeful about the ease with which they will make the passage of the Thames now that the travellers are distributed over so many additional roads may perhaps be chastened by the recollection that the worst complaints about the block on London Bridge have been heard since Southwark Bridge was opened free. But Southwark Bridge is not fortunate in its approaches. On whichever side you leave it you find yourself in a region in which you have no business and out of which there is no visible escape. It is impossible not to cherish brighter hopes of Waterloo Bridge. A road that leads straight from one of the most crowded streets to one of the most used of London railways ought to be full of passengers, at all events in the morning and evening. As a matter of fact, there are just enough cabs to maintain a block at the toll-gate, and when it is considered that, in accounting for this block, the time necessary to find the twopence or the change from a larger coin has to be reckoned in, it will be seen that this represents but a moderate amount of substantive traffic. There can be no doubt that at present people do go out of their way to escape a toll, because, in addition to the *a priori* argument derived from the observed tendencies and dispositions of mankind, there is the positive evidence of one of the directors of the Albert Bridge Company. The Chelsea Suspension Bridge is the property of the Government, and is open free on the four Bank Holidays. Mr. Newmarch considers this a most unjustifiable act, and he gives as his reason that his Company have "suffered a confiscation of tolls to the extent of twenty pounds on each occasion." If the Chelsea Bridge were altogether free, the Albert Bridge Company would, he thinks, be ruined, because the traffic would all go over the free bridge. The Chairman of the Hammersmith Bridge Company says that, when Kew Bridge was freed from tolls some four or five years ago, the Company lost from three to four hundred pounds the first year, though there is a distance of two miles between the bridges. In a great many cases in London there is really no reason except the existence or non-existence of a toll for going over one bridge rather than another. This holds good especially of Westminster, Waterloo, and Blackfriars Bridges; and it is quite possible that the traffic which is now mainly confined to the first and last-named bridge may in future be distributed pretty evenly over all three.

A still more important benefit will perhaps be conferred by the redistribution of foot traffic which may be looked for. Two of the most promising sources of discomfort in London are overcrowding among the poor, and the difficulty of finding houses at moderate rents among the classes immediately above the poor. The abolition of toll-bridges ought to have some effect in both these cases. A large proportion of the working class find it necessary, or all but necessary, to live within an easy distance of their employment. The man who works at a regular trade in which the hours are fixed—and a workman is never wanted except within those hours—may be able to live near a railway station a mile or two off. But that large number of persons whose labour is essentially occasional and uncertain, including under this head all the dependents on richer people, and those who in turn supply the wants of these dependents, must live pretty close to their work. The opening of a bridge may make a very great difference to this class as regards overcrowding. The Surrey side of the Thames is now absolutely closed against many of this class. If they work anywhere in a direct line north of Waterloo Bridge, they must either go some way round to get over the river, or they must pay a halfpenny each time they go between their work and their home. Both alternatives are equally out of the question. They cannot spare the time needed to go round, and they cannot spare the money needed to go straight. Consequently, they have to live as well as to work on the north side of the river, and then overcrowding follows as a necessary consequence of the scarcity of room and the costliness of rents. The abolition of the toll on Waterloo Bridge may make all the difference to these people. Even to a class a good deal above them the same considerations may have real weight. A halfpenny is not a large toll, but a halfpenny daily means sixpence a week, and sixpence a week means more than a pound added to the yearly rent. Indeed it means in most cases a good deal more than this; for after the first few years there are usually children to be paid for whose schools or work may lie on the wrong side of the bridge. Perhaps, on an average, the toll would be tantamount to an addition of 3*l.* to the yearly rent; and when a prudent young clerk is hesitating where to live, it makes a difference to him whether he has to pay 15*l.* or 18*l.* a year for lodging. It is safe to say that the more freely the population of London is allowed to circulate from one part of the city to another, the better able it will be to make the best of the circumstances under which it has to live; and, looked at from this point of view, the present Bill may be as useful as many measures of considerably greater pretensions.

THE COTTON MANUFACTURE IN ENGLAND AND AMERICA.

FOR a long series of years the American people have supported a policy of protection to native industry for the purpose of making themselves independent of the manufactures of foreign nations. Within certain limits, it must be admitted, they have succeeded. Their policy has been aided by a variety of favouring circumstances. The discovery of gold in California added enormously to the purchasing power of the country; the vast influx of immigrants from Europe increased the population at an unprecedented rate; the immense sums lent for industrial objects by the capitalists of London, Amsterdam, and Frankfort augmented inordinately the expenditure of the community; and the constant extension of the railway system, by pushing the limits of cultivation further and further forward, every year increased the national prosperity in an unexampled way. These and several other co-operating causes multiplied to an exceptional degree the consuming power of the people, and, as a prohibitive tariff shut out foreign goods to a very large extent, they stimulated in the same proportion the growth of native manufactures. Whether those manufactures will be able to sustain competition remains to be seen whenever protection is abandoned. In the meantime, however, they make the United States as nearly self-sufficing as in the nature of things the most sanguine American could expect. But it is beginning to be found out that the success has been too complete. The natural and inevitable result of the bounty offered to manufactures was to tempt into them an immoderate proportion of the capital, labour, and enterprise of the country. It has for many years been a standing complaint with American observers that the rural districts were being exhausted for the benefit of the urban. Indeed the steady migration of the sons and daughters of the farmers into towns was one of the evils which the Granger movement was intended to redress; and it is notorious that an undue proportion of the emigrants also settled down in the cities. In fact, the artificial preference given to manufactures over agriculture had the effect of multiplying manufactures unduly. As long as foreign capital continued to flow steadily in, the consequences were not recognized. Americans did not perceive, or were unwilling to acknowledge, that their prosperity was due to foreign contributions of men and money, and they flattered themselves that their country was exempt from the laws of political economy. But the end was all the more severe for being long postponed. Four years ago there was a panic which destroyed the prosperity that had seemed so vigorous, and ever since trade has been stagnant, and manufactures at a standstill. For the moment, at any rate, production, which had so long been subjected to the forcing process we have been describing, finds itself far in excess of the consuming power of the population. In their distress manufacturers are looking out for new markets, and are endeavouring to establish an export trade. It is evidence of the purely artificial growth of these industries that even in the present depressed state of business they are unable to undersell foreign competitors in foreign markets. However, the American manufacturers are persevering, and the most recent proposal is to compete with Lancashire in cotton goods for the custom of India and China. When the cotton exports of the United States at present amount to only one-fiftieth part of those of the United Kingdom, it may perhaps be thought a wild adventure. It is, however, never wise to despise a competitor. Every human enterprise must have a beginning some time or other; and therefore this project should not be pronounced hopeless because it is as yet only a project. In any case, it is worth while inquiring on what grounds success is anticipated.

The main ground relied upon is the greater cheapness of the raw material. Considering all that we hear of the difficulties thrown in the way of the manufacturer by labour disputes, by the rise of wages, and the obstructiveness of the Trade-Unions, it will perhaps surprise most persons to be told that in ordinary cotton goods the raw material stands for from 45 to 70 per cent. of the cost of production, whereas labour amounts to no more than 17 to 27 per cent. The raw material, that is, is from nearly twice to more than four times a heavier item than labour. This fact proves how much more important to the prosperity of the industry are improvement in the mode of cultivation, cheapening of carriage, and saving of waste than any reduction of wages. But the American manufacturers assert that they can provide themselves with cotton at a price three-quarters of a cent. per pound lower than Lancashire spinners can do, and that this saving allows them to pay 33 per cent. higher wages. There is a curious dispute on this point which illustrates the difficulty of ascertaining what might seem to be the simplest facts. For some Liverpool authorities deny the correctness of the New York statement. It is to be borne in mind that the American manufactures of which we speak are not situated in the Southern States. If they were, there could of course be no room for doubt. They would be on the spot where the cotton is grown, and naturally would obtain it very much cheaper. But the manufactures of the Southern States are unimportant. Those which think of competing with Lancashire are situated in New England. Now the distance from New Orleans to Fall River, or Providence, is practically as great as the distance to Manchester. By railway, indeed, the distance would be much shortened; but, on the other hand, the cost of carriage would be considerably increased. At the same time, however, it is to be observed that the cotton would be received in a drier and cleaner condition. On the whole, then,

the evidence is by no means conclusive that the manufacturer of Massachusetts or Rhode Island can obtain his cotton so much cheaper than it can be had in Liverpool as to make a material difference in the cost of production. Liverpool has one immense advantage over all rivals; it is not merely the greatest market in the world, it is nearly equal to all other markets put together. It consequently regulates prices everywhere; and growers can always be sure of finding purchasers for any quantities, however large, which they may send. This circumstance naturally makes Liverpool a cheaper market than any other at nearly the same distance from the cotton-fields.

Another allegation of the American manufacturers is that the cost of labour is now as low in New England as in Lancashire. We have already seen that this matter has less importance than is usually attached to it, since labour amounts to only a fifth or a fourth of the cost of production. Still dear labour, added to other disadvantages, would overweight a competitor. The matter is therefore of moment. But it is impossible to decide whether labour is really dearer or cheaper in New England than with us. High wages by no means imply dear labour. Mr. Brassey tells us, on the contrary, that his father found the highly paid English navy a cheaper workman than the poorly paid Continental. Evidently it is not the amount paid, but the work obtained for it, which is of consequence to the employer. There is another circumstance which complicates the question in the case before us. It is that women and children are more generally employed in the mills of Lancashire than in those of New England. Even, however, if we agree that labour is as cheap in America as here, that would not affect the problem of competition. For it is quite clear that wages have fallen so low only because of the unexampled distress that prevails. As soon as business revives and employment becomes plentiful, wages will again rise. But production for the foreign market is determined, not by the rates existing at exceptional periods, but by the normal and usual rates. There is one aspect, however, in which this question of wages is supremely important. It proves conclusively that to the poor man Protection is doubly oppressive. It makes the articles he buys artificially dear, and it diminishes the value of his labour. The rate of wages is now nearly at the same level on both sides of the Atlantic. Actually, however, it is lower in New England, because the cost of living is greater there than here. Our statement is proved by the fact that more steerage passengers returned from America last year than went there, showing that the market for labour there was worse than here. It may be objected that the present is an exceptional time. And so it is. But Mr. Henderson, one of the Factory Sub-Inspectors, tells us, as the result of his inquiries in New England last summer, that even in prosperous years the condition of the working classes is no better there than here; they receive higher wages, but the cost of living is also proportionately higher.

Another ground relied upon by the American manufacturer is the fall that has taken place within the last four years in the other charges of working a factory. Here, again, the mistake is made of assuming that a state of things which is the direct result of over-production, panic, and consequent stagnation, will be permanent, and will enable mills to be worked more cheaply than they ever could have been before. It is only necessary to call attention to the error. In ordinary times it costs nearly twice as much to establish a factory in New England as in Lancashire, and the capital so invested bears nearly twice the rate of interest. But it is what prevails in ordinary times that regulates production. Moreover, the division of labour is not carried as far in America as in this country; consequently much of the capital lies idle. Lastly, the motive power employed is not as effective, as constant, or as certain, and it is not cheaper. It follows that, as regards all these circumstances, the American manufacturer labours under a disadvantage. There are, however, two important points to be noted in his favour. The first is that the American workpeople are more temperate than the English. Mr. Henderson states that labour disputes are quite as frequent and bitter in New England as in Lancashire, though the dispersion of the operatives renders the Trade-Unions less powerful. The source from which the supply of factory hands is now mainly drawn—the French Canadian population—is also a fruitful cause of difficulties. On the other hand, the operatives are more sober, and consequently are more regular and more trustworthy. The other advantage to which we referred is the greater honesty of American manufacture. It is not a gratifying admission to have to make that, in this matter at least, American honesty is superior to our own; but it is the truth. The cotton fabrics exported from Lancashire to India and China consist very largely now of flour, tallow, and China clay. Some authorities assure us that these ingredients constitute half the weight. They give a cloth a substantial appearance, but they disappear on the first washing, and then the daylight shines through the fabric. The dishonesty of this practice is the worst danger the English manufacturer has to encounter, and, if continued, it must sooner or later prove fatal.

THE ROYAL ACADEMY.

I.

BEFORE the opening of every Exhibition of the Royal Academy prophecies are delivered by various wise persons as to the merits of the coming show; and when the galleries have been

thrown open, it is tolerably certain that opposing parties will be found to assert, the one that it is the best, the other that it is the worst Exhibition that has ever been seen. A certain number of people no doubt may always have intelligible reasons for objecting to the Exhibition on personal grounds, while others, in their individual delight, may be blinded to its general faults. This year an additional excitement is afforded to the curious by the opening of the Grosvenor Gallery, concerning which very vague notions have been generally entertained. It has been supposed to be, among other things, either a home for pictures rejected by the Academy or a daring opposition to that august body. The fact that Academicians have contributed to it is enough to prove that both these ideas were false. The foundation for them will be discovered to lie in the fact that advantages of space have enabled Sir Coutts Lindsay to dispose his pictures far more satisfactorily than can be done on the crowded walls of the Academy. Rivalry, however, cannot be said to exist between two institutions of which one is, as it were, the complement of the other. Perhaps, if the Royal Academy were that impossible thing, a perfect institution, there would have been no room or occasion for the Grosvenor Gallery, the opening of which ought to subdue the troubled minds of people who have been used to protest that in London there is no chance of pictures being really seen.

Returning to the Academy and its general merits this year, it would seem that, while there are not many works of any startling prominence, the general level is at any rate not lower than that to which we have of late years been accustomed. It is noticeable that there are many instances both of young and established painters from whom much might have been expected, but from whom little has come. One or two young men have come suddenly to the front, while others who seemed full of promise have as suddenly disappeared. As to the general character of the pictures, what is at a first glance most striking is the want of interesting subjects, or, in other words, the want of imagination, except such part of it as finds expression in landscape and portrait. It would seem that the tendency of English art as here represented is to aim at reproducing reality with good workmanship more than at grappling with ambitious subjects; to strive after technical skill more than imaginative force. This tendency cannot be called altogether disappointing. Of course the highest form of art is reached when technical excellence is joined with deeper qualities, and acts as the well-trained slave of the poetical mind. But this combination is rare indeed; and it must be remembered that the great painters have all learned to paint well in the first instance, and that it is far easier to credit oneself with a vast imagination than can dispense with exactitude in drawing or colour than it is to learn patiently the nearest possible approach to that exactitude. For the rest the Academy walls present as usual many hideous, but possibly inevitable, contrasts of incongruous pictures placed close together; while some unusual and obviously needless eccentricities of hanging and painting serve to indicate a lively sense of humour in the powers that rule the Academy.

Taking a general view of the rooms, which is all that can be attempted at present, we come upon Mr. Millais's much-talked-of "Yeoman of the Guard" (52), a portrait which from its colour alone it is impossible to help at once seeing, and of which we reserve all detailed criticism. A portrait by Mr. Oulless of Miss Ruth Bouverie (13) is remarkable as the painter's first attempt in this particular line. Mr. Goodall also appears with success in an unaccustomed line in his cattle-piece, "Glencroe" (2), while Mr. Pettie and Mr. P. F. Poole are in different kinds too theatrical in "Hunted Down" (28) and "Leading the Blind" (37). Mr. Dicksee's "Harmony" (14) will be more admired for colour and drawing than invention. Mr. P. Graham has "A Glimpse of Sunshine" (46), Mr. Marcus Stone "Sacrifice" (51), and Mr. G. A. Storey "The Old Pump-Room at Bath" (67), of all of which we hope to speak later. In Gallery II. Mr. Long's large picture, "An Egyptian Feast" (83), will at once attract attention as the only subject picture of great importance of the year; and in this the interest is archaeological rather than human. The picture, which represents the close of a banquet with the guests seated in a semicircle, while two slaves drag a mummy round to remind them of death, has many fine qualities, and shows much study and improvement in the painter. One cannot say as much for Mr. B. Riviere's "Legend of St. Patrick" (70). There is a lovely "Study of Flowers" by M. Fantin (74), and on the opposite wall to Mr. Long's picture hang "The Seasons" (117-120), four panels, by Mr. Alma Tadema, executed in one of the painter's happiest moods. In the same room are portraits by Mr. Watts and Mr. Richmond (125, 131). Miss Koberwein and Mrs. Jopling are here as elsewhere well represented in the same line (73, 74). Mr. Pettie's "Knight of the Seventeenth Century" (96) will prove interesting both for its intrinsic qualities and because it is the likeness of a well-known and popular author. Here also is "Word from the Missing" (126), one of the best of Mr. Hook's contributions.

In the Great Gallery, among the figure pictures, we may in this cursory view point first to Mr. Long's graceful "Ancient Oustom" (163), Mr. Orchardson's "Queen of the Swords" (174), Sir John Gilbert's "Cardinal Wolsey" (205), Mr. Pettie's "Sword and Dagger Fight" (203), and Mr. Caddell's scene from Tennyson (215), and contrast their varying degrees of merit with the complete and almost amazing despatch of Mr. E. M. Ward's "William III. at Windhoek" (197) and Mr. Cope's "Spring

Time" (220). One's first impression on seeing the latter of these two productions is that here at least is a goal reached; here can one rest, secure that there is no further depth. By looking, however, at Mr. Hart's "Reflection" (259), we learn how feeble a thing is human imagination. A portrait of great importance (272) comes from Mr. Pettie, and others are sent by Messrs. Oulless, Watts, Richmond (269, 267, 281), and from Sir F. Grant (202, 263). Mr. John Gollmer, who can scarcely be said to have appeared on the Academy walls before this year, has produced, in his portrait of Major Forster (495), a striking work which commands attention. Mr. Stuart Wortley's portrait of "The Countess of Wharfedale" (240) suffers from being hung too high. Among the landscapes, Mr. Millais's "Sound of Many Waters" (273), which to our thinking is unpleasantly hard, will probably attract most attention. In the "Music Lesson" (209) Mr. Leighton has given us an exquisite piece of drawing and colour, the loveliness of which goes far to atone for the unloveliness of many things which hang near it.

In Gallery IV. we may for the present note Mr. Marks's "The Spider and the Fly" (313), a work which is, we think, inferior to a smaller one in the Great Gallery (246); Mr. Carl Hoff's clever *genre* piece, "A Tale of Two Conquests" (332); Mr. Mark Fisher's charming landscape (364); Mr. Bridgman's "Towing on the Nile" (344); and Mr. Phil. Morris's "Hen of the Manor" (374). Besides these we have works from Mr. Leslie (379), Mr. Hook (337, 380), and Sir J. Gilbert "Dora and Servitors of Venice" (366), who is here, as far as colour goes at least, more fortunate than in his larger work already noticed. In Gallery V. are "Yea," by Mr. Millais (409), a work which seems too hurriedly executed; a glowing evening scene on a river, "Arundel" (432), by Mr. Vicat Cole, close to which is a morning river scene of far quieter tone, "Newcastle-on-Tyne" (431), by Mr. John G. Donnor; and a tender piece of Mr. Boughton's work, "Homeward" (452). Calling attention also to Mr. Waller's "Home" (453) and Mr. A. Moore's "A Reader" (469), we go on to Gallery VI. Here we should note Mr. Poyater's diploma picture, "The Fortune-Teller" (503), Mr. Linnell Senior's "Autumn" (552), Mr. H. Moore's sea-piece (489), and Mr. Oulless's fine portrait, perhaps his finest, of the "Right Hon. Russell Gurney, Recorder of London" (496). Mr. Calthrop has a good study of French peasants "After Work" (193), and Mr. Watson Nicol two clever figure studies (516, 536). Mr. Watts's "The Dove" (566), which "returned not again any more," is, however, the most striking picture in the room, and has much poetical feeling besides technical worth.

There is much true feeling also in the triptych of the story of Ruth (574-576), contributed to Gallery VII. by Mr. T. M. Rooke, a young painter who seems to have studied the works of Mr. Burne-Jones to good effect. In the same room are Mr. Alma Tadema's "Between Hope and Fear" (597); Signor Tito Conti's "Introduction" (613), a clever work in the French school; Mr. Ethofer's "Scene in Rome" (623), an equally clever attempt in the school of Honor Fontany; Mr. Goodall's "Water-Carriers in Egypt" (614); and a completely charming wood-scene with figures, "Snow in Spring" (640), by Mr. Boughton. Leaving aside for the present the Water Colours, we find in the Lecture Room important works by Mr. Brett, "Mortat's Bay" (946); Mr. Philippoteaux, the "Alma" (937); Mr. Herkomer, "Der Bittgang" (916); and Mr. Yeames, "Amy Robarts" (1029). Mr. Fildes is hardly as successful as he should be in "Playmates" (1059); while Mr. R. W. Macbeth, in his "Potato Harvest in the Fens" (1031), has reached a combination of excellence in invention and skill which he has never before attained. Probably the great attraction of this room will be found, not among the paintings, but in the fine sculpture of Mr. Leighton, who, like several other artists, including M. Gérôme, has tried his hand at the chisel after long devotion to the brush, and has produced as a first result the figure of an "Athlete Wrestling with a Python" (1466), which, in spite of some faults of execution, will be found to contain much strength and beauty. This is faced by a terra-cotta work of M. Lalou, "Une Boulonnaise allaitant son enfant" (1465), a subject which this artist has perhaps now resorted to often enough. In Gallery X. we can only note in passing a pretty, but risky, landscape by Mr. Leader (1348); "The Dancing Bear" (1323), by M. Adrien Moreau; Mr. Hennessy's "Notre Dame des Vignes" (1384); and a fine head (1350), by Mr. E. J. Gregory.

Of the interesting and important collection at the Grosvenor Gallery, already referred to, we cannot now speak at any length. But, by way of illustrating our description of it as the complement of the Royal Academy, we may briefly point out that there, in some of the most important contributions, imagination, instead of having been suppressed for the sake of workmanship, has, if anything, escaped from ordinary trammels. Mr. Burne-Jones, however, to whose work we particularly refer, is a painter so unusually strong in other directions that he may well afford to lay himself open to the charge of certain faults in drawing. In what direction, if any, may be the strength of Mr. Whistler, whose productions occupy a good deal of space at the same Gallery, we have not yet been able to determine. But to this and other more interesting questions we hope to return.

TWO THOUSAND GUINEAS.

The Middle Park Plate of 1876 could have met again last Wednesday its runner, the well-bought battle, the first of the year, three-year-old races of the present year would

have been one of surpassing interest. This, however, was not to be. Plunger, who, as far as appearances went, had improved even more than Chamant during the winter, failed to stand the necessary course of training, and after every effort had in vain been made to get him fit in time, he was struck out of the race a week ago. The absence of the son of Adventurer and Lina was a sore disappointment to many who believed that he would this year retrieve the laurels he lost in the Middle Park and Dewhurst Plates, and turn the tables on his conqueror in both those events. Still the supporters of Chamant could always indulge the recollection that their champion beat Plunger more decisively in the Dewhurst Plate, over a longer course and at more disadvantageous weights, than in the Middle Park Plate; and though the son of Mortemer and Araucaria has not grown as much as might have been wished, yet he has never been amiss during the winter, and his style of going and the manner in which he has done his work have left nothing to be desired. The form of Lady Golightly, on her Doncaster running, was perhaps the best of the year. She won the Champagne Stakes in a common canter, Chamant never being able to live with her; and she beat Verneuil for the Wentworth Stakes with equal ease. Then came that terrible finish for the Middle Park Plate in which Chamant, Pellegrino, Plunger, and Lady Golightly ran locked together, heads only separating them as they passed the judge's chair. Lord Falkmouth's beautiful filly was carrying the extreme weight, and the gallant effort she made for victory was too much for her. Very unwisely she was brought out again on the following day for the Prendergast Stakes, and could hardly rouse a gallop against Plunger and Palm Flower. It is much to be feared that the Middle Park Plate struggle was too much for Lady Golightly, just as under very similar circumstances it proved too much for Sunshine. These great two-year-old prizes are tempting, no doubt; but the attempt to carry the prudities for previous successes in them is extremely hazardous. Lady Golightly, like Sunshine, had done a fair season's work before the Middle Park Plate; and just as she was becoming entitled to a little rest she was called on to perform a harder task than any she had previously accomplished. It is to be feared that we shall never again see this beautiful filly in the form she displayed last September. Pellegrino, who came out fresh at the Second October Meeting, received 6 lbs. and a head beating from Chamant; but the Duke of Westminster's horse looked likely to make greater improvement from two to three years than his victor, and the second meeting of the pair was anticipated with much interest. The absence of Pellegrino from the Two Thousand field was not caused by any doubts as to his capacity to distinguish himself, but simply because his trainer had, or thought he had, an equally good representative in Morier, who could carry the Grosvenor colours at Newmarket, while Pellegrino was reserved for the Derby. Morier had never run in public before last Wednesday, and nothing therefore was known as to his merits by the outside world, save that he was a big striding horse who seemed especially adapted to the Rowley Mile. Of course, however, it was known at home in what relation he stood to Pellegrino; and, on public running, unless he was very nearly Pellegrino's equal, he could have little chance of beating Chamant, and then only on the assumption that the son of Palmer and Lady Antley had improved since last year in a much greater ratio than his Middle Park Plate conqueror. Perhaps it was possible, by the help of Julius Cesar, to obtain a still more trustworthy clue to the real merits of Morier. No better trial horse than Julius Cesar could be obtained at the present moment. He beat Touchet last week without an effort, giving him 23 lbs.; and Touchet's friends consider him a high-class three-year-old, worth supporting for the Derby. There could be little difficulty, therefore, in ascertaining through Julius Cesar whether Morier and Pellegrino have not superior claims to consideration among the horses of their year. Besides Chamant, a dangerous candidate was supplied by France in the person of Strachino. This truly-bred son of Parmesan and Old Maid had won two good races at Paris within the last few weeks—the one over a course of a mile and a half, the other over a course of two miles. There was also this to be said for him, that his owner, impressed with the great chance he possessed in the English Two Thousand, had withdrawn him from the Poule d'Essai—the corresponding, but less valuable, race in France—which was decided last Sunday at Paris. For this event Verneuil, the stable companion of Chamant, and, according to trustworthy report, his equal this year, if not his superior, was a competitor; but he was so easily beaten by Fontainebleau, never being able apparently to live the pace at any part of the race, that the position of Chamant for Wednesday's contest was naturally shaken. On second thoughts, however, it seemed safer to trust to the highest public form shown in England in 1876; and the prestige of the winner of the Middle Park and Dewhurst Plates was too great to be overthrown by collateral running in France.

In short, Chamant by the merit of his best two-year-old performances, Morier on the strength of private reputation, and Strachino by virtue of the brilliant victories he has gained this season, appeared to hold all their competitors safe, and the remainder of the not over large field were principally judged with reference to their respective chances of running into the third place. Silvio and Warren Hastings could hardly be expected to have made an improvement of two stones in a fortnight; the gigantic Thunderstone, despite his ten-lengths victory over Monachus and his ruffing Palm Flower to a neck, suffered from the prejudice which always exists against horses of abnormal size; The Rover could only claim that he had finished in the Middle Park Plate well up with the leading

division; and what merit might have attached to The Monk from his second place in the Champagne Stakes at Doncaster, in front of Shillelagh and Chamant, could no longer be set up in the face of the subsequent performances of the latter. Finally, though Brown Prince gained a creditable victory over Pirat at the rocen Craven Meeting, it would have been over-sanguine to infer more from that victory than that the good-looking son of Lexington would represent America creditably in the Two Thousand. All interest, in short, centred in the two French horses, and the solitary antagonist who was believed capable of upholding the honour of England against such formidable foes.

The majority of the eleven runners—the field including, in addition to those we have mentioned, Kingsclere and the Voltella colt—were saddled in the paddock near the stand, the principal absentee being Morier. In the days of Mr. Merry the Russley horses used always to be saddled at the Ditch stables, and we suppose the custom is to be kept up under the present régime. The Duke of Westminster's horse remained favourite up to the fall of the flag, the confidence of his friends in his reported high trial with Julius Cæsar being unbounded; but Chamant ran him very close, and the appearance of the Middle Park Plate winner gave the utmost satisfaction to those who saw him in the paddock. Strachino, on the other hand, went back on its being made known that since his arrival at Newmarket he had developed a very nasty temper. Possibly the East wind blowing across Newmarket Heath was not to his taste. Horses with a savage disposition are seldom to be trusted; and though no fault could be found with Strachino's condition, the muzzle he wore told a tale, and gave rise to ominous misgivings. The remainder attracted comparatively little attention. Thunderstone and Brown Prince both wanted more time, it was generally thought; and Silvio, it was confidently hoped, would make some amends for his indifferent display in the Craven week. Lord Palmouth's representative was the popular favourite for a place, which he fairly succeeded in gaining. The numbers of the eleven competitors were hoisted with Newmarket punctuality, and the starter had no trouble at the post. At the appointed time, almost to a man out, the flag fell, and very soon the gigantic Thunderstone and the strapping Morier were seen in front—the former in the centre of the course, and the latter on the judge's side. Chamant was on the Stand side, but evidently in no hurry to make his way to the front, and before half the distance had been traversed it was plain that Count de Lagrange's horse was playing with his field, and was pulling over them. At the Bushes Morier was in difficulties, and Strachino was beaten, and at this point Chamant wrested the lead from Silvio and Brown Prince, and came down the hill pulling double. In the dip Lord Palmouth's horse and the American attempted to regain their position; but here Goater gave Chamant his head, and the race was over. The Middle Park Plate winner left his two opponents without an effort, and won in a canter without having ever been called upon to do his best. Brown Prince gained second honours from Silvio by three parts of a length—a creditable performance when his want of condition is taken into account—and Mr. Sanford may be congratulated on possessing a three-year-old of more than ordinary merit. Silvio showed, at any rate, that he is not so bad as his running in the Craven week seemed to make out, and how he managed to lose the Biennial is a mystery. Close up with Silvio was the Voltella colt, with Monachus and The Monk as his immediate followers. In the extreme rear were Thunderstone, Strachino, and Morier, while Warren Hastings was pulled up. The utter defeat of the favourite was naturally the principal topic of conversation after the race, and explanations were as plentiful as usual. It was roundly asserted that the Duke of Westminster's horse was lame at the post, and, if that were so, we need not look further for the cause of his discomfiture. But he certainly did not look lame after the race, and it may be that some mistake had been made in his trial. This is by no means the first occasion, however, on which private reputations have had to give way to public performances; and those who make a rule of sticking to public form have had all the best of the bargain this time.

The result of the Two Thousand can hardly fail to have an important effect on the prospects of the Derby. Experience has shown that the winner at Newmarket has often to put up with an inferior position at Epsom, but in most cases satisfactory reasons can be assigned. Prince Charlie was a runner, Macgregor and Camball were lame on the Derby Day, and Petrarch—well, it is impossible to say why Petrarch was only a bad fourth in the Derby of 1876. It certainly does seem beyond a doubt that Chamant, if nothing happens to him between the present time and the last Wednesday in May, must again beat all that finished behind him at Newmarket. No doubt there are other formidable opponents against whom he will have to contend. Pellegrino has something more than a private reputation, and may prove a less disappointing champion for Russley than the disgraced Morier. Rob Roy won his two engagements as a two-year-old in brilliant style, and few horses will receive a closer scrutiny in the Epsom paddock than the fine-looking son of Blair Athol and Columba. If Fontainebleau runs, he will unquestionably be second favourite, and may even press Chamant close for first position; but he may very likely run for the French Derby, which is quite at his mercy, and in that case he will hardly be seen at Epsom. Anyhow, Chamant bids fair to be as formidable in the Derby as he was in the Two Thousand, and the chances that Count de Lagrange has at length found the long-threatened second Gladiateur seem unusually promising.

REVIEWS.

FERNAN CABALLERO.

A MONTH ago, just after Alfonso XII. had passed through Seville on his late progress, and while the town was still gay with decorations and visitors, many of those who had gathered there to welcome the King were saddened by the news that Fernan Caballero, the great woman-novelist of Spain, lay hopelessly ill in the palace of the Alcazar, where many years ago Queen Isabella had made over a suite of apartments to her use. On the 7th of April she died, and her loss is very deeply felt in Spain, where, in spite of the strong party-beliefs and prejudices which mark her books, she was generally and deservedly popular. Not even excepting Trueba, she was the most national and the most Catholic of modern Spanish writers, and the national and Catholic party are naturally loudest in their expressions of regret and admiration. But besides and beyond her *Españolismo* (to use an expressive native word) and her Ultramontanism, she had certain real gifts and qualities of genius which may well make her loss felt even by those in her own country to whom much of her writing was extremely distasteful, and still more by the reading public of other countries, unweaved by the passionate political questions of modern Spain. Her name has long been more or less known in England. It is now, indeed, sixteen years since the *Edinburgh Review* first drew attention to her principal books, and since then we have had other notices of her, while seven or eight of her stories have been translated into English by Lady Wallace, Miss Bethell, and others. It cannot be said, however, that these translations have had any great success, and it may be doubted whether her books can ever produce their full effect except upon a Spanish reader. The greater the foreign reader's knowledge of Spain and Spanish life the better he will be able to appreciate Fernan Caballero; but upon those whose imaginations have never been touched by the present beauty of Andalusian skies or by the past romance of Spanish history she will make very little impression as a novelist pure and simple; while her lack of the higher intellectual facilities, of the philosophical power and breadth to which we are accustomed in other female novelists of the day, will always prevent her taking the highest place as a literary artist. But as a painter of Spanish manners, of the life of rich and poor, town folk and country folk, in sunny Andalusia she is unrivalled, and for that minority of readers who in reading a novel are content to dwell upon conversations, scenes, isolated characters, rather than intricacy of plot or novelty of thought, she will have a perpetual charm. No one has rendered the *sol Andalus*—the lively, witty, proverb-sprinkled talk of the South—as she has. Trueba has rivalled her in landscape-painting, and there is nothing in Caballero more crisply, delicately touched than his Basque orchards and flashing Northern streams; but in the reproduction of the ways, the sarcasm, the chatter of the Spanish peasant or *bourgeois*, she has no equal, and her pages must live as long as the familiar aspects of Spanish life are dear to Spanish people.

Curiously enough this most Spanish of Spanish authors was on her father's side German by birth. Towards the end of the last century the son of a Hamburg merchant was sent out to Cadix to learn business in his father's banking-house in that town. He took root there; became a Catholic; and, after marrying a Spanish lady of high birth, made himself known in other countries as a learned and devoted student of the early literature of the Peninsula. To him we owe an excellent collection of early dramas, Spanish counterparts of *Gambrin* and *Corbois*, besides a book of selections from Spanish poetry in general, the *Floresta de Rimas Antiguas Castellanas*. He became a member of the Spanish Academy, while still retaining close relations with Germany and German scholars. Muller dedicated his *Romancero del Cid* to him; Schack ranked him with Lessing and Schlegel in critical faculty; while, since his death, an interesting memoir of him has been published by Dr. N. Julius, in the German edition of Ticknor's *History of Spanish Literature*. His wife, a member of the Spanish aristocracy, was, says report, an author in her youth, but mainly remarkable after her marriage for her unflinching Catholicism. Their daughter Cecilia Böhl de Faber, born in 1797, inherited her parents' gifts and ways of thinking in an intenser degree. Spain and Catholicism have been throughout the ruling passions of her life. They are the unchanging groundwork of all her books. To them are to be traced, on the one hand, the faithfulness and vigour with which she has drawn Spanish life; together with the atmosphere of grace and charm which pervades all her books, and which we owe to her unflinching love for her subject; on the other hand, her worst literary defects, her over-sentimentalism, her love for making "contingent" points, and her provoking habit of keeping a story waiting while her characters argue against "constitutionalism" or "the new ideas." From her father, however, she received, besides these tendencies, a taste for general reading not common in Spain, while her natural mastery over German admitted her at once to a wider field of culture than is ordinarily accessible to Spanish ladies. Her first novel, *The Alameda Puma*, was written in German and shown to Washington Irving then travelling in Spain, in manuscript. He was struck with the story, and warmly advised the author to go on writing, and to write in Spanish. Her next effort was the *García*, published in the Spanish version.

By the Hon. Augustus Bethell, Esq., M.P., London.

paper in 1851, her first published novel, and unquestionably her greatest book. It brought her at once into immense repute with national and orthodox Spain. As was the case with Trueba, her later books were published at the Queen's expense; she was at one time governess to the Royal children, while ever since her father's death she has occupied the rooms granted her in the Alcazar. To her charm of manner and character both Spaniards and foreigners testify, and from a passage in Lady Herbert's *Impressions of Spain* we get a glimpse of a personal trait which has left its mark in many of her books, notably in the denunciations of bull-fighting which occur in the *Gaviota* and elsewhere. Speaking of a visit to her in Seville, Lady Herbert says:—

Great trials and sorrows have not dimmed the fire of her genius or extinguished one spark of the living charity which extends itself to all that suffer. Her tenderness towards animals, unfortunately a rare virtue in Spain, is one of her marked characteristics. She has lately been trying to establish a Society in Seville for the prevention of cruelty to animals, after the model of the London one, and often told one of our party that she never left her home without praying that she might not see or hear any ill-usage to God's creatures. She is no longer young, but still preserves traces of a beauty which in former years made her the admiration of the Court. Her playfulness and wit, always tempered by a kind thoughtfulness for the feelings of others, and her agreeableness in conversation, seem only to have increased with lengthened experience of people and things. Nothing was pleasanter than to sit in the corner of her little drawing room and hear her pour out anecdote after anecdote of Spanish life and Spanish peculiarities, especially among the poor.

In 1866 the Madrid edition of her works had reached seventeen volumes, some of which are occupied by several short stories, and one by a welcome collection of popular tales and verses. Her more important stories are the *Gaviota*, *La Familia de Alarcada*, *Elin*, *Clemencia*, and *Pobre Dolores*. Of these the *Gaviota* stands easily first. She did not publish it till she was past fifty—a fact worth noting in the statistics of authorship:—so that the book has few, if any, crudities of style, and is marked throughout by the ease of touch and fulness of material which one might expect in the mature work of one who to natural gifts had added a long and close acquaintance with the varied society around her. It is the story of a sentimental young German doctor thrown by chance into the midst of a little Spanish village, where, as ill luck would have it, he falls in love with the exquisite voice and bizarre beauty of a fisherman's daughter, *La Gaviota*. *Gaviota* means properly *sea-gull*, and the nickname, as applied to Marisalada by the fish-boy of the story, points to one of those harsh, angular, unsympathetic natures which, when armed with beauty or some powerful natural gift, seem made for the torture of the most intimately concerned with them. Maria's voice, as she sings the wild monotonous romances in the deserted convent garden, is the first thing about her to impress the young German susceptible alike to music and maidens. He stays three years in the village, and then, in the absence of any more exciting lover, Maria says Yes, and the two are married. But of the capacities of his wife's fierce and passionate nature Stein knows nothing. He had developed her voice and taught her music, for which services Maria repays him with a certain amount of friendliness which Stein takes for love, little knowing how utterly foreign to all the girl's instincts and ways are his moonlight wooings and talk of "the infinite." For three years after their marriage Maria's character remains veiled and half developed, and Stein is simply and ignorantly happy. Then chance and a generous patron, who is struck by Maria's voice, carry them to Seville, and the tragedy of the book begins. Through the kindness of their powerful friend the Duke de Almansa, the husband and wife are introduced to all the best society in Seville, Maria sings in the opera with extraordinary success, and Stein, delighted with Seville, grateful to all who show him kindness, and intoxicated with his wife's triumph, reaches the height of happiness. Meanwhile, one thing only in her new life touches Maria's barren and impassive nature. "How do you like Seville?" says a great Seville lady to her. "Pretty well," replied Maria. "And what do you think of the Cathedral?" "Too large." "And of our beautiful gardens?" "Too small." "Then—what is it you like best?" "The bulls." At the critical moment of the first bull-fight to which the Duke takes his protégée, he turns to watch the effect of the sight upon Maria. For the first time since her arrival in Seville he sees some animation in her face. Stein, sickened by the sight of the maddened animal surrounded by a ring of bleeding horses, endeavours to escape before the final act of the *corrida*, in which the bull, having put his slighter antagonists to flight, is to cope with Pepe Vera, the most famous matador in Seville. But Maria, "all her soul in her eyes," refuses to go. "Am I a nervous girl?" she scornfully asks, "and are you afraid I shall faint?" So Stein slips out alone to a quiet rumble round the sights of Seville. Meanwhile Pepe Vera, the matador, coming according to custom to salute the President of the bull-ring and ask leave to give the final stroke, for the first time perceives Maria sitting by the Duke's side. After a few moments of frantic excitement, the bull, rushing upon the defiant and unmoved matador, receives his death-blow, and the vast multitude breaks into applause:—

Pepe Vera walked quickly across the ring in the midst of those frantic outbursts of passionate admiration, of that unanimous ovation, saluting with his sword to right and left, in token of acknowledgment. A triumph that more than one Roman Emperor would have envied scarcely passed in him either pride or surprise.

The Duke put a purse of gold secretly into Maria's hands, and she, wrapping it in her handkerchief, threw it into the ring. As Pepe Vera bowed his grateful farewell, the glances of his black eyes crossed with those of Maria.

The physical force and beauty of the man, the excitement of the scene, have roused all Maria's dormant passion, and the sequel of the story is easy to foresee. One night after the opera Pepe picks up Maria's handkerchief, which she purposely lets fall, and at midnight we have the characteristic Spanish rendezvous in the dark street "where an officious hand had put out all the lights"—the powerful figure of the matador leaning against the wall, the veiled form behind the *reja* or window-grating—while Stein sleeps, happy in his wife's successes. The final catastrophe, and the true and powerful irony of Maria's ultimate fortunes, are managed with a skill and self-control in which many of Caballero's other novels are strikingly wanting. We have no wholesale death-scene as in *The Alarcada Family*, where ruin and destruction overtake a whole household down to the old watchdog and the orange-tree in the patio. The story ends as such a story would naturally end in real life, and the last impression is the cry of the teasing dwarf who first gave the nickname:—"Gaviota fuides, Gaviota eres, Gaviota serás!" In spite of Stein's broken heart, and the horror of Pepe Vera's last bull-fight, the book is far from being pure tragedy, and its ugly story is interwoven with the most lifelike descriptions of Andalusian country folk, their festivals, their beliefs, their ignorance, and their natural subtlety and cleverness, together with pictures soberly and exquisitely sketched—save where every now and then an outbreak of Ultramontanist spoils the proportion of the whole—of the dry sun-scorched Andalusian landscape, with the grey and blue greens of its figs and olives, its vast convents from which the Padres have departed, its belt of desolate sea-marshes, and its perpetual alternation of garden and desert, bloom and barrenness. In the accounts of Seville society, too long perhaps and too slenderly connected with the main action of the story, the English reader will find constant amusement in one or two cleverly-drawn caricatures of his own countrymen. Sir John Burnwood, the rich owner of coal-mines, who comes to Seville determined to buy up the Alcazar and transfer it stone by stone to his estate in England, and who is furious because the Chapter refuses to sell him the silver dish in which the Moorish king presented the keys of the city to its conqueror, St. Ferdinand; and Major Fly, with his qualities as a bore, his propensity for drawing-room boxing, and his belief in his omnipotence over the fair sex, are grotesque indeed, but not without a certain truth of foundation. The ordinary Spanish countrywoman's idea of England is well given in a passage in *The Alarcada Family*. A returned soldier from the War of Independence has been giving his family a hearsay account of England as a country of snowdrifts and heretics, of black bread and altarless churches, where there are no olives and the sun never shines, and old *Tia Maria* breaks out into exclamations of passionate rejoicing over her own brighter fate:—"Oh! my sun! Oh! my white bread, my church, my Holy Mother, my faith, my Host and my country! Happy a thousand times I who was born in her and by Divine mercy shall die in her! Thanks be to God thou wast never in that land of heretics, my son!"

The *Gaviota* is perhaps the only one of Fernan Caballero's novels which possesses a consistent and striking plot. But the reader will find excellent character-drawing and delightful scenes in all of them. The great landowner of the old school in *Clemencia*, "with his desolate overgrown house where life goes on" always the same, like the Pater Noster and the Ave Maria; Padre Nolasco, ignorant, kind-hearted, and shrewd in *Pobre Dolores*; the *dévoté* and uncharitably Elin, and the children who make the pretty chattering background of every story and rival Trueba's children in their wealth of rhymes and legends—all are drawn with the same clear outline, the same tender and sympathetic touch. The two main impressions left by the perusal of these interesting and remarkable books on the mind of the foreigner are perhaps, first of all, an impression of the vast wealth of poetical material with which legendary Catholicism has endowed popular life in Spain; and, secondly, an impression of peculiar subtlety and shrewdness in the Spanish mind, summed up in a recently quoted saying of Schopenhauer's, where he speaks of Balthasar Gracian as "a son of the subtlety of all nations." In spite of all the contradictory testimonies of foreigners and natives; in spite of the demoralization of the towns, of the ignorance and the fierce passions of the peasantry; in spite of all the disturbing effects which the inevitable *Zeitgeist* has brought into Spanish society steeped socially and religiously in the beliefs of the middle ages, the poetry and the subtlety are there. The Spanish people, far as they have lagged behind in the European march, are still rich in head and heart, and nowhere is this made plainer than in the work, at once blind and clear-sighted, of the great writer just passed away.

DREW'S NORTHERN BARRIER OF INDIA.*

MR. DREW'S present occupation and the proximity of classical studies may have reminded him of the familiar Greek proverb about a big book. His present modest volume contains nearly everything likely to interest the general reader who wants to know something of Kashmir and its dependencies. For details, and especially for geological data, the student is referred to the older and more bulky volume by the same author which we

* *The Northern Barrier of India: a Popular Account of the Jummoo and Kashmir Territories*. By Frederic Drew, Associate of the Royal School of Mines; Assistant-Master of Eton College; formerly of the Maharaja of Kashmir's Service. With Map and Illustrations. London: Edward Stanford. 1877.

reviewed in these pages in October 1875. The result is that we have a much more convenient and portable book than the original work, and tourists who imagine that Kashmir is only worth a visit for beauty of scenery and abundance of game will find a good deal that is worth their consideration if they want to know about its population, climate, language, and ethnology. Mr. Drew does well to remind us that the extent of this dependency, which was practically set up as a separate kingdom by Lord Hardinge in 1846, is equal to England and Wales put together. A considerable portion of it is uninhabited. Some parts are inaccessible; in others the villagers are as secluded during most of the year as those of the loneliest Swiss canton; while, as a contrast, certain well-known tracts present a picturesque combination of wood, water, hill, and valley which hardly any other country in the world can equal. There is probably, too, no other spot in which, as the author shows, three great religions come into such immediate contact. From a range of mountains lying to the east of Srinuggur you may go west through countries occupied by Mohammedans only, as far as Constantinople; east through the land of Buddhists to the Yellow Sea; and south amongst Hindus as far as Cape Comorin. Scarcely less remarkable are the distinctions and subdivisions of races. Out of eight, five are Aryan and three Tibetan. But it is curious that the Baltis, or inhabitants of Baltistan, are Tibetans by race and Mussulmans by conversion. Of the five Aryan, three, the Chibhalis, Kashmiris, and Dards are Mohammedans, while Dogras and Paharis are Hindus. Modern tourists are very apt to confound and overlook these fundamental points.

Jummoo, the old, and still the winter, capital, which is only about twelve hundred feet above the sea-level, has been the seat of a Hindoo dynasty for more than a thousand years, and Sanskrit scholars are well aware of the existence of a work called the *Raja Tarangini*, which purports to be a history of the Kings of Kashmir. It contains, we have every reason to believe, a large proportion of tradition and myths. The present races of Hindus are either Dogras or Paharis, the former being divided, as in other parts of India, into Brahmans, Rajputs, writers, shopkeepers, barbers, and others, and two or three low castes. Here Mr. Drew makes special note of a certain caste called *Thakur*, adding quite correctly that this term, with a very slight difference in pronunciation, does not in the plains designate a caste at all, but is rather in the nature of a honorific addition. A Thakur in Central and Upper India is a Rajput. In Bengal proper it means a Brahmin, or at times a father or an ancestor. It is not very easy to make out in what particulars the Paharis, the other Hindu race, differ from the Dogras, except that the former are genuine mountaineers, and that the Dogras seem to draw some line between them. But whoever has studied the subject of caste in any part of India is well aware that its ramifications are endless, its canons elastic and perplexing, and its definitions arbitrary. Sometimes a new subdivision took its rise from the error of a high-caste damsel who encouraged a low-born lover, some four or five centuries ago; sometimes it was due to the pressure of a despot who acted from caprice or settled policy; sometimes it sprang from rivalry or persecution. But one main fact is patent in all these inquiries. Natives, as a rule, know little and care less about the limits and observances of any caste but their own. With rare exceptions, all such particulars are collected by the patient industry of inquirers like Mr. Drew. Why indeed should a native, especially one of high caste, trouble himself with details about classes with whom he cannot intermarry, at whose table he will not sit, and into whose carriage or cart, until the introduction of railways summarily put an end to some of the tyranny of exclusiveness, he either dare not or will not enter? It is rare to meet a Brahmin who can tell accurately the subdivisions of the great Kayast or writer caste of Bengal. As in other parts of India, Mohammedans in Kashmir keep up subdivisions of castes; but they are obviously the descendants of Hindus converted under the green flag and the conquering sword. Some of the successors of these weak brethren still have a family idol, and formerly they were allowed to marry Hindu women of their original caste. Another fact noticed is that all Kashmir Brahmans, whatever their occupation—copyists, tailors, and cloth-sellers—retain the title of "Pandit," an appellation generally bestowed in other parts of India on Hindus learned in the Shastras. The first native who ever rose to the position of a Judge of a High Court in India was a Kashmiri Brahman with the aforesaid title, whose family, however, had descended, centuries back, first into Oudh, and afterwards into Lower Bengal. Mr. Drew adds some interesting particulars in this volume about language and its varieties. The common Urdu or Hindustani will carry most travellers through the country, while Kashmiri itself is difficult and uninviting. All the chapters on race and their peculiarities will be found attractive to scholars, and not without their value to mere summer tourists who go to Kashmir for scenery, health, and recreation, or sport. But we prefer to the descriptions of wooded lakes and lovely villages those of the outlying provinces, as they carry us very far away from India and its plains, and from its girdle of hills and forests. Skardu, Gilgit, and Ladakh, for instance, seem to differ more from Jummoo or Srinuggur than these cities do from the populous bazaars of the Doab. Gilgit is in reality only 130 miles from Srinuggur, but the traveller takes nearly twenty-two days to get there, and goes over 230 miles of road. Readers who have a strong digestion for atrocities will here find an account of the doings of a bloodthirsty despot named Gaur Rahman, a Mohammedan who held his own against the Sikhs, both before and after the campaigns of the Sutlej and the

Punjab. This worthy personage, who was neither slain in battle nor assassinated by oppressed subjects, but died peacefully in his own capital, was the father of Mir Wali of Chitral, who caused Lieutenant Hayward to be murdered in 1870.

Mr. Drew dwells a good deal on the climate and characteristics of the dependencies which he describes as lying at the back of Kashmir; and they are more worthy of attention than the desultory campaigns or the intrigues of a parcel of ruffians. It may be said generally that all these parts of the dominions of the Maharaja are, in point of revenue and resources, worth very little to any one. The climate is dry, bracing, and healthy; but the winter is long and tedious, while fuel is scarce, and the population, with adherence to the Scotch proverb, "The clartier the cosier," rely on a coating of dirt and on contiguity in crowded tenements to sustain life and to keep out the cold. Cultivation is carried on in small plots near rivers, or in terraces to which water is conveyed by troughs. Fruit-trees, however, do occasionally flourish in sheltered or favoured spots, though the mountains for miles are bare of either trees or vegetation. Women here enjoy complete social liberty, take part in the labours of the male population, water the fields, and carry heavy burdens; and we are not surprised to hear that where economy is rendered imperative by the poverty of the land, the vile custom of polyandry flourishes. The inhabitants of Ladakh seem to bear their lot with marvellous equanimity. They are mainly agriculturists, and families cultivate in common a small plot of land. The crops are peas, barley, a coarse variety of the same kind called "grim," and also wheat. We are surprised to find that this latter grain can ripen at an elevation of more than 11,000 feet. The food of the population is meal of the aforesaid "grim" made into dough, or else into soup. Sometimes they are lucky enough to add a little meat or tea. They drink a liquid described as a "cross between home-brewed beer and farmhouse cider," and can distil a spirit like whisky, though it is prohibited by law. They have a cruel custom of killing animals by suffocation, and an unpleasant one of draining the victim's blood into their broth and warming it up for the table. With all this, they are spoken of as hardy, cheerful, and contented.

The utmost limit of barrenness and desolation seems to be reached in Zaskar, regarding which Mr. Andrew Wilson has told us a good deal in his *Abode of Snow*. It is not very easy to imagine a country, short of Iceland or Kamchatka, out of which so little is to be got. The author could only make out a list of forty-three villages, which, at ten or twelve houses apiece, gives a return of 2,500 souls. The Government revenue is only 200*l.*, and the exports and imports of salt, rice, butter, honey, skins, with some barley and wool, are insignificant, and are carried over passes dangerous to ponies, and occasionally to pedestrians. Some of the higher valleys of Ladakh are worse off than Zaskar. Ice cakes the pools in the month of August; for, though the sun's rays are powerful and the mid-day air warm, the afternoon is unpleasantly windy and the nights bitter. Mr. Drew here followed the course of the Indus till he got along an alluvial plain where he could almost see the commencement of the Chinese territory; and his experiences fully warrant him in giving up one chapter to illustrate the difficulties of the traveller who wishes to get to Eastern Turkestan. Sometimes fuel is not to be had; at other spots water fails. At one place you cannot get food for the baggage-animals, and at another you run the risk of losing them from exposure, hardship, or a fall down precipices. It required all the resources of a liberal Government to organize an expedition that could carry its own supplies over such a route, even when the object was merely commerce; and no one will dispute the conclusion of the author that, against a hostile invader, the ridges which separate Kashmir Proper from its outlying provinces, backed by the Mustagh or Karakorum mountains, form a natural defence which artillery could not traverse, and where large bodies of men would be starved. It may be not unnecessary to remind readers that, as Kashmir is a political creation of our own, its ruler, though internally independent, is tied and fettered by a variety of stipulations in everything that relates to external policy. He pays, or did pay, an annual tribute of the finest shawls that ever left a loom, and acknowledges our supremacy. He is bound to refer to our arbitration in disputes with any neighbours. He may not take into his service any Englishman, American, or foreigner without the consent of the Viceroy. He must place all his forces at our disposal if we ever think it necessary to act within or near his territories; and he can call on us to protect him against all external foes. Moreover, he has received permission to adopt a son, on failure of heirs of the body, and such adoption will be ratified by the British Government so long as the ruler observes his engagements and is "loyal to the Crown." In short, his position is different in all essentials from that claimed by and conceded to the Amir of Kabul on the one hand and the Maharaja of Nepal on the other. It was not out of mere form, but from deep sincerity, that the late Gholab Sing literally caught the drags of Lord Dalhousie in both hands at Wuzerabad, and cried aloud, "Thus I grasp the skirts of the British Government, and I will never let go my hold." The too brief account which Mr. Drew gives of the means by which that ruler consolidated his power, reduced his chiefs to obedience, and generally employed diplomacy in preference to force, bears out the conclusions of the best Indian authorities. We could have wished that this part of the work had been enlarged and illustrated by more anecdotes. But, as an account of the people and climate, it has decided

of taste which allowed the anonymous writer to compose and publish such a book at all. Some of the portraits are not only drawn from the life, but from a close observation of the daily habits and conversation of the subjects. Dr. Jenkinson, for example, makes one wonder whether the author of the picture can be any other than one of the clever failures who from time to time discredit the institution over which Dr. Jenkinson's prototype presides. There is a bitterness of personal spite in the whole drawing of this character which forbids its sinking into burlesque; the whole man is given as he would appear to a sworn enemy resolved to show him at his worst. But this kind of caricature is much more hurtful to the artist than to the victim, because it demands, to be carried out well, an utter blindness to the good qualities of the man so described; and, in the case of one whose life is noble, it is a poor and degrading task to hold up the picture with the shading cleverly varied so as to represent the nobleness as all rotten, the teaching as all cajolery. The writer to whom we have already compared this anonymous one escaped dangers of this sort, for Peacock was not ill-natured. He would have been the last person in the world to "revile his father Parmenides"; and he would have thought this travesty of Dr. Jenkinson to be a case of attempted literary parricide, to be punished *more majorum*.

JACOX'S SHAKSPEARE DIVERSIONS.*

MR. JACOX is still an interesting example of periodicity in the literary malady. Two years ago we remarked that he accumulated promiscuous reading so rapidly that relief was necessary every second year. His eye seems to fall on no scrap of printed matter that he does not immediately copy out and consign to a commonplace book or some other lumber-room. Every second spring or autumn his receptacles will hold no more, and he discharges his knowledge on the public. What examinations are to the undergraduate, publication is to Mr. Jacox. The student reading hard for honours at last becomes surcharged, and welcomes the day when he is obliged to put out all he knows on paper, after which he makes haste to forget the events in the Peloponnesian War and his analysis of the *Republic* of Plato. So it is to be hoped that Mr. Jacox's MS. extracts pass from his pigeon-holes to his wastepaper-basket after each new volume. In 1871 he got rid of a great deal of stuff which was only perilous in quantity; in 1873 a book called *At Nightfall and Midnight* gave grateful relief; in 1875 a first series of *Shakspeare Diversions* left him lighter and easier. He knew, however, that 1877 would find him once more an author, and he comes up to time with a punctuality which cannot be too much admired. One might even make a guess as to the problem that troubled Mrs. Harris, and tell Mr. Jacox his very number; but it is better to "seek not to anticipate." Sufficient for the day are the *Shakspeare Diversions* thereof, though it is natural to expect an addition to the Jacox library in 1879.

It is not very easy to determine whether Mr. Jacox first reads his Shakspeare, and then selects passages from books and reviews in which words used by Shakspeare's characters occur, or whether he keeps vast notes alphabetically arranged, and then attaches them in an arbitrary way to Hamlet and to Dogberry. The method of an artist is rarely to be detected with certainty, and we cannot be quite sure that Mr. Jacox never reads a book without having large blank slips of paper before him, in the manner of index-makers. It seems difficult to fancy that he never takes up the *Saturday Review* without his apparatus for note-making; but his frequent quotations from this journal make it seem probable that he studies in this earnest fashion. Scraps from novels too, however feeble and forgotten, he treasures carefully, and he even goes so far as to hoard snippets from reviews of stories which oblivion has claimed long ago. "A *Saturday Reviewer* objects to such a story as Mr. Strickland's *Abbeys and Attics*," he says, as if this were a fact which any one but the author of *Abbeys and Attics* was likely to consider worthy of record. He thinks an illustration from *No Name*, or *The Rock Ahead*, or one of Mr. Charles Reade's romances, or the last novel from the circulating library, as valuable as a coincidence of thought in Sophocles or Æschylus. Sophocles indeed, if we may trust the index, is used to illustrate Shakspeare but twice, while Mr. Edmund Yates is dragged in five times. Æschylus is never mentioned at all, or, if he is, the index is at fault; whereas Miss Braddon is brought into relation with Shakspeare pretty frequently. Yet many critics hold that Shakspeare had more in common with the glory of the Attic stage than even with the authors of *Black Sheep* and *Aurora Floyd*. Thus it is small comfort to us that Mr. Jacox refers to this journal no less than twelve times. With Scott, Schiller, and Schlegel, we are among his favourite authors, and here a certain suspicion creeps in. Making a book by aid of Shakspeare, Mr. Jacox would naturally turn most frequently to the receptacle labelled S. in his literary storehouse. This may explain a liking for which, in an eager student of weak novels, we find it difficult to account.

Mr. Jacox's method, like that of Herodotus, "seeks for digressions." Thus, when the Watch ask Dogberry "How if he will not stand?" Mr. Jacox pours out all the examples he has collected of what he calls "contingent queries." In one page he brings together Maggie Tulliver, Kant, Titus Annius, Swift, and Harrington, and of course he does not forget Dr. Johnson in

the tower with the baby. This is rather too good an example of his style, for there may be people who feel as if they were learning something and improving their minds when they are referred to Pantarock. But when a whole page is devoted to a passage out of *Little Dorrit*, even the humblest student of Mr. Jacox must guess that he is being imposed upon. He may not be one of the "old-fashioned people" who read Plutarch, people about whose existence Mr. Jacox is doubtful, but he can hardly be grateful for the research which dwells fondly on *Little Dorrit* and *Little Nell*. In the same way the humble reader for whom we suppose Mr. Jacox to write may need to be told that "not Homer, but one of the Cyclic poets derided by Horace, began an account of the Trojan war with the nativity of Helen, or the story of Ieda and the eggs." But even the very lowliest reader must feel that he need not go to Mr. Jacox for intelligence about Mr. Undecimus Scott of the *Three Clerks*. A great deal of writing of this age merely sets forth things that people used to think for themselves, but did not take the trouble to say. Mr. Jacox reprints quantities of trivial matter that other readers might be at some trouble to forget. We do not want to remember anything at all about Mrs. Wilfer and "the old women in Mrs. Whitney's *Hitherto*." They may have helped to pass an idle hour, but their resurrection in a volume of *Shakspeare Diversions* is distressing. One can bear being reminded of, or instructed about, Tallemant des Réaux and Mlle. de Scudéry, but who can be the better for the repetition of trash like this?—

"I'll eat my head," is the contingent promise, ever and anon renewed of Mr. Grimwig, should his intubility be found at fault. To Mr. Brownlow's hearty championship of the boy Oliver, "I'll answer for his truth with my life!" the other old gentleman promptly responds, "And I for his falsehood with my head!" "If ever that boy returns [as pledged] to this house, sir, I'll eat my head!" "If there's a hincut in the omelette I'll heat in!" pledges himself Mr. Charles Rode's detective in *Hard Cash*.

To illustrate Mr. Jacox as Mr. Jacox illustrates Shakspeare, it is of Thackeray's Captain Smulph that we are reminded by this quotation from Mrs. Augustus Hare:—"Reginald Heber and Mr. Stow are both excellent actors, and we acted a French proverb one night, and the 'Children in the Wood' another . . . and very amusing it was."

In a volume of more than four hundred pages Mr. Jacox has of course collected some anecdotes which are not unworthy of being repeated. Among people who have been written down asses, as Dogberry wished to be, he notes the *Asses* who accompanied the French expedition to Egypt:—"Napoleon in Egypt treated the philosophers who accompanied this expedition—the 'scientific characters' Alison styles them—on a strictly equal footing with the asses wherever the enemy appeared; for the rule was, in that contingency, to huddle together *savans* and asses in the centre as the only safe place, and no sooner, according to Las Casas, were the Mameluke horse descried than the word was given, 'Form square; artillery to the angles; asses and *savans* to the centre!'" In the same place Mr. Jacox mentions a favourite joke of the Turks. In Cyprus, in 1823, "not content with stabling their horses in the churches, the Ottomans actually saddled and bridled some of the unhappy ecclesiastics, and forcing them to go on all fours, rode on them in derision, and kept them going till they, not were ready to, but *did*, drop down dead of fatigue." With that tenacious clinging to a good thing which the Russians showed when they reported the loss of "one Cossack" in the first bulletin of the present struggle, as in many bulletins of the Crimean War, the Turks have revised their playful trick of saddling Christians. Even in 1823 the humour of the sport was four centuries old. Villon prays that the *esquemas* of France may be sold to the Grand Turk, and may be put by him into harness:—

Ou au Grand-Turc vendra argent contant
Pour estre mis au harnois comme un tor.

A more disagreeable page contains all the instances of violent sickness after the eating of strange food which Mr. Jacox can remember. He has not enlarged on a text which we suggested to him two years ago, but he has filled two pages with footnotes full of scarcely more agreeable matter. "Strange facts and allusions, half spiritual, half psychological," may be suggested by the cannibalism attributed to Richard I. in an old romance; but this time Mr. Jacox does not "make up a monstrous chapter of emptied eye-sockets." But it would be possible to illustrate Shakspeare without collecting examples of "these violent heavings—as of one that would be rid of the abomination too wittingly gulped down." To turn to a less repulsive theme, we cannot agree with Mr. Jacox in holding that "the resemblance to waxwork is probably the explanation and justification of objections to coloured statuary." We have never seen good waxwork, except perhaps in the lovely head by Raffaello. And we have never seen coloured statuary worthy of the name. There was nothing to dislike in the coloured reliefs found at Myra by Sir Charles Fellows, and Greek art could no doubt have produced a Hermione as little offensive to taste as that of Shakspeare's artist.

It is difficult to give a consecutive account of a book which is all scraps. We have to complain that the scraps are, as a rule, not fresh, and that Mr. Jacox has not seasoned them with much wit of his own. Montaigne's flow of ancient and modern instances is never wearisome, partly because the anecdotes are not within every one's knowledge, partly, of course, because of the pellucid wisdom and wit in which the fragments of the older world are presented. It needs something more than a commonplace book and industry to make a modern essayist of the anecdotal class. Humour and

* *Shakspeare Diversions*. Second Series. By E. Jacox, B.A. London: Daldy, Isbister, & Co. 1877.

knowledge of life as well as of books—knowledge of rare books too, and not merely of works within the reach of every reader—are all needed by the writer who would illustrate Shakspeare. We do not mean to give the impression that Mr. Jacox has no pages out of which some information and some amusement may be gained. The chapters on blushing and on stage tears contain some really respectable anecdotes. But many weary pages, full of trivial quotations and of familiar commonplaces, must be turned over to find one or two grains of more valuable matter. Mr. Jacox does not even spare us Carker's teeth; and, if Carker's teeth be forgiven in gratitude for a good thing of Chaucer's, resentment is roused again by the introduction of "Messrs. Prodders and Twenk, in a story of modern life." In short, bad literature is only made worse by being brought into close contrast with the supreme poetry which Mr. Jacox mixes up with fifth-rate novels and old magazine articles. A lover of Shakspeare will be annoyed at having all this anecdotal confusion with his memories of the most melancholy or humorous passages, just as a lover of Homer is vexed by the "detestable jig" of Dr. Maginn's Homeric ballads.

Mr. Jacox writes, of course, not for lovers of Shakspeare, but for students who like to read by snatches works that demand no thought. In 1879 he may possibly find some peg to hang his stories on less illustrious than Shakspeare. "Tupper Diversions," for example, would be rather a good title, and Mr. Jacox could embroider on his author's discourse without fear of disguising his native merits.

COPE'S HISTORY OF THE RIFLE BRIGADE.*

HISTORICAL memoirs of most of our regiments have been published during the last few years, and it is perhaps rather surprising that no record of the famous Rifle Brigade should before this have been given to the world. However, if this well-written memoir is late in the field, it is more complete and more readable than the generality of such publications. The history of the services of the Rifle Brigade is in fact the history of British military operations since the beginning of the century, and this record, like the excellent one lately published of the Grenadier Guards, will command an interest extending far beyond the circle merely of persons connected with the regiment.

This distinguished regiment took its rise in an experimental corps of riflemen formed in the year 1800 from a chosen line regiment, each of which furnished in the first instance a detachment of thirty-four rank and file, "all of them being such men as appear most capable of the performance of the duty of riflemen. These non-commissioned officers and men are not to be considered as being drafted from their regiments, but merely detached for the purpose above recited; they will continue to be borne on the strength of their regiments, and will be clothed by their respective colonels." The detachments so selected were assembled in the first instance at Horsham in Sussex, altogether some four hundred and fifty strong. The first call for active service was made in the summer of the same year, when three companies were sent as part of Pulteney's expedition to Ferrol. This enterprise was as feebly conceived and carried out as were most of our military operations at that time; but the young corps, although not yet a separate organization, achieved some distinction, being the first body to land and to be engaged with the enemy. The actual formation of the regiment as a permanent body took place in the following winter, the officers who had been doing duty with the experimental corps being now permanently transferred to it. The late Sir Charles Napier joined it soon afterwards as a second lieutenant. The first service of the new regiment was with the expedition to Copenhagen, the corps being distributed among the different ships of Nelson's squadron. In 1802 the "Rifle Corps," as it had so far been called, was numbered as the 95th of the Line, still retaining its uniform and special equipment; and in 1803 a wing of the regiment was sent to the camp of exercise at Shorncliffe, "the marvellous results of which have been so truly and eloquently described by Sir William Napier; and here they first met and were brigaded with the 43rd and 52nd, in united action with whom, as the light division, they were afterwards to become so famous."

A second battalion of the 95th was raised in 1805, the nucleus being supplied from the 1st, and the bulk of the rank and file obtained by volunteers from the militia—the great recruiting-ground in those days for the line. A few months later a portion of the second battalion was sent on the unfortunate La Plata expedition, and, being joined shortly afterwards by the first battalion, took an active and gallant share in that abortive campaign, one of the many similar enterprises in which the Governments of those days were wont to dissipate the strength of the empire. Meanwhile, the remainder of the battalions—for, just as there is now a conservative party in the army who cannot see that our existing regiments are too small as the unit of organization, so in those days even a single battalion must needs be split up into detachments—was employed in Lord Cathcart's expedition of 1807 to Denmark, and there first served under the immediate command of the great chief "in the advance under whose eye they were so often to fight, and whose

measured praise they were so often to receive." Sir Arthur Wellesley, then Major-General, fresh from his wonderful Indian campaigns, the extraordinary merits of which were at that time certainly not generally understood or appreciated. Returning to England from Denmark in November 1807, four companies of the second battalion embarked for Portugal in June of the following year, and formed part of the force which opened the Peninsula War with the landing in Mondego Bay; they were the first to be engaged with the French, Lieutenant Bunbury of the 95th, who was killed in a skirmish two days before the battle of Roleia, being the first British officer who fell in that great struggle. Shortly after the Convention of Cintra, two companies of the first battalion—for the Administration remained true to their principle of cutting up our small army into as many detachments as possible—joined the expeditionary force; and eventually, when Sir John Moore took command of the army in Spain, in the latter end of 1808, both battalions of the 95th formed a part of it, sharing in the advance into Spain and the subsequent disastrous retreat, the second battalion, which was brigaded with the 43rd and 52nd under Crawford, retiring on Vigo, and the first battalion with the main army under Moore upon Corunna, where it took a leading part in the well-fought battle which enabled the English to leave the country with honour. The first battalion acted as rear-guard on the night of the battle, and was the last regiment to leave the field for the town of Corunna; scarcely had it reached its ship when the enemy made his appearance, with several guns, on the heights commanding the Bay, from which he opened a fire on all the vessels in the Bay. The battalion lost in this retreat nearly one hundred and forty men, killed or prisoners, and the condition of the survivors and unwounded was deplorable; "their clothing was not only tattered and in rags, but in such a state of filth, and so infested with vermin, that it had to be all burnt."

The two battalions, now stationed at Hythe, were ordered to be completed to a strength of a thousand men each, and so popular was the regiment that not only were the deficiencies almost at once made good by volunteers from the militia, but more than a thousand volunteers presented themselves beyond the numbers required. The Government thereon very wisely resolved to add a third battalion. And it may serve somewhat to reassure us, when comparing the means apparently available of increasing our army to war strength, from the microscopic reserves now on the muster roll, with the huge conscriptions of other nations, to look back on the days of the Peninsula War, and remember what an inexhaustible reserve the militia proved to be. True, the labour market was then overstocked and badly paid; but the army was even then less inviting as compared with civil employment than it is now. What made the army so readily sought by the militia was the prospect of excitement which its service offered, and it seems reasonable to assume that the rate of recruiting which goes on in times of peace and prosperity is no index of what would happen in the event of our being again engaged in a great war. England, with its comparatively small population, had even then a large army. The army employed in Spain and Portugal was small, but that was because the available forces were frittered away in all sorts of foolish diversions, instead of being concentrated on the critical point.

To return to the Rifle Brigade, or, as it was then, the 95th. When the expedition of 1809 was sent to the Tagus under Sir Arthur Wellesley, the first battalion of the 95th formed part of the force, and on landing was definitively formed with the 43rd and 52nd into the Light Brigade, which fought in the van throughout the war, and probably carried discipline and courage higher than has ever been known before or since in the British army. The fact is that the British army has hardly ever had sufficient experience of campaigning to reach the highest standard of soldier-ship. For fighting a pitched battle raw troops which have never been under fire, if well drilled and well led, are probably as good as any; many successful great battles have been won with such material; but after the first start troops are apt to "go off," as the phrase is, especially if they have been severely punished or mishandled. Then, too, at the beginning of a war there is usually a demoralizing effect produced by the losses from sickness which always attend the change from a state of peace to life in camp with all its new conditions. But when the sickly men and the incompetent officers with which a young army is weighted are got rid of, and the seasoned residue remains, then a degree of fighting power can be developed such as English wars seldom give the opportunity for. Such troops were Frederick the Great's at the end of the Seven Years' War, and such was the Light Division in the Peninsula. Hitherto the experience of the English army had been mainly confined to desultory, ill-planned expeditions; when, after being cooped up for months on crowded transports, the troops were landed in the worst possible state for encountering the fatigue of a campaign, to fight a battle perhaps and re-embark, or, if ill fortune tempted a more prolonged occupation of the shore, to melt away under the ravages of the diseases which will certainly attack troops under such conditions. But now the circumstances were all favourable for the formation of the highest class of soldier. To say nothing of the army being commanded by Wellington, the Light Division was always thoroughly well handled; the subordinate officers were exceptionally good; and although the Light Division was not engaged any more than the rest of the army in a great number of pitched battles—these events occurring in the Peninsula War only once or twice a year—they were constantly engaged with the enemy; always getting the better of their antagonists in these combats, and, what

* *The History of the Rifle Brigade, formerly the 95th.* By Sir William H. Cope, Bart., late Lieutenant Rifle Brigade. London: Chatto & Windus, 1877.

is an important element in the matter, seldom getting severely handled themselves. This explains how a body of men may become at last practically invulnerable. With most armies the general who leads them into action will always have misgivings how the day will go; but we may doubt if the commander of the Light Division ever had any qualms of this sort; he must have been used to take it for granted that the division would be certain to perform whatever it was called on to do. Between troops of this sort and the best troops which have not had the same seasoning there is the same sort of difference that there is between a trained hunter who his rider knows will never make a mistake, and the young colt, full of courage perhaps, but whose behaviour at each fence must be matter of doubt till the fence is cleared. It may be remarked, by the way, that the hardest fighting in the early part of the war was not sustained by the battalions serving in the Light Division, but by the third battalion, raised only in 1809, at Rossa in the following year. The greatest loss incurred on any one occasion was at the storming of Badajos, when the two battalions of only six companies each lost about three hundred men; and one cannot but feel that, in using the late Light Division for this service, Wellington may have made a mistake, although not of the same kind as the blunder perpetrated in the abortive assaults delivered at Sebastopol. In the latter case the assaults were planned to fail, from the blunder of employing regiments already used up, which had their ranks full of recruits, and had not had the advantage of that campaigning in the open field which is wanted to brace up the nerves of an army after a long siege, while the troops which had suffered least were kept idly in reserve. At Badajos, on the other hand, Wellington used up his best troops—troops too good for such work, if one may say so, whose peculiar qualities and experience could not be replaced. But the heaviest loss incurred on any one occasion by the regiment during the whole war was at Waterloo. There were present the whole of the first and second battalions, but attached to different divisions, and two companies of the third, or fourteen companies altogether, which lost over four hundred killed and wounded, or about a third of their total strength. It was in the following year that the designation of the regiment was changed to its present one, the Rifle Brigade.

This distinguished corps has already been cited as an illustration of the fact contended for by the Reorganization Committee, that regiments attach much more value to honorary distinctions than to numbers. Up to the year 1816 the name of Rifle Brigade, with which we are all now so familiar, carried no significance with it, and the fame of the Rifle Brigade emphatically rests on its deeds as the 95th, for, except in the Crimea, it has not had very much active service. Since its change of name until the time of the Mutiny the Rifle Brigade was exempted from any tour of duty in India, the great battle-field of the British army since the peace of 1815, and it did not arrive in India till the first pressure of the Mutiny had been got under. And the history of the regiment exemplifies still more strongly the argument contended for by the Committee, that no sentimental feeling need stand in the way of their proposal for amalgamating the different regiments of the line. For, when we speak of the Rifle Brigade, we are speaking of what was really three, and is now four, separate regiments, the portions of which are serving usually in different parts of the world. While one battalion was gaining a name for the whole regiment in the Light Division, the other was rotting at Walcheren. Two battalions out of four took part in the suppression of the Indian Mutiny, and one battalion out of four represented the regiment in the Ashantee expedition. Yet no one discovers any impropriety in saying that the Rifle Brigade served in all these campaigns; and the regiment collectively gains the credit attaching to the conduct of the part which represents it on these different occasions. And it may be confidently expected that, as soon as the coming amalgamation of the other regiments by pairs is carried out, the coupled regiments will appropriate without any dissatisfaction or loss of dignity the distinctions and traditions of the twin battalions with which they are respectively associated.

BRYAN WALLER PROCTER.*

THOSE who may have expected to find in this volume anything like an adequate record of Mr. Procter's own life and character will be certainly disappointed, perhaps seriously disappointed. The editor has carried diffidence to an extreme which is itself, in a work of this kind, a graver defect than any that he was likely to fall into by taking a less narrow view of his functions. As it is, the chapters of biography he has contributed to the volume are too meagre to stand by themselves, and too much for a mere introduction to what follows them. The records made by Barry Cornwall of his contemporaries are in themselves interesting, and would have been doubly welcome if they had seen the light by way of appendix to a really satisfactory biography. We must be content, however, to take them as we find them; we can only regret that the book has been brought out in such a manner as not only not to supply the want of a full and worthy treatment

of its subject, but to stand in the way of such treatment being supplied hereafter.

The fragment of autobiography now published is broken off at an early age. We learn from it some curious details of Mr. Procter's tastes and acquirements in boyhood. Shakespeare was made known to him in an unusual fashion; his tutor was a servant, a woman who had known better days and received a good education. At eighteen he fell in love, or rather persuaded himself to do so, with a certain deliberation, "as a step in philosophy." Mr. Procter's own record ends with the beginning of his literary work in London. He presents an almost singular instance of a man destined for a learned profession, drawn off from it by a strong bent for letters and poetry, justified in his literary ventures by success of a most brilliant kind, and then, almost before the prime of life, and at the very height of public favour, abandoning the field in which his conquests seemed only begun, reverting to solid professional work with positive eagerness, and finding in it a new source of enjoyment. The law is commonly supposed to be a jealous taskmistress, and to show no favour to truants; there is a well-known anecdote or legend about Fearn's burning all his miscellaneous books, for which he reaped his reward in the fame of having devoted his life, as Lord Macaulay has said, to the barbarous puzzle of Contingent Remainders. With Mr. Procter it was otherwise. He became a prosperous lawyer, but kept his books and the friends he had made by and among them, and did not even wholly cease to write poetry.

Without dwelling further on the slender account here given of Mr. Procter's life, we pass on to that part of the book which is his own. No one ever had richer opportunities of studying the world of art and letters. A list set down by the editor in a note near the beginning of this volume, and purporting to be only a limited selection from Mr. Procter's friends and acquaintance, includes most of the writers, painters, and musicians who have been eminent in England during the last half-century. The notes and memoranda now published are naturally confined to those who are not now living; we may presume that much remains unpublished which may be of no small value hereafter to the historian of modern English literature. Mr. Procter's recollections deal partly with leading figures such as Lamb, Hazlitt, and Leigh Hunt, of whom there is, after all, not much left to be known. Even in these cases, however, his remarks have the freshness of keen and sympathetic observation, and the authority of close personal knowledge. More curious, perhaps, to a younger generation are his notices of the lesser lights who by this time can afford to wait very few years longer for some pious chronicler to rescue them from oblivion. Mr. Procter's genial sketches will go far to perpetuate some of these names. Take, for example, this picture of George Croly, who for a while seriously passed for a poet:—

He had a large and not prepossessing person, and a dashing and somewhat imperious manner; held violent Tory opinions; expressed them very energetically; and played not unpleasantly on the violin.

The author of "Paris in 1815" had great admirers amongst his Irish friends. His sisters—who were naturally proud of his talent—were persuaded, as they said, that George was destined "to push Lord Byron from his throne." They repeatedly asserted this, very frankly; but I never heard that Lord Byron's equilibrium was at all disturbed.

There are a good many miscellaneous notes about Coleridge and Wordsworth, and a really eloquent passage on the effect of Wordsworth's poetry. This may be taken to represent the impression he made on those who had ears to hear at the time when his message to the world was fresh:—

As you read the verse of Wordsworth, his words frequently have a wonderful influence in assimilating your thoughts to his. You see the bare moors, round which the winds sleep—the hills over which the sheep move like a cloud—the sheaves, and sheets of snow the poor cottager and the wandering pedlar—and all that comes to peasant life—its loves and hopes broken down by sickness and old age. The beggar clings querulously; the shepherd toils wearily up the mountains. All that is cast upon the world by poverty comes forth, to live, and toil, and die. There are no crownings of kings; nor march of conquerors; no bevy of ladies or courtiers, who laugh and lie, who rise and flourish, and fall like the leaves in autumn; but common human nature pines and fades away, and leaves a sigh in the reader's breast, which it is long before he can forget.

Other leading writers of the time—Rogers, Crabbe, Moore, Scott—pass before us in turn; there is not much addition to our positive knowledge of them, but their personal and literary characters are touched with a light and sure hand. Procter's comparatively low estimate of Moore's poetry, perhaps a bold one at the time when he set it down, has been fully confirmed by the judgment of later generations. Concerning Sir Walter Scott we find two pleasant anecdotes that carry us back to the time when the authorship of the Waverley Novels was a mystery, and guessing it a standing exercise of wit:—

I never observed Sir Walter's self-possession disturbed, except on one occasion, when Rogers told him with a smile that Lady B——'s maid had hid herself amongst the male servants, on the landing at B—— house, to watch him as he went downstairs, the preceding evening. He seemed a little ashamed of his admirer. I met him (Scott) afterwards at breakfast, in Haydon's studio, when a circumstance occurred that threw a different light on his power of self-command. Charles Lamb and Hazlitt and various other people were there, and the conversation turned on the *variableness* of certain dramatic persons in a modern book. Sir Walter's opinion was asked. "Well!" replied he, "they are as true as the personages in 'Waverley' and 'Guy Rannering' are, I think." This was long before he had confessed that he was the author of the Scotch Novels, and

* Bryan Waller Procter (Barry Cornwall): an Autobiographical Fragment and Biographical Notes, &c. London: George Bell & Sons. 1877.

when much curiosity was alive on the subject. I looked very steadily into his face as he spoke, but he did not betray any consciousness or suppressed humour. His command of countenance was perfect.

A rather long space is given to Hazlitt. The high terms in which Procter speaks of him, compared with the very slight attention he receives at this day, suggests with irresistible force the reflection—in itself not a new one—how precarious is a reputation founded exclusively on criticism. There is a short study of Haydon, the most unfortunate of painters, who ruined himself by just falling short of genius, and might have ensured success if his ambition had been a little less, or his powers a little more. Not least in curiosity is Procter's sketch of Wainwright, the artistic criminal, who of late years has been in a manner beatified by some of the high priests of the latest fashion of æsthetic enthusiasm. With this fashion before one's eyes, it produces a strange effect to read what Procter says of Wainwright's "clever but very fantastic essays":—

These essays are upon works of art: they exhibit much cleverness and great affectation. To persons not acquainted with his manner, it may be sufficient to say that he never adverted to any painter by his usual name, but spoke of Julio Romano as Julio Pippi, of Paul Veronese as Cagliari, and of Titian as Vecelli.

The description of his character has touches worthy of an historical portrait, and which one almost regrets to find frittered away, as it were, on so obscure a subject:—

Who would have supposed that from a man who was absolutely a fop, smitten in dress, with mincing steps, and tremulous words, with his hair curled and full of ungents, and his cheeks painted like those of a frivolous demiop, would flame out ultimately the depravity of a poisoner and a murderer? . . .

He was not entirely cruel. I imagine that he was perfectly indifferent to human life, and that he sacrificed his victims without any emotion, and for the purpose simply of obtaining money to gratify his luxury. Sometimes I have suspected him of gambling. . . . He was like one of those creatures, seemingly smooth and innocuous, whose natural secretions, when once excited, become fatal to those against whom they are accidentally directed.

A very kindly notice of Keats is followed by a very severe one of Godwin—almost the only severe judgment, so far as appears, which Procter passed on any of his acquaintance. He is set down as "very cold, very selfish, very calculating." His philosophy, such as it was, never generated pity or gratitude. His sympathies and generousities and liberal qualities showed themselves only in print." Both Godwin's person and his philosophy have been lately set before the public to an ample extent by thoroughly competent hands. We leave it to the reader, after consulting Mr. Keegan Paul or Mr. Leslie Stephen, to affirm or qualify Procter's opinion as he may see fit. Procter shows also a certain dislike for Do Quincey, which is less accounted for and less accountable than his aversion to Godwin.

The unpublished verses which form part of the book are graceful and true in feeling, but hardly more. The "Letters from Literary Friends" include two from Byron and several from Jeffrey. There is also a series from Beddoes, a man of some genius prematurely cut off. In a letter of his from Göttingen occurs a good remark on the national vanities of Europe:—

You people in England have a pretty false notion of the German character, and flatter yourselves with your peculiar and invincible moral self-complacency that you know all about it: for national vanity I believe after all you are unequalled. The Frenchman rests his boast on the military glories of *la grande nation*; the German smokes a contemptuous pipe over the philosophical works of his neighbours, but the Englishman will monopolise all honourable feeling, all gentle breeding, all domestic virtue, and indeed has ever been the best puritan.

Beddoes also notices from his own observation a striking literary coincidence which seems to have escaped attention in England—namely, that Milton's "Better to reign in hell than serve in heaven" was anticipated almost in corresponding words in Vondel's tragedy of *Lucifer*.

The volume whose contents we have just run through may provide a reader willing to be amused with some hours of very sufficient entertainment. But we must confess that our pleasure in handling it has been sorely damped by the conviction that the subject and the occasion ought to have called forth something much better.

POLLOCK'S DIGEST OF THE LAW OF PARTNERSHIP.*

THE manifest reluctance of the Legislature to deal with the gigantic subject of legal codification seems to have stimulated individual endeavour to anticipate in part the task which must sooner or later be undertaken by Government as a national enterprise. Digests of specific portions of the law have of late years much increased in number, and, awaiting an authoritative compendium of law in the shape of a code, these to a certain extent evolve order out of chaos, besides paving the way and preparing the legal mind for the impending reformation. Thus we have digests of the law of evidence, of the criminal law, of the law of marine insurance, and others, not to mention Mr. Fisher's laborious Digest of all cases decided at Common Law; and now Mr. Pollock adds to the number a *Digest of the Law of Partnership*.

* *A Digest of the Law of Partnership.* By Frederick Pollock, of Lincoln's Inn, Esq., Barrister-at-law, late Fellow of Trin. Coll. Cambridge; Author of "Principles of Contract at Law and in Equity." London: Stevens & Sons, 1877.

A digest may be regarded as holding a position midway between a text-book and a code, being the nearest approach to the latter of which private effort is capable. A code must be authoritative, and therefore a codifier must be endued with plenary powers of legislation. Moreover it would be essential to eliminate from a code which is to be the law of the future all propositions or expositions of doubtful stability, all anachronisms of the Common Law, and all statutes which experience may have shown to effect more harm than good. A code which required frequent amendment would soon become confused and useless; the great aim of codification should be finality. In the present condition of the law nothing is commoner than to hear judges express regret that, in consequence of the unsatisfactory or imperfect provisions of a statute, they find themselves compelled to decide contrary to the manifest justice of the case, while frequent Statute Law Revision Acts, with long schedules of repealed Acts, testify how large is the mass of effete or mischievous legislation. Then the Common Law occasionally shows itself to have by no means kept pace with the requirements of the age, while custom of trade or the law merchant is but slowly acquiring that recognition which is its due. Again, much of our case law is still open to reversal by a higher tribunal, and many decisions would, if carried up, be doubtless so reversed. Thus the promulgation of anything worthy of the name of a code would involve a process not only equivalent to the Parliamentary reconsideration of every unsatisfactory or obsolete enactment in the statute-book, and of the Common Law, but also the carrying up to a court of final appeal of every decision resting on less than ultimate authority—an undertaking from which the imagination shrinks appalled, and one from its nature as well as its magnitude utterly beyond the power of any private person. A code, in short, must enunciate the law as it should be; a digest, as its name expresses, takes the law as it finds it, and makes the best it can of it. A digest differs, on the other hand, from a text-book in its more orderly arrangement, obviating that incessant reference to the index which is the bane of the latter class of works, and in omitting all overruled cases and repealed statutes, the ordinary text-book usually referring to such on one page only to contradict them on the next.

Mr. Pollock recognizes this essential distinction between a digest and a code in the introduction to his work, insisting on the necessity for substantive amendment and legislation in any effective scheme for the codification of English law, and justifying the publication, until such codification be accomplished, of digests or "statements of the law just as it is in a codified form," on the ground of their utility "not only for present use, but to call distinct attention to the points where amendment is needed." But, as though he thought that he had unduly disparaged the dignity of his own undertaking, Mr. Pollock subsequently, after referring to various systems of codification and the delusions current on the subject, says:—"The foregoing remarks may be considered to apply, to a certain extent, to the setting forth of the law by private writers. The same advantages which are claimed for authentic codification should be to a certain extent attainable if the claim is well founded, by the adoption of the same form in text-books. But the necessary deductions and qualifications, grave as they are, can easily be supplied, and I forbear to dwell on them." The "necessary deductions and qualifications" simply amount to the entire absence of legislative authority or force, and render the two things as different as are a Bill and an Act of Parliament.

Regarded, however, as a digest—that is, as "a statement of the law just as it is, in a codified form"—Mr. Pollock's work appears eminently satisfactory. It barely extends to a hundred and twenty pages, and yet it would be hard to point to the omission of anything having a material bearing on the law of partnership. The author has accomplished this condensation without incompleteness by means of the rigid exclusion of all matter not strictly and solely pertaining to the subject of which he treats, or which would be more naturally looked for in works relating to other branches of the law. Thus he omits all mention of Companies; for, though these are theoretically only overgrown partnerships, yet their constitution and regulation have been so affected by specific legislation that the analogy of such corporations to ordinary trading partnerships is well nigh gone. Take the whole mass of enactment and decision as to registration, prospectuses, issue of shares, directors and their qualifications, memoranda and articles of association, general meetings, winding-up and contributories—all this is peculiar to Joint Stock Companies, foreign to ordinary partnerships. In fact, the distinctions are so many, the resemblances so few, that the two subjects are far more fitly treated separately. Mr. Pollock's strict adherence to the above-mentioned rule also preserves him from that laborious and futile application of general principles to the particular subject in hand which so increases the bulk without enhancing the utility of the majority of text-books. Whole chapters are frequently devoted in such works to the adaptation of general and unquestioned doctrines to the cases under consideration, without even a suggestion that their bearing or character is in any way varied by the nature of their object. As Mr. Pollock says:—

The capacity of persons to become partners is not different from their general capacity for contracting; that question, accordingly, is left aside, as belonging to the general law of contract. In the same way the manner in which the existence of a partnership may be proved belongs to the law and practice of evidence; nor has it been expressly stated that no particular form is required for the contract of partnership, as the law of contract in its modern shape assumes throughout that no special form is needful where none is expressly prescribed. So, again, the general principles of agency are not entered upon, though they are the foundation of the special rules

which determine a partner's authority as agent of the firm. For the like reason, nothing is said of fraud as a cause for rescinding the contract of partnership, the liability to rescission on this ground being one to which it is subject in common with all other contracts, and which in this application presents no peculiar features.

This laudable intention is honestly carried out by Mr. Pollock, and it would be an unquestionable benefit if his example were to be followed by future text-writers.

The arrangement of the work is not alphabetical, as is the case in some digests, but in the form of definite propositions of law, each followed by illustrations drawn from reported cases. This plan seems to us a good one. Alphabetical arrangement, though it may possibly add to the value of a work as a book of reference, entails the total sacrifice of order or sequence, and renders it absolutely useless as a text-book. Mr. Pollock's propositions follow one another in logical and natural connexion, and the illustrations seem to be carefully and fitly selected, though there is always danger lest, when slightly different cases follow one another in close succession, the mind may more readily seize the similarities than the distinctions they are intended to illustrate. The method appears, however, to have answered in the case of the Indian Contract Act of 1872, which Mr. Pollock avowedly takes as his model.

It is not easy to criticize a book like the present in detail; but we may briefly comment on those few points on which we have the misfortune not to agree entirely with Mr. Pollock, premising that such defects as do occur in the volume seem to be mainly attributable to the difficulty of stating the law in categorical propositions, since few rules relating to a complicated subject like partnership are so general and unqualified as not to be liable to exception or modification in some cases. Thus, at the very outset, Mr. Pollock is met by the practical impossibility of giving an absolute and unassailable definition of partnership; an impossibility recognized on previous occasions both by the Judicial Committee of the Privy Council and by Mr. Justice Lindley in his well-known book on the subject. The former, in an important Indian case, laying down somewhat vaguely that whether or not a partnership exists in any case must depend on the real intention and contract of the parties; while the latter, at the commencement of his book, contents himself with collecting a number of attempted definitions, and leaves the reader either to adopt some one of them or to evolve a general notion of a partnership from the mass. It was at one time considered, on the authority of the House of Lords in the well-known case of *Cox v. Hickman*, that the mutual relation of principal and agent between persons furnished a tangible test of partnership; but this doctrine has since been so strenuously and pertinently questioned, particularly by the present Master of the Rolls in a recent judgment referred to by Mr. Pollock in his Addenda, that it would be unsafe to lay any stress upon it at the present day. Mr. Pollock's definition is taken from the Indian Contract Act, before referred to, and is as follows:—"Partnership is the relation which subsists between persons who have agreed to combine their property, labour, or skill in some business, and to share the profits thereof between them." In deference to the high authority on which this definition rests, and the confessed inability of the exponents of the law to arrive at a more satisfactory one, we do not presume to criticize it, further than by suggesting that it might possibly be made clearer than it is that the partnership concern may be composed of property contributed by one partner, and labour or skill by another; and also that the profits, the division of which forms so important a feature in partnerships, are net and not gross profits.

Some little confusion might arise from Mr. Pollock's statement, in p. 10, that "the business of a firm may be carried on under any name, not distinctly purporting to be a corporate name, which the partners think fit to adopt for that purpose," since—as he subsequently shows, and as is clearly law—an unincorporated partnership is at perfect liberty to assume the name or style of "the so-and-so Company," whereas, to the uninitiated, the word Company would appear distinctly to purport to be a corporate name. Such, however, is not the case; and, in fact, the absolute title "corporation" would seem to be the only one from the adoption of which private firms are debarred. In dealing with the somewhat technical subject of "liability by holding out," or the doctrine by which a man is held to be a partner who has induced, or allowed others to induce, third parties to give credit to a firm by the representation that he is a partner therein, Mr. Pollock propounds two statements of the law, of which the first, which is as follows, is manifestly incomplete:—"A person who has by words spoken or written, or by his conduct, led another to believe that he is a partner in a particular firm, is responsible to him as a partner in such firm." This proposition, if it stood by itself, would naturally suggest the inquiry "Responsible for what?" and it is not until we reach the next paragraph, which practically states the same doctrine in another form, that we gather that such responsibility extends to any credit given to the firm on the strength of such representation.

When speaking, in p. 26, of the peculiar rules affecting the management of associations "too numerous to act in the way that an ordinary partnership does," Mr. Pollock makes a suggestion which is, as far as we know, novel, and which seems clearly in accordance with reason and law—namely, that since the passing of the Companies Act 1862, which renders illegal all unincorporated trading societies consisting of more than twenty persons, no such association composed of less than that number of members would be considered as constituting a partnership excluded by its size from any of the rules affecting ordinary partnerships. The ques-

tion is not perhaps one of much practical importance, but the deduction from the terms of the Act is ingenious and forcible.

The author's treatment of illegality in the object of a partnership strikes us as meagre, being confined to the cases where that object, legal in the inception of the partnership, subsequently becomes illegal through extraneous circumstances. Perhaps it was considered unnecessary to state such an obvious proposition as that a partnership formed for an illegal object is void; but the omission has deprived the author of the opportunity of introducing among his illustrations one of those amusing cases which form cases in the desert of a legal work. We refer to *Everet v. Williams*, quoted by Mr. Justice Lindley, where a bill was filed by one highwayman against another for an account and division of their joint plunder. This unique document set forth with much delicacy of expression that "the plaintiff was skilled in dealing in several commodities, such as plate, rings, watches, &c.; that the defendant applied to him to become a partner; that they entered into partnership, and it was agreed that they should equally provide all sorts of necessaries, such as horses, saddles, bridles, and equally bear all expenses on the roads, and at inns, taverns, ale-houses, markets, and fairs; that the plaintiff and the defendant proceeded jointly in the said business with good success on Hounslow Heath, where they dealt with a gentleman for a gold watch;" it then referred with equally graceful circumlocution to several similar partnership transactions, including one in which "the defendant informed the plaintiff that there was a gentleman at Blackheath who had a good horse, saddle, bridle, watch, sword, cane, and other things to dispose of, which he believed might be had for little or no money; they accordingly went, and met with the said gentleman, and after some small discourse, they dealt with him for the said horse, &c.," and finally stated the results of the partnership dealings to amount to 2,000*l.* and upwards, concluding in the ordinary form with a prayer for a partnership account. The result of this curious suit was disastrous, the Bill being dismissed with costs, to be paid by the counsel who had signed it, and the plaintiff's solicitors being attached, and fined 50*l.* apiece for their attempted abuse of the process of the Court.

The statement made by Mr. Pollock in p. 97 that "actions between a firm and one of its own members, or between two firms having a common member, which were allowed by the law of Scotland, remain, it is conceived, inadmissible in England," appears to be too broad and sweeping. It is clear that in certain cases such action will lie, as, for instance, an action for damages for the breach of an express agreement entered into by one partner with another, where the damages, when recovered, will belong to the plaintiff alone; or where a person agrees to become a partner with others and to furnish a certain amount of capital, and makes default in so doing, in which case they can sue him at law for damages, although he as well as they was to have an interest in what he undertook to furnish.

The unimportant character of some of the objections we have thus taken is perhaps the highest compliment we could pay to the accuracy of Mr. Pollock's work, as indicating the absence of any serious ground for adverse criticism. The book is praiseworthy in design, scholarly and complete in execution. As a step in the right direction it merits success, and we only fear that there will be ample time for it to pass through several editions before it is superseded by the arrival of that consummation devoutly to be wished for, a systematic and authoritative codification of English law.

ANCIENT IVORIES.*

THE oldest art of the time is the art of carving on ivory. It would almost seem as if the beauty of the material had excited the faculty of carving it into beautiful forms. The earliest remains in Western Europe yield fragments of bone incised with pictures by some prehistoric Landseer. The graves of Egyptian kings so old that all modern chronology has to be rearranged to include them contain ornaments of ivory. Mr. Maskell speaks of some in the British Museum as dating from the "time of Moses," and a box at the Louvre bears the name of Hatsou, a queen of Egypt who must have lived many centuries earlier. The Pyramid builders were ivory-carvers. The Ninevites both imported carvings from Egypt and made them for themselves. Six centuries before Christ the Cypselidæ sent to Olympia an offering which consisted of a coffer of cedar inlaid with gold and ivory. The cryselephantine statues of the time of Phidias have been made famous for us by ancient writers, though nothing of them has come down to us. Though such sculptures of the Roman time before Constantine are extremely scarce, they do exist, and from the fourth century of the Christian era we have a complete succession of works—a fact which sets ivory-carving alone among the arts. The consular tablet gave way to the religious triptych. The triptych was in its turn supplanted by the heathen imagery of a more advanced Christian age, but until our own day the art has survived. It is perhaps, as an art, at a lower ebb now than at any previous period since the third century, but signs are not wanting of a disposition to revive it, and meanwhile mere mechanical skill in cutting is being attained. The efforts of the authorities at South Kensington have been directed, not only to the collection and arrangement

* *Ivories: Ancient and Medieval.* By William Maskell. Chapman & Hall.

of a series of examples, but also to the illustration of foreign specimens by a large number of casts representing the best works to be found in Continental museums. Thus, could a modern artist be induced to carve in ivory, he would be able at his leisure to study the ancient carvings, and there is little doubt that his efforts would be welcomed by the public. The same industry which year after year gives us marble statues might give us ivory statuettes. Statues are not popular in England. We cannot put them in the open air without the risk of seeing them destroyed before our eyes by our benignant climate, and they are always out of place in rooms smaller than the Egyptian Hall or a large conservatory. But plaques, or busts, or statuettes, or, in short, any of the forms now produced in bronze and stone, would look just as well, and be far more easily disposed of, if they were cut in ivory. A man who goes to the Academy loving sculpture can only indulge his taste if he dwells in marble halls, and has great galleries in which to set out his purchases. Could we but persuade some sculptor or painter of talent to take to ivory, sculpture would no longer be considered an unpopular art.

The series of handbooks edited by Mr. Maskell has already been noticed collectively (*Saturday Review*, November 20, 1875). The present volume is his particular contribution. He deserves the thanks of all admirers of the beautiful in art for calling attention to ivories, as he did many years ago, and by these further efforts he brings the results of his early study within the reach of every one. It is an encouraging sign of the times that such little volumes as these can be produced without serious, if any, loss. It is not easy to see what purpose can be served by having one collection at the British Museum and another at South Kensington; but as things are, and as the junior institution is avowedly educational, while the older museum, if originally founded with a similar view, has of late years been content to obscure it, we need not now draw any invidious comparisons. It is of course worth while to remember that, were the two collections put together, they would form, as one whole, by far the finest in the world; but until we have a gallery fit to display our matchless sculptures, and another for our drawings, we must be content to see our ivories by instalments, and console ourselves with the thought that at least we have them somewhere.

The substance of the present treatise formed the preface to the Catalogue of the South Kensington Museum. Here, however, it is slightly enlarged, especially by the incorporation of foot-notes with the text, and affords a convenient and portable handbook. The art of carving in ivory is described historically rather than critically, and the woodcuts are chosen rather with a view to elucidating the letterpress than to increasing the attractions of the book. Mr. Maskell begins by endeavouring to define the meaning of the term "ivory," and wisely decides to include bone, walrus, narwhal, hippopotamus, and fossil ivory. With equal wisdom he avoids the controversy as to the words "ivory" and "elephants," on which so much useless learning has been spent in vain. With regard to the average size of tusks, his conclusions differ somewhat from those of the late Sir Emerson Tennent, and are chiefly concerned with the puzzling fact that no tusk now extant would afford pieces large enough for the plaques and diptychs of the middle ages. The leaves of one diptych at Paris measure each fifteen inches in length, and nearly six in width, while a single tablet in the British Museum is sixteen inches and a quarter long, and five inches and a half broad. Yet the largest of the tusks at the South Kensington Museum is only sixteen inches and a half in circumference; and a pair exhibited in 1851 did not exceed twenty-two inches in circumference at the base. Mr. Maskell notices at some length the supposition that the ancient carvers were able to bend the pieces of ivory or to flatten them, and gives some recipes for the purpose, but adds that, when tried in modern times, all these methods have failed.

With regard to the art itself, Mr. Maskell treats impartially of all the different schools—with, we think, one exception. He makes little or no mention of the ivory-carvings of the best period of Saracenic or Arab art. The builders of the mosques of Cairo did not neglect the use of so beautiful a material. Mr. Maskell speaks indeed of the Moorish art in Spain, but in rather a slighting way. But a private collection with which we are acquainted contains an ink-horn which would furnish Mr. Maskell with one more name of an artist to add to the only two hitherto known. He remarks on the rarity of such names. Sir Digby Wyatt and M. Labarte only met with one. Jean Lebraellier was carver to Charles V. of France, but no work of his is known. Mr. Maskell finds the name of a carver of a pax in the British Museum to be Jehan Nicolle, as cut upon the ivory, which still exists. To these two names may be added that of "Achmet the Scribe," who made the beautiful inkhorn of which we have spoken in the year 869 of the Hijra, or about 1490 A.D. In his second chapter Mr. Maskell gives us a summary of the references to ivory in the Bible, and goes on to speak of the Egyptian specimens in the British Museum and the Louvre; so far as we can judge from the Catalogue, there are none of this class in the South Kensington Museum. As Mr. Maskell seems to allow, they are often highly artistic, but are very seldom to be met with. The British Museum contains two daggers, several chairs, and other articles inlaid with ivory, and among separate carvings two boxes made in the shape of water-fowl, a statuette, and several articles of the Roman period. The Louvre has a small box of the period of the sixth dynasty, the heads of a duck and of a gazelle of great beauty, and a few other objects. There are some ivory inlays at Boulak, but little else, and by far

the most important Egyptian specimen with which we have met is a head in the private collection mentioned above. It is only about two and a half inches in height, but delicately carved, the beard being represented in the stiff conventional manner by a piece of ebony. It evidently formed part of a small mummy figure or Osiris of some other material. No other example of the kind is known, but it is impossible to ascertain the date with any exactness. In a tomb at Thebes there is a record of a statue of ebony and ivory with a collar of gold.

The occurrence of Egyptian ivories at Nineveh is interesting. There are, in all, above fifty Assyrian specimens in the British Museum. The Etruscans excelled in this art as in so many others, and Mr. Maskell considers that some examples of their work to be seen in the British Museum have never been exceeded in spirit and execution either in ancient or modern times. The Romans of the Empire inherited the arts of Etruria; but ivory of the first three centuries of the Christian era is, for some unexplained reason, very scarce, and the "gradual and uninterrupted decline of art from the days of Augustus is to be traced as distinctly in the ivories which have been preserved as in ancient buildings." A considerable addition to the national collection has recently been made from Chiassi, but has hardly yet been noticed by antiquaries. After the conversion of the Empire, ivory became more common, and Mr. Maskell observes that, "from the middle of the fourth century down to the end of the sixteenth, we have an unbroken chain of examples still remaining." To the fashion of sending consular diptychs to people of rank in the provinces, and to the subsequent fashion of dedicating the tablets in churches, we owe the preservation of some of the best carvings now extant. Mr. Westwood has enumerated twenty-one consuls whose tablets have been identified, of which the earliest, of the year 248, is in the Meyer collection at Liverpool, as well as leaves of three others. At South Kensington there is one complete diptych and half of another, both of the sixth century. In the British Museum there is one leaf of the tablets of "M. Aurelius Romulus Caesar," consul in 308. The latest in date is that of the last of the regular succession of Roman consuls, Basil of Constantinople, after whose year of office, 541, the "Emperors of the East took the title, until at length it fell into oblivion." One leaf is in the Uffizi, and the other in the Brera. Mr. Maskell suggests that careful search in Spain might reveal other specimens, and mentions the supposed existence of one at Tarragona. There are many fine tablets not consular, and the transition from the civil diptych to the religious triptych is easily traced.

Mr. Maskell, who is perhaps more at home in the thirteenth century than in the third, relates the subsequent history of the art with great care and some minuteness of detail. The retablo of Poissy, in the Louvre, is perhaps the largest and finest example remaining, though carved in bone, containing as it does about seventy separate plaques, and being no less than seven feet six inches in width. It was made for the brother of Charles V. of France, and a smaller example of the same kind of work is in the Hôtel Clugny. If this record is the largest, a "pietà" at the British Museum is the smallest, and perhaps the most beautiful, of the religious ivories remaining. It is less than three inches in height, and consists of two groups so arranged that one, representing the Agony in the Garden, is formed without distortion on the back of the other and more important face. A little colour still remains on this beautiful carving, which one would be glad to claim as English, but Mr. Maskell says nothing of its origin. Yet there are several good specimens of English work in existence, the most curious and perhaps the most valuable among them being a casket in the British Museum, generously presented by Mr. Franks to the nation, which dates from the eighth century. It has representations of scenes in the Roman and Scripture histories, and is carved in bone, taken, as the inscription states, at Ferry Hill in Durham, from a whale which "was gashed to death in his gambols as aground he swam in the shallows." This would be a much more useful book if it had a good index, the present one being a mere make-believe.

A NILE NOVEL.*

WE are inclined to congratulate Mr. Fleming on his idea of writing a Nile novel as an agreeable variation on those books of Nile travel which overflow the book market in a periodical inundation. The traveller of literary tastes who is reduced to metaphorical lotus-eating on the deck of his dahabeah may well be driven in sheer despair to exorcise the demon of ennui with pen and ink. Were it only possible to sweep from mind and memory, in such a conflagration as is said to have consumed the library of Alexandria, the innumerable volumes that have been compiled by Nile tourists, what a field there would be for him to exhaust his energies in! The most prosaic of mortals can hardly help waxing romantic over the memories that have been slumbering among those temples and tombs, where fragments of mythology and historical fact lie scattered as thickly as the dust of the mummies. But unhappily there is not an idea that has not been appropriated and utilized again and again. Since the days of Herodotus the land of the Pharaohs has been a favourite sojourn of enthusiastic *savants*; even the invading armies of Bonaparte had a strong scientific corps on their muster-roll;

* *A Nile Novel*. By George Fleming. London: Macmillan & Co 1877.

and the knowledge that has been laboriously accumulated in the course of indefatigable generations has been neatly condensed in compendious handbooks. Unless you have the luck to hit off such an excavation of your own as Miss Edwards records in her recent volume, you may diffuse your intelligence and information in a comprehensive work that contains not the faintest glimmering of novelty. As for the lighter treatment of the characteristics of native social existence, to say nothing of authorities like Sir Gardner Wilkinson, are there not such standard classics as *Eothen*, and the charming Letters of Lady Duff Gordon? Oddly enough, however, the realms of local romance have been left comparatively unexplored. There is Kingsley's *Hyppatia*, which carries one back to a classical past, and About's *Pellah*, which is a political and agricultural treatise brightened by fiction. But, so far as we remember, Mr. Fleming is the first who has sent his heroes and heroines to travel under the charge of a Reis and the care of a dragoman, and has laid the scene of his Western flirtation and love-making on the bosom of the mysterious stream that has been the standing puzzle of geographers. His conception was a good one, and his success has been very creditable. The form of his work absolved him from the necessity of boring his readers with detailed descriptions of the famous scenery and temples which ought already to be photographed on their minds. But, writing with the taste and feeling of an artist, he has made free use of the local colouring, enlivening the familiar spots on the banks with fresh incidents as they suggested themselves to his fancy. He indulges in description when the inspiration takes him, and glides by the monotonous panorama in silence when he has nothing particular to say. And in his more finished pictures, as in his slighter sketches, he shows his command of the artistic faculty; and the palm-trees, the pelicans, the flights of pigeons, the quaintly-draped villagers, the curiosity vendors, the dancing-girls, and the donkey-boys are brought in judiciously to enliven the landscape. Mr. Fleming writes well; yet occasionally it would seem as if he had both written the story and revised the proofs in the absence of commonplace but useful authorities. Americanisms are rare, but now and again some word is coined, or changed into something which sounds gratingly like a barbarism; and there are one or two odd misspellings, especially in classical and geographical names. Then Mr. Fleming seems to be under the impression that it was old Pluto who was the god of wealth; and, when he talks of the Church "of the Salute" at Venice, he would appear to have forgotten the legend of its foundation. These, however, are trifles in a work that should aim at amusement rather than instruction; and when a man can use his pen as cleverly and brightly as Mr. Fleming, we are content to forgive him even more serious slips.

The romance of the Nile voyage lies of course in a love affair, whose upshot is involved in uncertainty to the last. Bell Hamlyn, the heroine, certainly behaves badly; and the author, with whom she is clearly a great favourite, can only plead in extenuation the infirmities of human nature. But we may add that the circumstances in which we are introduced to her conspire strongly to sap her constancy. The life in a dahabeah to a lively girl must become intolerably dull without flirtation; while, on the other hand, when the young lady is pretty and amiably disposed, innocent flirtations easily pass into something far more serious, and volatile admirers become earnest and passionate lovers. In this case there was just sufficient rivalry in the presence of two or three couples of young people to give some piquancy to what might otherwise be a little tame. Then the temptations are so great, and the opportunities so many. Reposing among glowing lights under the shade of the palms and the influence of the sensuous atmosphere, or on the deck of the dahabeah by moonlight behind the kindly screen of the latteen sail, you are almost bound to make love, and then your feelings speedily run away with you. Bell Hamlyn was in rather dull company on board her own boat. Her father was a self-made man, who was generous and indulgent but decidedly unsympathetic, and with her stepmother, who was a girl of almost her own age, she had little in common, though they were excellent friends. It was no wonder that she should be animated by a fresh interest when she came across a fascinating man, apparently stricken by some stinging heart-sorrow. We are supposed to acquit Arthur Livingstone of any under-hand designs; for he has been in the habit of professing and displaying a distaste, and even a contempt, for the fair sex. In fact, he had first made an impression on Miss Hamlyn by the persistence with which he declined to make himself agreeable to her at the table-d'hôte at Cairo, where she had remarked his looks and his distinguished manner. But now, when they have met up the Nile, Livingstone can hardly help himself; he must talk, and is bound to be decently civil. Only in their intercourse he assumes paternal airs of authority, and addresses her with a winning affectation of bluntness which she would assuredly never have tolerated had he been older, or uglier, or less interesting. The natural consequences ensue; the more inevitably that Hamlyn père is anxious to see his daughter creditably married. The misogynist Livingstone is actually persuaded to transfer his luggage to the Hamlyn's boat, and in ordinary circumstances all would have gone well. But unfortunately Bell was engaged beforehand to a certain Mr. George Ferris, who is studying art in Italy, and who in a most unlucky hour for himself had recommended his friend Livingstone to make the Nile voyage. Bell's tardy confession of her entanglement intensifies all Livingstone's former bitterness. He casts her off with perhaps excusable hardness, and the engagement which they had never avowed seems to

be broken off now and for ever. But the mutual passion is stronger than they had fancied; and they are brought together more than once for more "last words" and leave-takings. So that Mr. Fleming, by what is rather a trick of art, and at considerable sacrifice of probability in his characters, keeps us in doubt to the very end as to which of her admirers Bell is to marry, or whether she is to die an old maid. Yet all the time we are made to feel that the last alternative would be eminently regrettable, and we are anxious that she should be made happy in her own way. We see little of the man to whom she had rashly engaged herself, nor do we hear much of him. Yet the author has ingeniously managed to convey the notion that, though Ferris is a fine fellow, with talent and high spirits, he is scarcely the husband to make Miss Hamlyn happy. And we should be even more lenient than we are to her jilting him were it not for an impulsive action of hers which Mr. Fleming, in our opinion, should never have permitted, since it tends gratuitously to chill our sympathies. When she knows that she has ceased to care for Ferris, when she has set her affections finally on Livingstone, and is restless and unhappy in the uncertainty of the future, she sits down deliberately to write to Ferris that she fondly relies on the constancy of his love.

As for the rest of the people, although they play very secondary parts, as they ought to do, they are all natural and cleverly defined. Old Hamlyn is what we should expect to find him—a shrewd, hard-headed man, with a show of *mauvaise honte* in society, which is owing to his humble or doubtful antecedents, and who exhibits no great refinement of feeling, as when he presses on Livingstone a berth in his dahabeah, with the full intention of marrying him to his daughter. The English family with whom the Hamlyns strike up an intimacy are not altogether favourable specimens of the nation, and yet we are bound to say there is nothing caricatured in the portraiture. Old Mr. Campbell is a gentleman, though a fool and a prig; and his daughter Gerty, an irreclaimable flirt, so far from making pretensions to be other than she is, is amusingly honest in the candour of her confessions. The Merediths are simply what are commonly called "nice people," while Blake, who is the rattle-brained Irishman of the stage, is brought in as a foil to the gravity of some of the others. For, although the conversation is generally light and lively, and not unfrequently really clever, yet now and then, in apparent deference to the genius of Egyptian erudition, Mr. Fleming will make some one of his gentlemen tediously didactic; so that sometimes, when Livingstone is discoursing of antiquities, we fear he must be playing Mr. Ferris's game. As for those descriptions of scenery to which we have already adverted, they are not merely poetically telling, but technically exact. Mr. Fleming has not only enhanced the general effects, but studied the arborical and geological details. A fair specimen of his style is the account of the change in the landscape when the travellers had left Egypt proper behind them and crossed the frontier of Nubia:—

The only narrow thing in Nubia is the country itself. A vaster sky than that of Egypt bends over the long limitless plains of undulating sand, and the widening Nile stretches like a waveless sea from furthest shore to shore. Sometimes the limestone cliffs recede, lower, disappear, then, at a sudden turn, come crowding back again to the water's edge, hardly leaving room enough for the narrow strip of green, not six feet wide in places, which forms the land of Nubia. . . . The scenery too has changed. The short thick dôm palm, whose stubby plumelike branches start almost from the ground, has to a great extent supplanted the slender tree of Egypt. The landscape is beautiful, mournful, monotonous. For days and days they see nothing but the long, long stretch of shining river, and the long, long reach of shining desert, with here and there upon the bank some thick-set grove of castor-oil trees, fifteen or twenty feet in height, &c.

FRENCH LITERATURE.

M. NISARD'S sketches of the Renaissance period are now forty years old, and were originally published in the *Revue des Deux Mondes*. The edition we have before us is the third*; the author has merely reprinted his two volumes, limiting his corrections to a few details of style, and adding a new preface. The first monograph is devoted to Erasmus, the most literary person in the group, a student who thought in Latin, and who reminds us in his writings sometimes of the younger Pliny, sometimes of St. Augustine. As M. Nisard remarks, no one having the slightest pretensions to be called a scholar would like to acknowledge that he has not read a few pages of Erasmus; and accordingly the biography of the Rotterdam Latinist is followed by a selection of extracts from his works, giving the Latin text with a French translation. Sir Thomas More and Melancthon divide between them the second volume, and thus we have the sixteenth century represented in its three chief manifestations—Protestantism, Roman Catholicism, and Christian philosophy, or, to speak plainly, Orthodoxy tempered by a small dose of Free-thinking.

Next to M. Nisard's essays we may place M. Gebhart's volume on Rabelais.† Here Orthodoxy reaches its minimum, and Free-thinking concludes a close alliance with that *style folâtre* which sounds very much like profanity. Our author does not attempt to vindicate the great *abstruseur de quintessence* from the charge of coarseness, and, like the prologue in old plays, he brings him

* *Renaissance et réforme*. Par M. Nisard. Paris: Lévy.

† *Rabelais: la renaissance et la réforme*. Par Emile Gebhart. Paris and London: L. Hachette & Co.

forward on the stage, introduces him to the public, and makes him get through an apologetic speech. M. Gebhart's work, crowned by the French Academy, is an exhaustive disquisition on Rabelais; its only fault perhaps is that, like all *éloges*, it is a piece of special pleading in which no room can be found for serious criticism. The first part treats of Rabelais as a man. What influence did the Renaissance exercise upon his mind? How far did the spirit of the Reformation affect his religious views? Radically opposed to the principles of monasticism, scandalized by the corrupt state of the Church, he began by leaning towards Protestantism, but soon settled down into the matter-of-fact, quasi-sceptical attitude by which he is better known. The second division of M. Gebhart's work deals with Rabelais as a writer; and the third part, devoted to a minute examination of the "Pantagruel" and the "Gargantua," ends with a chapter in which Rabelais is compared with Aristophanes, Cervantes, and Swift.

M. Charles de Mazade has been able to write his excellent biography of Count Cavour* with the help not only of public documents and State papers, but of private letters which throw considerable light upon the Piedmontese statesman. We need scarcely say that the volume before us is written in praise of Cavour, whom M. de Mazade regards as the model of a true patriot. The grand problem of the unity of Italy, devised and carried out with unflinching perseverance, naturally reminds one of Prince Bismarck's success in accomplishing the same thing for Germany. Making every allowance for M. de Mazade's anti-Teutonic feelings, we think he has seized the point of difference between the Italian patriot and the Chancellor of the Empire. Cavour's glory is that he constantly acted under the inspiration of liberal ideas, and that he scorned to employ the weapons of persecution even to obtain the great object of his life. Prince Bismarck, on the other hand, impatient of opposition, relying upon brute force, and violently trampling down opposition, wins present triumphs at the cost of creating difficulties for the future.

M. Jules Siegfried, in a little volume which well merits attention, discusses the history, the causes, and the remedies of poverty.† He begins by a short introduction on the history of pauperism, and then examines the institutions, political, moral, intellectual, and religious, which are best calculated to minimize it. His starting-point is essentially that of Christianity, although he is careful not to place his ideas under the sanction of any particular sect. The interference of the State in this matter is no doubt necessary, but it is not, as Socialist theorists maintain, the exclusive panacea; private charity must come in likewise, and the habitual practice of intelligent liberality has the twofold effect of offering a remedy for a serious evil, and of indirectly benefiting him who devotes his time and his energies to the good of the indigent.

M. Siegfried, it will be seen, does not share the opinion so fashionable at the present time, which sacrifices man to society, and considers society, no longer as a means, but as the end, in the destinies of humanity. M. Bertauld adopts the same principle in a small volume‡ which contains sketches of men who at various times have played a more or less important part in the history of applied philosophy. Mr. Herbert Spencer and Lord Macaulay, Strauss and M. Caro, Rivarol and Mr. Matthew Arnold are the chief characters selected for his gallery of portraits, and their writings give him occasion for expressing his own views on the position which law (*le droit*), ethics, and religion should hold respectively in the constitution of the modern world. According to M. Bertauld, ethics and religion are distinct from each other, but religion, the most perfect form of which is Christianity, is an indispensable element without which virtue would be only an exception too rare to exercise a wholesome influence over society.

M. Emile Burnouf has published a remarkable work on the topography of Athens at various epochs, and he begins by declaring that the opinions of MM. Boule, Ulrichs, and Curtius must be discarded as absolutely erroneous. Not that these three writers have failed to do good service in their day, but merely that the views they hold, although quite defensible at the time when they were put forth, have been nullified by modern discoveries. The importance of giving an accurate description of the successive vicissitudes through which the city and acropolis of Athens have passed will readily be admitted when we consider that since the days of Pericles all the rulers of Greece have left traces of their occupation, and that these traces are now being gradually removed in order to bring to light the remains of the primitive city. M. Burnouf accordingly takes a survey of Athens under its different rulers, beginning with the government of the Turks, and going back to the remotest period of Hellenic history. Of course, as we proceed, facts become more and more mixed with theory and conjecture, and the last chapter, which is devoted to the ante-Pelagic period, however ingenious its conclusions, must be regarded as purely hypothetical. M. Burnouf has added to his narrative twenty-one engravings which help the reader to understand the topographical details given in the text.

Very few writers of contemporary France lend themselves more readily than M. Alphonse Karr to the labours of anthologists and compilers of elegant extracts. His novels abound in terse observa-

tions and witty criticisms on society; and his amusing periodical *Les guêpes* was for several years an inexhaustible fund of satire, sometimes rather *aristophanesque*, always highly pungent, and generally distinguished by much common sense. The volume before us* contains in a portable shape the quintessence of M. Alphonse Karr's philosophy. Stripped of the personal remarks which did so much towards the success of *Les guêpes*, but which would now be quite unintelligible, it has a permanent merit of a high order; and it will reward the attention of readers who appreciate La Bruyère and Rochefoucauld.

The *Idees et sensations*† of MM. de Goncourt belong to the same class of works. When the volume was first published, about twenty years ago, M. Sainte-Beuve, reviewing it in one of his *Lundis*, noticed the unfairness of some of the judgments and the general harshness of the whole. This fault is the more perceptible if we read the *Idees et sensations* immediately on rising from the perusal of M. Alphonse Karr's volume. There is a considerable amount of *bunkhonia* mixed with the satire of the latter moralist, whereas the tone of the former is too harsh to be pleasant.

"You know the temper of France; it wishes for the Republic, but does not intend to seek its patterns in Sparta; the model it has in view is Athens or Florence." Such was the opinion once expressed by M. Waddington in the Chamber, and it might be taken as the motto of the present work.‡ M. Perrons's earliest historical composition was a biographical sketch of Savonarola; and, when describing the agitated career of the Florentine patriot, he was already meditating the larger history he has recently published. He was only prevented from carrying his plan into immediate execution by the fact that M. Thiers had long entertained the thought of treating the same subject, and had accumulated materials for the purpose. Now, however, that the favourite scheme of the late President of the French Republic is abandoned, M. Perrons has taken it up himself, and the history of Florence down to the year 1313 is before us in three handsome volumes. As Greece is essentially identified with Athens, and France with Paris, so Florence typifies Italy much more completely than Rome, Naples, Venice, or Genoa; and, if the French Republic of 1877 is to follow the course indicated by M. Waddington, and to take Florence as its model, it is fitting that it should know in all its details the history of that busy commonwealth. Having studied and analysed the numerous authorities, both published and unpublished, which exist on the subject, M. Perrons has applied himself to his task, and, beginning with the old Fieschi, he describes in a very interesting and picturesque manner the rise and progress of municipal life at Florence, showing how commerce affected politics, and how literary and artistic culture and refinement ennobled the business habits of its merchants. The first two volumes are taken up by political and legislative history; the latter half of the third treats of social life, literature, and art; an excellent map of Tuscany and a plan of Florence have been added, and each volume is completed by a copious index. References to the principal authorities appear in formidable array at the foot of almost every page, and a few valuable documents are given in the shape of appendices.

M. Edouard Sayous has devoted his attention to Magyar studies, and, after having discussed several parts of the annals of Hungary, he now considers the subject as a whole.§ The invasion of the Moguls, the political career of Matthias Corvin, and the relations between France and the Transylvanian princes, are episodes of a history which for most readers possesses at any rate the merit of novelty, and which, treated by so competent an author as M. Sayous, could not fail to be interesting. M. Sayous has also had the advantage of being sent on a mission to Hungary by the French Minister of Public Instruction, and he has thus been able to collect an extraordinary amount of bibliographical information, of which he gives a full account in his preface. His work is divided into seven books. The first, treating of the origin of the nation, is essentially erudite in its character, and addresses itself to students of ethnography and philology. M. Sayous here describes the state of Hungary before and after the conquests of Arpad, who is supposed to have been the grandson of Attila; he then relates the series of incursions and reverses which followed the conquests by the Huns, and describes the religious and political condition of the country during the period of heathenism. The second book, beginning with the twelfth century, takes us at once on ground where the historian treads with comparative certainty, and we are thus brought by degrees to contemporary times, and to what M. Sayous calls "liberal Hungary." The decay of the Turkish Empire and the present war will probably affect in a serious manner the destinies of the Magyars; but the natural resources of their country, the patriotism of its inhabitants, and their firmness in past times under the most trying circumstances, are guarantees for the future.

The celebrated cry "Le roi est mort! vive le roi!" may be repeated with a slight variation *à propos* of the numerous educational books published during the last few years on the French language and literature. Hamel, Wamostocht, Levizac are dead;

§ *La ville et l'acropole d'Athènes aux diverses époques.* Par Emile Burnouf. Paris: Mai-Orneuve.

long live Messrs. Littré and Brachet! Foremost in the new order of things, Messrs. Hachette appear with a collection of volumes adapted to the requirements of every age, from the infant pupil in the nursery to the student who is preparing for University scholarships.† One of the latest instalments in this numerous and varied series is M. de Candole's annotated edition of Ponsard's *Le lion amoureux* ‡, to our mind a specimen of what careful editing should be. The preface contains an excellent biographical sketch, together with a brief notice of the various dramatic works composed by a writer who was long regarded as the chief of the *école du bon sens*. The grammatical and philological notes give all the necessary information and no more; and the biographical and geographical allusions which occur so plentifully throughout the play have supplied the materials for an excellent index, followed by a concordance between the Republican and Gregorian Calendars.

Under the title *Le théâtre français du XIX^e siècle* §, the same publishers have begun a collection of works exemplifying the different branches of the contemporary drama. Intended for the pocket, these little volumes are illustrated, not with all the copiousness of M. de Candole's work, but simply with the minimum of explanatory notes. The Classical or quasi-classical school, the Romantic revolution, the Vaudeville and the historical or political comedy, are represented by acknowledged masterpieces which have the double advantage of placing before the pupils choice specimens of contemporary literature and of accustoming them to a colloquial style.

M. Victor Fournel's *Vacances d'un journaliste* have met with such success that the author has been encouraged to publish a companion volume||, in which he takes us on a tour through Holland, Savoy, and Switzerland. There is plenty of scope for literary talent in the composition of a book of travels, even when the writer does not indulge in such freaks of imagination as those of M. Alexandre Dumas père. The guide-books of MM. Joanne and Baedeker are excellent models of their kind; but accuracy is their only pretension, and they can afford no room for personal anecdotes, humorous sketches, and the like. Here M. Fournel has the advantage; to the best qualities of an enthusiastic tourist he unites scholarship and taste; he is a *circoncis* without pedantry, and his sketches, dashed off as fast as the express train can carry him, are full of life. No one will regret the hour spent over his amusing little volume.

The life of M. Latour du Moulin is interesting from the political, the scientific, and the artistic point of view; and it has been very completely treated by Baron Ernouf.¶ We often see, especially in the world of politics, ambitious men living on the merit of modest subalterns, and indebted for their reputation to the talent and zeal of persons who are too reserved to push themselves forward. Thus Mirabeau would perhaps never have risen to the position he occupied had it not been for the industry of Dumont; and, to come to later times, M. Desages, during the reign of Louis Philippe, was the real Secretary of State for Foreign Affairs, although, as a matter of fact, he merely held the post of head of a department. Such appears to have been the case with Pierre Latour du Moulin; he began his public career in 1815; and, from that period to the Revolution of 1830, he took an active part on the opposition side in political journalism, varying his occupations as writer in the *Constitutionnel* with the composition of a few vaudevilles, which were never performed although they showed considerable talent. The first chapter of Baron Ernouf's volume, which deals with the political and literary part of Latour du Moulin's life, contains some curious letters hitherto unpublished from several leading personages of the Restoration period; then comes a detailed account of his scientific researches on steam navigation, and on the best system for preventing railway accidents. Chapters V. and VI. are devoted to a narrative of the events which occurred between 1841 and 1870; here again documents abound, and Baron Ernouf's monograph is a valuable supplement to the numerous works we already possess on the history of French home politics during the last sixty years.

Few writers have done so much as M. Camille Flammarion to popularize the science of astronomy, and the new volume which he now presents to us ** strikes us as one of his best productions. Its subject is our planetary system. After a short introduction, and a preliminary chapter on the instruments available to modern observers, we have a series of essays in which first the sun, and then the various planets, are examined separately. Notwithstanding the scientific character of the work, the author finds a sufficiently wide scope for conjecture; and M. Flammarion's brilliant imagination revels in the midst of hypotheses on the structure of the planets, life on their surface, &c. The concluding remarks read like an ode in honour of Nature and of the Infinite.

** *Les terres du ciel*. Par Camille Flammarion. Paris: Didier.

It will be remembered that the publication of M. de Montalembert's pamphlet on Spain and Liberty led to a lawsuit instituted by M. de Montalembert's family against the editor of the *Revue suisse*, in which the work had been printed, and against M. Hyacinthe Loyson, who had accepted the responsibility of bringing it before the public. M. Tallichet, the editor of the *Revue*, now gives an account of the trial, and the number for April* contains the speeches of the counsel on each side. This is, of course, the most noteworthy element in the number; but we have also a review of Tucknor's biography, and several other interesting papers.

Under the title *Préface au conclave*† M. Louis Teste has published a little work full of information on the state of the Roman Court, the organization of the Conclave, and the appointment to the Cardinalate. The subject is especially interesting at a time when the election of a new Pope may be regarded as an event looming in the near future. After giving details of a general nature respecting the College of Cardinals, M. Teste opens a kind of gallery in which appear the principal members of that distinguished body, the introductory chapter being reserved for Cardinals Antonelli and Patrizzi, who for thirty years were the faithful advisers of Pius IX., representing, says M. Teste, cunning and piety respectively. Some of these biographies are mere sketches; others go more into particulars, and are enlivened by anecdotes. It is well known that various popular predictions have always been current respecting the election and the death of the successors of St. Peter. M. Teste reproduces some of these; he then describes the present relations between the Papacy and the kingdom of Italy, and ends with a minute account of the Conclave, detailing the circumstances which he considers likely to influence the election of the new Pope. These circumstances may be reduced to three principal ones—1, the composition of the Sacred College; 2, the place of its meeting; 3, the political state of Europe at the time when the vacancy occurs. Will the result of the election be a religious war? Such, says our author, is the problem which is likely to face us at no distant period, and for which we must be prepared.

PI. LAMBE PRICH, Secretary, 21 Old Bond Street, W.

Dinner Tickets, including Wine, One Guinea.

CAXTON CELEBRATION.

Literary Committee.

Sir CHARLES REED, LL.D., F.R.S., (Chairman).

W. CLOVES, Esq., F.R.G.S.

W. SPOTTISWOODE, Esq., M.A., LL.D., Treasurer.

W. Blader, Esq.

John Cox, Esq.

Walter J. Cox, Esq.

George E. Eyre, Esq., M.A., F.S.A.

C. Austin Leigh, Esq., M.A.

R. C. Nichols, Esq., F.R.S.

George A. Spottiswoode, Esq.

John C. Wilkins, Esq.

J. S. HODSON, Esq., Hon. Secretary.

Noblemen and Gentlemen possessing Antiquities connected with the Art of Printing, within the scope of the proposed Loan Collection to be exhibited in the Western Galleries, Exhibition Buildings, South Kensington, in June next, are invited to communicate with Mr. J. S. HODSON, Hon. Secretary, Gray's Inn Chambers, 20 High Holborn, of whom may be obtained the Prospectus containing full particulars.

DR. GEORGE SWINEY'S LECTURER ON GEOLOGY.

THE TRUSTEES of the BRITISH MUSEUM are about to appoint a LECTURER on this foundation. The office is tenable for five years. The stipend is £150 a year. All charges incurred for the delivery of the Lectures are to be defrayed by the Lecturer. The number of the Lectures is not to be less than Twelve in each year, nor more than Three in the same week. The first Course is to be delivered before the end of July, 1877, and each subsequent Course between November 1 and the end of July following at such public places within the United Kingdom as the Trustees shall hereafter approve; the public to be admitted thereto without fee. Candidates must have taken the degree of Doctor of Medicine of the University of Edinburgh. Certificates to this effect, and other testimonials as to qualifications, must be transmitted to the Principal Librarian of the British Museum, not later than November 1, 1877.

J. WINTER JONES, Principal Librarian.

ST. BARTHOLOMEW'S HOSPITAL and COLLEGE.

The SUMMER SESSION will commence on Tuesday, May 1. The Clinical Practice of the Hospital comprises a service of 710 beds, inclusive of 34 beds for Convalescents at Highgate.

Students can reside within the Hospital walls, subject to the College Regulations. For all particulars concerning either the Hospital or College, application may be made, personally or by letter, to the RESIDENT WARDEN of the College. A Handbook will be forwarded on application.

CLIFTON COLLEGE.—ENTRANCE SCHOLARSHIPS.

£25 to £30 a year. Examination begins Wednesday, June 20. A Scholarship may be won by proficiency in Classics or Mathematics or Natural Science, or French and German, with English. Apply to HEAD-MASTER or SECRETARY, Clifton College, Bristol.

KELLY COLLEGE, TAVISTOCK.—The COLLEGE will be OPENED in September next. The Examination of first Candidates for the Foundation will be held August 1877. For information and forms of application for admission, apply to the Head-Master, Mr. W. TAYLOR, Esq., Rugby.

FOLKESTONE.—Mr. W. J. JEAFFERSON, M.A. (Scholar) Oxon., assisted by a Cambridge Honourman and a competent staff of Teachers, prepares for the Universities and for all Competitive Examinations. Pupils successful at the last Nine Examinations of the Line.

THE COLLEGE SCHOOL, STRATFORD-ON-AVON.—Warden, The Rev. J. D. COLLIER, D.D., Head-Master, R. FYNES-CLINTON, M.A., with Eight other Resident Masters. 150 BOYS prepared for the Universities, Professions, Military, Naval, Indian and Civil Service Competitions, and the Public Schools. A Scholarship to Oxford of £40 for three years, annually in October. Terms, 60, 70, and 80 Guineas. Sons of Clergy 10 Guineas less.

BRUCE CASTLE SCHOOL, TOTTENHAM.—Head-Master, Rev. W. ALMACK, M.A. (successor to Dr. HILL). BOYS prepared for the Universities, Professions, the Civil Service, and the Public Schools. For Prospectus, List of Honorary, and for the HEAD-MASTER.

HURSLEY, WINCHESTER.—A. M. HEATHCOTE, B.A., Civil Coll., Oxford, prepares BOYS between Seven and Twelve for the Public Schools. Terms, 60 and 80 guineas. Address, Home Close, Hursley, Winchester.

SUNNINGHILL HOUSE, SUNNINGHILL, Berks.

The Rev. HERBERT W. SNEYD-KYNNERSLEY, A.M., Trinity College, Cambridge (for six and a half years Assistant-Master in St. Michael's School, Aldin House, Slough), assisted by Hugh Fraser-Thurston, M.A., Queen's College, Oxford, for five years Assistant-Master in St. Michael's School, Aldin House, Slough, and one other Master, intends opening, on September 25, a HIGH-CLASS PREPARATORY SCHOOL at SUNNINGHILL.

Sunninghill House, distant about half a mile from the Ascot Station of the L. & S.W.R., stands high, on gravel soil, near Ascot Heath and Windsor Forest.

Boys over Eight and under Fifteen will be received to prepare for Eton, Harrow, Winchester, Rugby, Charterhouse, and other Public Schools; and also for the Royal Navy.

Except in the case of Brothers, every Boy will have a separate Bedroom, arranged on the cubic system.

Inclusive Terms, £150 per annum.

References: The Rev. John William Hawtreys, M.A., Head of St. Michael's School, Aldin House, Slough; The Lord Bishop of Exeter, The Head-Master of Rugby, The Vice-Master of Trinity, Cambridge; Canon Lightfoot.

The Earl of Sandwich, Sir George Warrender, Bart.; Sir John Hartopp, Bart.; C. D. Phillips, Esq., M.D.; Lieut.-Colonel Tremayne, M.P.; M. F. T. C. Sneyd-Kynnersley, Esq., Stipendiary Magistrate of Birmingham; and others.

For Prospectus, &c. apply to the Rev. H. W. SNEYD-KYNNERSLEY, Aldin House, Slough.

EDUCATION (HIGH-CLASS and SELECT).—A LADY

and her DAUGHTER, assisted by English and Foreign Governesses and Masters, undertake the EDUCATION of FOUR YOUNG LADIES, and offer the advantages of a refined and superior home. Terms from £100 a year. The locality is an excellent neighbourhood, in a Midland County. Apply to F. B. care of F. S. de Carenton, Esq., 70 Berners Street, London, W.

LITTLE GIRL.—A LADY, having a large residence with extensive grounds, the situation selected for its healthiness, desires to receive a LITTLE GIRL, or TWO SISTERS, from 10 to 12 years of age, to be educated with her own Little Daughter. A competent Master and Governess, who instruct in all departments of education, reside in the house. No child who has been at a Boarding School can be received. Terms which include tuition and everything but medical attendance, £80 Guineas per annum. Applications to be made by letter, addressed Morning, care of R. G. White & Son, 33 Fleet Street, E.C.

THE COUNCIL of the GIRLS' PUBLIC-DAY SCHOOL.

COMPANY, Limited, will shortly APPOINT a HEAD-MISTRESS for their Clapham Middle School. Salary £200 per annum, with a Capitation Fee of 10s. per pupil over 100. Applications, with copies of testimonials which must be printed, to be sent by May 25 to the Secretary of the Company, 112 Brompton Road, S.W., from whom further information can be had.

EVENING EMPLOYMENT in a LIBRARY WANTED.—By an experienced CATALOGUER, &c. The highest references can be given.—Address, B. Z., care of Messrs. C. F. Hodgson & Son, Printers, High Street, F.A.

WELLINGTON COLLEGE, Sandhurst, Berks.—Educational Privileges.

To be SOLD, a genteel RESIDENCE, the occupant of which has the privilege of sending Sons to the College as Day Boys, at reduced rates. The House is roomy and well arranged, and has a well-stocked garden. Couch house and Stable. Apply to Messrs. WILKES & WAITS, Auctioneers and Surveyors, Wokingham, Berks.

FREEHOLD GROUND RENTS, CITY OF LONDON.

THE COMMISSIONERS of SEWERS of the CITY OF LONDON are prepared to receive TENDERS for the purchase of the VALUABLE FREEHOLD GROUND RENTS and REVERSIONS of the undermentioned Premises:

No. 1. Premises, 14 DEATE CIRCUS, extending from Fleet Street to New Bridge Street, let to Mr. Samuel Sansom, on Building Lease, having about eighty years unexpired, at a Ground Rent of £120 a year.

No. 2. Premises, No. 38, on the North side of the POULTNEY, let to Messrs. Salaman, on Building Lease, having about eighty years unexpired, at a Ground Rent of £75 a year.

Particulars and Plans of the Premises may be had at this Office, together with the Conditions of Sale.

Tenders are to be addressed to the undersigned, at this Office.

The Commissioners do not bind themselves to accept the highest or any Tender.

Sewers' Office, Guildhall—April 26, 1877.

HENRY BAKER, Principal Clerk.

NATIONAL SAFE DEPOSIT COMPANY, Limited.

JEWELS, PLATE, and VALUABLES.

May be deposited for safe custody in the Fire and Burglar Proof Vaults of the Company.

H. WISE, Manager.

1 Queen Victoria Street,

Mansion House, E.C.

FELDE-LANE INSTITUTION, Ragged Schools, Night Refuge, &c.

President, The Right Hon. the Earl of SHAFTESBURY, K.G.

Treasurer, W. A. BEVAN, Esq.

FUNDS are URGENTLY NEEDED to supply the Homeless Poor with Night Shelter, Warm Food, and Clothing, and also to carry on the following important objects of the Institution, viz.: Bible Ragged Schools, Free Night Schools, Male and Female Refuges, Mission to the Laid-off, Ragged Church Services, Servants, Training Home Girls and Boys, Certified Industrial Schools, &c. The Committee appeal with confidence to the Public to aid them in their efforts to ameliorate the sufferings experienced at this season of the year by their poorer brethren. Subscriptions and Donations will be thankfully received through the Bankers, Messrs. HARRIS, BEVAN, & Co., Lombard Street, and Messrs. RANSOME & Co., Pall Mall; or through Mr. W. A. BEVAN, Esq., 14 Lombard Street, and through the Hon. Financial Secretary, Mr. P. H. WILKES, at the Exchequer, Little Sutton Hall, Little Sutton Road, Liverpool. Parcels of old or new Clothing, old Boots, &c., will be most gratefully received at the Institution.

P. PLATT, Secretary.

HYDROPATHY.—SUDBROOK PARK, Richmond Hill.

Physician, Dr. EDWARD LANE, M.A., M.D., Edin. For Invalids and those requiring rest and change. Turkish Baths on the premises. Private equiptage to Richmond Park.

OVERLAND ROUTE and SUEZ CANAL.

Under Contract for the conveyance of the Mails to the Mediterranean, India, China, Japan, and Australia. The Peninsular and Oriental Steam Navigation Company despatch their Steamers from Southampton, for the Suez Canal, every Thursday, from Venice every Friday, and from Brindisi, with the Overland Mails, every Monday.

Offices, 122 Leadenhall Street, E.C., and 25 Cockspur Street, S.W.

HOTELS.

BRIGHTON.—BEDFORD HOTEL.—Facing Sea and

Esplanade. Near the West Pier. Central and quiet. Long established. Suites of Rooms. Spacious Coffee-room for Ladies and Gentlemen. Sea Water Supply in the Hotel.

P. O. RICKARDS, Manager.

"THE GRANVILLE" PRIVATE SPECIAL EXPRESS.

TRAINS to ST. LAWRENCE-ON-SEA, near RAMSGATE, in One hour Forty-five minutes. Departures every Friday, from Claring Street, at 3.45, and Cannon Street, at 3.55 P.M., returning the following Monday morning. (See Bills.) Return Tickets for the Granville Special Express are available for any other Train on the South-Eastern Railway for a week.

"THE GRANVILLE."—"The scenery, the air, the accommo-

dation for visitors were of the most perfect kind."—Saturday Review. "The chief enjoyment, perhaps, to be derived at the 'Granville' is from the baths, for no more complete establishment exists to our knowledge anywhere in England."—London Medical Record. "As a residential hotel second to none."—Globe.

Address the MANAGER, Granville Hotel, St. Lawrence-on-Sea, Ramsgate.

BRIGHTON.—NORFOLK HOTEL.—This old-established

County Family Hotel, entirely rebuilt in 1865, and more recently enlarged, is supplied with every comfort, and in the best situation in Brighton, between the West Pier and the extensive Lavan Promenade. Ladies' and Gentlemen's Coffee Room; Reading Billiard and Smoking Rooms.—GEO. D. LEGGE, Manager.

OLD BOND STREET GALLERIES.—Messrs THOMAS

AGNEW & SONS beg to announce that they have OPENED the spacious GALLERIES erected for them at 39 Old Bond Street, Piccadilly, for the exhibition and sale of their Collection of Works of Art. The business galleries carried on at No. 4 Waterloo Place, is removed to the Old Bond Street Galleries. The Trade and Wholesale Print Department remains, 4 Albemarle Street, Piccadilly.

THE ASTRONOMER-ROYAL Reported to the Admiralty

(August 12, 1870) on 40 chronometers entered for annual competition, M. F. DENIS, the most accurate ever had on trial. M. F. DENIS, Chronometer Maker, 10, Rue de Valenciennes, Paris. The Queen's CLOCKWORKERS, 11, Abchurch Lane, London.

MR. GLADSTONE'S RESOLUTIONS.

AS Mr. GLADSTONE has, for the purpose of reconciling himself with the Liberal party, declined to divide on the Resolution which for several days excited the enthusiasm of the local Liberal Clubs, the House of Commons has properly no issue before it. Mr. CHAMBERLAIN, indeed, who in the first instance complained of the virtual withdrawal of the principal Resolution, was afterwards perfectly satisfied by Mr. GLADSTONE's speech; but it is neither a usual nor a laudable practice to speak on one question and to take a division on another. Mr. GLADSTONE oddly invited the Government to accept his comparatively innocuous motion; and at the same time he denounced them for not treating his first Resolution as a vote of censure. Although it is possible that the entire string of Resolutions might deserve such a description, the Government could scarcely have met with a direct negative a Resolution which is not to be moved. It is, on the whole, a good thing that the split which Mr. GLADSTONE had produced in the Liberal party is patched up; but the excessive awkwardness of the soldering process betrays the difference of opinion which still exists. The preliminary squabble, for which Mr. GLADSTONE is exclusively responsible, might have wearied and dulled a less copious and less impetuous orator; but when the formal debate began Mr. GLADSTONE proved that he had lost none of his accustomed fire. Passionate absorption in a single object, though it is incompatible with impartial judgment, is not unfavourable to impressive oratory; and Mr. GLADSTONE, while his mind was stored to overflowing with facts and arguments in support of his passionate convictions, was extraordinarily eloquent. If the whole matter had not been repeatedly discussed, with the result of settling the opinions of all parties, the House would perhaps for the time have sympathized with his bitter and elaborate invective against the Government and its Eastern policy. It was possible for a moment to forget that the only alternative to peace and neutrality would be war with Turkey. In his fourth Resolution Mr. GLADSTONE would have practically pledged the House of Commons to measures of the same kind with the mission of the fleet which fought at Navarino; but as, for reasons which may have been sufficient, he declined to take a division on this speech, though it may revive or sustain the organized agitation out of doors, was for Parliamentary purposes irrelevant and useless.

Mr. CROSS's answer probably expressed the opinion of the great majority of members on both sides of the House; not is it absolutely impossible that it may influence the division. All but a few zealous partisans on either side are anxious to avoid a collision either with Russia or with Turkey; and Mr. Cross satisfied the House that the Ministers are united in their determination to maintain peace as long as possible. It is difficult to anticipate any contingency in which an attack on Turkey would be expedient or justifiable. The SULTAN may probably continue to govern his own subjects badly as long as any province acknowledges his authority; but the Porte is both unable and unwilling to cause any direct injury or danger to England. The power of Russia is incomparably greater; and the actual or future designs of the Russian Government are highly suspicious. Journals which have within the last two years repeatedly denounced a policy which has, in spite of official contraindications, been finally adopted, now declare that the present war will not end except by the admission of Russia into the

Mediterranean without regard to the obstacles presented by Turkish occupation of the shores of the narrow seas. In other words, the conquest of Constantinople is publicly demanded, while the Russian Government is probably sending assurances to all the Courts of Europe that its intentions, as well as its motives, are disinterestedly benevolent. It is prudent to declare with perfect frankness the occasion in which it may become the duty of England to resist further Russian aggression. Even the hazard of doing some good to the objects of Mr. GLADSTONE's abhorrence must be encountered if it is necessary to defend Constantinople or the Suez Canal. In such a condition of affairs Sir H. WOLFF's motion is little more than a truism. It is assuredly not desirable to embarrass the Government at the present moment with any general instructions, or with proposals of an alternative policy. Mr. CROSS's doctrines are approved by the sound judgment of the country, although they may not satisfy the demands of the organized agitators in provincial towns, who have not yet made up their minds whether they wish for peace or for an unprovoked war with Turkey.

The debate on Tuesday night was comparatively dull and languid; nor indeed would it have been easy to add anything to the indignant denunciation of the Government by Mr. GLADSTONE or to the effective vindication of their policy by Mr. CROSS. More than one speaker censured Lord DERBY for his answer to Prince GORTCHAKOFF's Circular, the real ground of objection being that the document was too conclusive in its condemnation of Russian policy. It can only be judged by the event whether the despatch was calculated to do good or harm. It was desirable to avoid, even on strong provocation, the use of language which might be disagreeable to Russia; and it would have been possible to observe the silence which has been maintained by the other neutral Powers. But Lord DERBY had a full right to protest against Prince GORTCHAKOFF's assumption that the war was undertaken in pursuance of a policy which had been unanimously approved by Europe. It was notorious that the Russian Protocol would neither have been adopted nor considered except under the impression that it was intended to facilitate a peaceable solution. The affectation of citing Lord DERBY's assent to the Protocol as an admission of the justice of the Russian cause was conventional, if not audacious; but in private or national affairs it is not always necessary to tell the whole truth, or to expose every fallacy. On the other hand, it may be said that it may prove convenient to have placed on record the position of England at the beginning of the war. It is true that the plainest phrases may be misinterpreted, as in Mr. GLADSTONE's repeated assertion that the Treaty of Kainardji extends to all the Christians of Turkey the right of remonstrance which was conceded to Russia on behalf of a certain church or chapel at Constantinople. According to some accounts, Lord DERBY's despatch has encouraged the Austro-Hungarian Government to assume an attitude which may have a decisive influence on the campaign in European Turkey. The criticisms of the Opposition on any document of the kind lose much of their weight through the habit, which is becoming inveterate, of finding fault with every diplomatic proceeding of the Government. Even if it is necessary, and therefore right, to give expression to the anti-Turkish sentiments of Mr. GLADSTONE and his followers, systematic opposition to the details of Ministerial policy from day to day can scarcely conduce to the public interest. On Thursday

night Mr. COURTNEY introduced a novel element into the debate by openly avowing a policy from which less courageous politicians have shrunk, even when all their arguments pointed to the same conclusion. He would have actively promoted the dismemberment of Turkey, though he confessed that it would have been eventually necessary to go to war. Mr. COURTNEY anticipated one objection to his proposal by remarking that such a war would not have been arduous or dangerous. To participate first in the insidious plots and then in the violence of Russia would not have been an altogether satisfactory course of action. Mr. FORSTER, on the other hand, made a characteristic attempt to devise a middle course that would enable him to justify the prudent acceptance of a policy which clearly coincides with national opinion, while showing his sympathy for the exigencies of his party.

Perhaps the most important result of the debate and of the negotiations by which it was preceded will have been the disclosure of the wide divergence of policy which separates two sections of the Liberal party. On this question Mr. BAXTER and Mr. LEATHAM differ more widely from Mr. GLADSTONE than from Mr. CROSS; and Mr. CHILDERS only confirmed, by his partial approval of the disputed Resolutions, the well-founded belief that they could under no circumstances have been accepted by himself or his late colleagues. According to Mr. CHILDERS, the third and fourth Resolutions were only objectionable in two or three passages, or rather in a few words; but if his expressions are to be taken in their obvious sense, the ex-Cabinet could have had no sufficient reason for inducing Sir JOHN LAMBOK to move the previous question. Mr. GLADSTONE would not have declined to conciliate his friends by slight modifications; nor would his former adherents have refused to support him merely because the language of his Resolutions was open to criticism. The compromise which was ultimately effected involved on either side more serious sacrifices than those which would have been involved in slight amendments of the Resolutions. Those who are curious in deciphering enigmas may perhaps profitably amuse themselves by studying the reasons which are assigned by Mr. GLADSTONE in his letter to Mr. HOWARD for his singular proceedings. It has often been observed that the excitement of a great occasion has the curious effect of stimulating to the utmost Mr. GLADSTONE'S propensity to subtle refinements and nice distinctions. Other political leaders, if they had adopted the same course in similar circumstances, would certainly have been inspired by the obvious motive of restoring the unity of a party at the expense of a paradoxical device. Mr. GLADSTONE in his letter and his numerous speeches furnished a more elaborate explanation of his policy and of his reasons; and it is but fair to admit that, even when he is most unintelligible, Mr. GLADSTONE is sincere in the belief that he understands his own meaning, and that he is essentially in the right.

THE LIBERAL PARTY.

NOTHING in the history of English political parties is more singular than the phases through which the Liberal party has been passing in the last few days. When war had been declared, the leaders of the party discussed the grave question whether some means should be taken in Parliament to sum up the criticism of the past, and record opinion for the future. It was decided that no step should be taken, as the time for effectual criticism was over, and there was no agreement of opinion to record. But Mr. GLADSTONE refused to be guided by the decision of others. He was bound, as it seemed to him, to take action, although others might sit still. A voice which he believed to be divine whispered to him that he must speak, although others might be silent. He drew up his Resolutions, and was prepared to support them even if a mere handful of followers should divide in his favour. He, as it were, throw his Resolutions in the face of the country, and left it to make what it could and would of them. The consequence was in every way remarkable. Had these Resolutions been the handiwork of the Liberal leaders generally, had Lord HARTINGTON proposed or adopted them, they would probably have gained in the way of clearness and precision, but they would have fallen flat. They would have been treated as only a mere party move, to be checkmated by a party move on the other side. But, as it was, they seemed to be something outside of

party, and to be the utterance of Mr. GLADSTONE to England. They constituted an appeal to popular sentiment, and popular sentiment, without troubling itself in the least as to what the Resolutions meant or did not mean, responded to the appeal. A thrill passed through the hearts of many who are more inclined to feel than to reason. The real issue seemed to them to be whether they would forsake a man whom they believed to be earnest, noble, and true, passionate for right, a preacher of high thoughts, the friend of the poor and the oppressed. They did not inquire whether what he proposed was intelligible, or, if intelligible, wise; but they caught at his central meaning, that a war to shield Turkey from merited retribution was wicked, and they fervently declared that such wickedness should not lie at their doors. Liberalism has always its sentimental side, and without sentiment running in its favour the Liberal party is never really powerful, although in the ordinary conduct of affairs statesmanship is of much more importance than feeling. Mr. GLADSTONE turned his back on Liberal statesmanship and his face towards Liberal sentiment. Few could have anticipated that the effect would have been so decisive. Sentiment reigned supreme, sentiment for Mr. GLADSTONE personally, sentiment against those who seemed to be weaker and more faint-hearted than he was, sentiment ardent and strong against anything like oblivion of the misdeeds of Turkey. Whatever else remained obscure, it became evident that a war lightly undertaken against Russia, so far from being popular, would set one half of England against the other. Statesmanship might hesitate to pronounce whether such a war was expedient or inexpedient; but sentiment as stimulated by Mr. GLADSTONE resolved that such a war would be something monstrous, and insufferably burdensome to the conscience of the nation.

The course taken by Mr. GLADSTONE, and the burst of sentiment which followed it, placed the Liberal leaders in a very distressing position. Those who had served under him had a natural reluctance to separate themselves from a chief of whom they had long been proud, with whom they had long worked, who had often led them to victory, and in whom they recognized a superiority to which they could not aspire. Still, the Resolutions were there, and they could not look at those Resolutions with the eyes of pure sentiment and not call in statesmanship to judge them. A policy was indicated which they could not approve, and it was a matter of plain duty to express disapproval of a policy which they believed to be unwise. They were also bound to Lord HARTINGTON. Some one must lead a party, and they had elected Lord HARTINGTON as their leader, and were perfectly satisfied with their choice. Lord HARTINGTON, with their concurrence, had decided as leader that no action should be taken, and Lord HARTINGTON must be supported or his leadership would be at an end. That it would probably be at an end, however much they supported him, was however obvious. If the majority or anything approaching to a moiety of the party broke away from Lord HARTINGTON, it would have been impossible for Lord HARTINGTON to stoop to lead in name a party that in fact disclaimed him. But the pressure of the constituencies was so strong that many a humble Liberal longing to support his recognized leader would, to save his seat, have followed Mr. GLADSTONE into the lobby. Fortunately the prospect of Lord HARTINGTON'S leadership coming thus to an untimely end dismayed not only Lord HARTINGTON'S friends, but Mr. GLADSTONE himself. He saw to what point things were rapidly drifting. He would have once more to lead; but this time his supporters would be of a stamp that might easily make his leadership very painful to him. He would have been expected to be the champion of a hundred causes which he dreads or dislikes; the champion of disestablishment, of inconsiderate attacks on property, of wild schemes of social reform. For himself, as well as for the sake of his old colleagues, from whom he honestly felt reluctant to separate unless the clear voice of conscience urged the separation, he was willing to make an arrangement by which union might be restored. The arrangement selected was a curious one, but it had one obvious advantage. Every Liberal was able to say exactly what he pleased, and yet all were able, with few exceptions, to support Mr. GLADSTONE. Directly the debate began it became apparent that the real issue was not any one of those which the Resolutions seemed destined to raise, but that which the sentiment of the country had engrafted on the Resolutions. The struggle was not a struggle between the Ministry and the Opposition, nor in any clear way

between the Conservative party and the Liberal party. It was a struggle between two conflicting lines of sentiment, between the sentiment of horror of Turkey and pity for its victims and the sentiment of longing to show the power and greatness of England, and to make its name and influence felt from one end of the globe to the other. Both these sentiments are such as honourable and good men may entertain, and the question was which should prevail in the determination of the present policy of England. As to the result there can be little doubt. Mr. GLADSTONE'S Resolutions, obscure, mangled, and misdirected as they were, have, in a circuitous and almost accidental way, achieved what may be regarded as a success.

That the division which so nearly rent the Liberal party, and which was avoided in a manner apparently so artificial and complicated, has done no harm to the party, cannot, perhaps, be said with perfect confidence; but the damage which the party is supposed to have suffered is probably much exaggerated. That Mr. GLADSTONE, the special man of sentiment of the party, has once more shown his power of awakening the sentiment of a large part of the country in a rapid and decisive way, and that he nevertheless cannot endure to become the mere spokesman of an extreme section, are gains to the party which may be set against the increased difficulties which it may be apprehended will beset Lord HARTINGTON'S leadership. That, when the circumstances were such as to permit every Liberal to speak his mind, wide differences of opinion were found to exist among men sitting on the Opposition benches, is a fact flowing so inevitably out of the constitution of the party that it leaves the prospect of Lord HARTINGTON'S leadership where it was before. Now, however, that it has been once discovered that, if Mr. GLADSTONE'S conscience can be touched, he will throw Lord HARTINGTON overboard, it may be expected that further attempts will be made by those whom Lord HARTINGTON'S prudence discourages and irritates to see whether profitable recourse may not be had to such modes of touching Mr. GLADSTONE'S conscience as may suggest themselves to ingenious and inventive minds. But it is not really the divisions of the Liberals that keep them out of office. It is the good sense of the Ministry. That which, if in office, the Liberals would offer to the country so long as their extreme members were kept decorously in the background, is offered to the country by the Cabinet. From a mere party point of view, the vexatious thing to the Liberals is that the Ministry is, if not consistently, yet in the main and in the most important matters, a moderate Liberal Ministry. The speech of Mr. CROSS was as sound and vigorous an utterance of the thoughts of moderate Liberals as it could have been if spoken on the other side of the House. It was a sort of manifesto to the Conservative party, which accepted it with silent submission, and learnt from it what truths to adopt and what errors to avoid. To the Liberal leaders it must have seemed as if somehow they were in office, and one of themselves was speaking on behalf of a Ministry after their own hearts. So long as the present Ministry preserves this judiciousness of attitude and even balance of mind, it seems difficult to see why it should be replaced, except that all Ministries do somehow fall sooner or later.

THE TRANSVAAL ANNEXATION.

THE annexation of the South African Republic, effected not without a display of force, is an inopportune and untoward event. It may readily be believed that Lord CARNARVON had reason for entrusting a large discretion to his agent; but the character of Sir THEOPHILUS SHEPSTONE affords no absolute security against the commission of an error. The determination to precipitate the measure may perhaps have been justified by facts which are not yet known in England. The latest information which had been previously given was contained in Lord CARNARVON'S able speech on the 23rd of April. It is evident that Lord CARNARVON must have been taken by surprise when he found that annexation was accomplished. "Reports," he said, "had reached this country that Sir THEOPHILUS SHEPSTONE had announced his intention to forcibly annex the Transvaal State. It appears to me that the language ascribed to Sir THEOPHILUS has been grossly exaggerated. His language has been frank, but at the same time conciliatory and temperate; and it has been received in the most

"friendly spirit by the local Government." Lord CARNARVON said, in addition, "I have no desire, if it can be avoided, to take over that State," though at the same time he anticipated that the Transvaal would become a British State. It is of course possible that the imminence of a border war may have accelerated the final decision; but it is to be regretted that the union which may have been necessary was not effected by voluntary cession. According to Lord CARNARVON, one-fourth of the inhabitants had signed a petition in favour of annexation; and Mr. BURGERS, the President, seems to have been convinced of the necessity of the measure. The Volksraad had passed a Resolution "that it is impossible under present circumstances to carry on the administration and control of the country"; but their condemnation of the actual Government may probably not have involved an admission of the necessity of the transfer. The employment of force will furnish the opponents of the change with an inexhaustible argument. The dangers of the present crisis will soon be forgotten, while the advocates of repeal will rely on patriotic jealousy or prejudice.

It appears that the party in the Republic which is chiefly responsible for the late war, and for the confusion which has recently prevailed, refused to pay taxes which had been legally voted. At the same time the Zulu King had amassed a considerable force on the frontier, with the obvious design of attacking the Republic. It might have been supposed that immediate aid would be given on terms which would have secured to the English Government a large influence over the policy of the Republic. Sir THEOPHILUS SHEPSTONE must have satisfied himself that the only mode of securing a necessary control was the direct assumption of the government. The protection which will be afforded to its new subjects by the English Government is too likely to be rewarded by ingratitude; and disaffection may be troublesome even where it is confined to a scanty population. The Dutch farmers will not fail to recall the time when they passed beyond English territory for the express purpose of asserting their independence. If they were exposed to the attacks of native tribes without hope of assistance from the English Colonies or the Imperial Government, they might be more ready to appreciate the advantages of annexation. Lord CARNARVON estimates at a million the number of the natives within the bounds of the Republic; and the Dutch militia has not yet shown its ability to meet a superior enemy in the field. On the whole, it is desirable that the judgment of Parliament and the country should be suspended until the reasons which have induced Sir T. SHEPSTONE to annex the territory are fully stated. Considerable advantages ought to have been attained as a set-off against the inevitable formation of a Home Rule or Repeal party. In time perhaps the English inhabitants of the Transvaal, like the descendants of English settlers in Ireland, may persuade themselves to make common cause with the injured Dutch. It was a mistake to narrow the frontiers of the empire; but the allegiance which was remitted many years ago ought, if possible, not to have been forcibly reclaimed.

The mission of Sir THEOPHILUS SHEPSTONE originated, not in solicitude for the safety of a community which was still foreign, but in the certainty that a native insurrection would extend to all the South African Colonies. The Kaffir chiefs may perhaps not draw minute distinctions between different European races; and, in any event, it would be impossible to stand aside while a civilized State was overrun by savages. It may be conjectured that the malcontents of the Transvaal were bent either on immediate war, or on measures which would practically have produced the same result. Sir THEOPHILUS SHEPSTONE perhaps foresaw the necessity of interference, and he may have thought that subjects would be more manageable than allies. It is also possible that, from his long intercourse with the native chiefs, he may have satisfied himself that the assumption of the Government in the name of the QUEEN would prevent or paralyse the insurrection. The administrator who has long preserved peace in Natal will have great advantages in negotiation with the tribes which threaten the Transvaal with invasion. The proportion of white to coloured inhabitants is not widely different in the two provinces; and it would seem that loyal dealing, combined with firmness, tends to secure the confidence of the natives. The English inhabitants of the Transvaal, forming a not inconsiderable part of the whole population, are naturally desirous of placing themselves under English sovereignty. It

is not altogether a subject of congratulation that in future political controversies the English and Dutch are likely to take opposite sides. Lord CARNARVON, indeed, asserts that the antagonism of the two races is rapidly dying out; but a pamphlet lately published by a Scotch writer, who had oddly adopted all the passions of the Dutch, expresses on their behalf the bitterest animosity to his own Government and country.

Even if Lord CARNARVON on fuller knowledge disapproves of the annexation, he may perhaps find it impossible to reverse the decision of his confidential agent. Many things which ought not to have been done are, in the words of the proverb, valid when they are done. One difficulty which will result from the use of force will consist in the suspicion which will naturally be entertained by the farmers of the Orange Free State. When the President, Mr. BRAND, visited England last year, Lord CARNARVON removed any apprehension which he may have felt of impending coercion. President BRAND and his countrymen can scarcely be blamed if their doubts of the good faith of the English Government revive. The territorial dispute which had for some years caused irritation in the Orange Free State has been amicably settled; but it seems possible that it may be as necessary to interfere with its independence as to take possession of the Transvaal. It is not at present known whether the extension of English dominion will be acceptable to the colonies of South Africa, and especially to the Cape. It is to be hoped that Englishmen in South Africa, as in other colonized regions, cultivate an instinctive aversion to the neighbourhood of any foreign settlement; but it must be remembered that the Cape is as much Dutch as English. It is also possible that Mr. MORTENSON and his colleagues may dislike a measure which probably tends to accelerate confederation. Englishmen at home will chiefly care to be satisfied of the justice of the measure. Notwithstanding the incredulity of foreigners, the national conscience is at least as susceptible as that of any State in the world. In the present case the expediency of the measure is closely connected with the moral apology which probably Sir THEOPHILUS SHEPSTONE will be able to offer and to sustain. If there were no means of providing for the safety of the Transvaal or of the adjacent Colonies, except by superseding the Government of the Republic, compulsory annexation may have been prescribed by duty. If a native war is prevented, the beneficial results of Sir T. SHEPSTONE's measure will probably be obscured by their success. The maintenance of peace may perhaps not everywhere be attributed to its real causes; but no service of equal importance with the prevention of war can be rendered either to the European population of South Africa or to the native races. The Kaffirs are too numerous and too vigorous to be in danger of extermination, like the Maoris of New Zealand. If permanently friendly relations can be established between the races, the experiment of introducing civilization among savage tribes will be tried under advantageous conditions.

EGYPT.

THE speech of Mr. Cross has recalled to the recollection of Englishmen and foreigners how vital is the interest which England cannot fail henceforth to feel in the security of the country which is now her highway to India. Egypt must continue to engross much of the attention of English statesmen. Constantinople, the Suez Canal, and Alexandria are three points of which England must at least control the possession. It is true that, as Mr. Lowe pointed out, Egypt is not in any way threatened at present. Russia has no fleet to carry the war into the territory of the Viceroy. But, of all the dangers to England consequent on a Russian occupation of Constantinople, by far the most serious would lie in the power which Russia would thus gain to threaten our communications with India. It may be doubted whether to England and to Egypt the construction of the Suez Canal has not been more of a loss than a gain. Egypt has burdened herself with debt in order that traffic which used to be sent over her railways may skirt her without paying anything to her needy Exchequer; and, although in time of peace we can send transports to India more speedily through the Canal than by the Cape, the gain is not very great as compared with the passage of troops through Egypt by rail; while in time of war we shall not only have great difficulty in guarding our communications, but we

shall be obliged to see that an enemy does not profit by a thoroughfare from which we are excluded. But the Canal is made, and we must accept an accomplished fact. When, however, we come to consider with a little attention what is the real position thus created for us, we soon find that points suggest themselves which are not a little embarrassing. In the first place, it is almost impossible to see how we can respect a neutrality which theoretically we ought to respect. It is most inconvenient that the road between two parts of the Empire should lie in a strip of foreign territory; but, as this is our road, we cannot help pursuing it. If we were at war with Turkey as an ally or an enemy, there would be no difficulty. In the first case we should ask for, and in the second case we should force, a passage through the Canal. But, if Turkey were neutral while we were at war with a maritime European Power, the Canal ought to be closed to the ships of war of both belligerents. According to accepted doctrines it would be the duty of Egypt, as representing Turkey, to close it. But we could not endure this proper exercise of neutral rights and fulfilment of neutral duties to be carried out in this most exceptional case without running the most serious risk. For, if the enemy did not respect the neutrality of Egypt, and seized on the Canal, he would gain an enormous advantage with very little trouble; and, while we lost our readiest channel of communication with India, he would have this channel at his command. But, when we speak of our guarding the Suez Canal in time of war, how are we to do this? Where is the fleet protecting the Canal to be stationed? and how are sudden attempts to block up the Canal—which, by its nature, could be blocked up with the greatest ease and with the greatest rapidity—to be prevented? The practical answer, we fear, is that the Canal cannot be guarded by a fleet cruising up and down the Mediterranean. There must be a basis somewhere in Egypt from which our arrangements for the protection of the Canal can be made; and this may be assumed to have been the train of thought which led Mr. Cross, when he was mentioning the points where our interests might be really concerned, to include Alexandria in the list.

For the present the Viceroy has had to decide questions raised by the war which are small beside those that would confront him if England were engaged in a war to which his Suzerain was not a party, but which still are such as must have caused him some embarrassment. He had, in the first place, to determine what was to be the position of Russia in regard to the Suez Canal, and he has decided that Russian ships of commerce may use the Canal during the war, while Russian ships of war may not. It was entirely impossible that he could allow ships of war belonging to the enemy of Turkey to pass through his territory, and Russia is not in a position to force a passage. Then, again, the commercial navy of Russia is so small, and a Russian captain would be so mad if he took his vessel through the Canal to be pounced on at its exit by a Turkish cruiser, that the Viceroy could accord this curious kind of semi-neutrality to his Canal without there being any chance that an attempt would be made to take advantage of it. It must have been much more puzzling to the Viceroy to decide what kind and amount of active support he was to give to Turkey. As a Mahometan and as a tributary he could scarcely refuse to do something. But there does not appear to be much Mahometan fanaticism in Egypt, and if the Viceroy felt that he must do something he did not feel that he need do much. To aid Turkey effectually he must have sacrificed the bondholders, and he resolved that his first duty and his primary interest was to maintain his engagements with his creditors. He therefore informed the Porte that he considered all the money appropriated to the service of the bonds as absolutely non-existent for military purposes. The revenues of Egypt, except so far as they are necessary for his own maintenance, are not his revenues. They belong to other people, and are not available for a purpose even so interesting and sacred as that of succouring his territorial chief and the head of Islam. All that he could do was to try whether something more could not be obtained out of the country in addition to the ordinary revenues, and he has thought it possible, by levying an additional and temporary impost on the land, to place half a million sterling at the disposal of his Suzerain. With this money he appears ready to provide a tiny contingent of 5,000 men, and as a proof of his zeal he will send his son HASSAN to command them in the field. Probably the Porte may think that, if this is all that is to be got from

him, his cash would be better worth having than his troops and their Prince. His decision, which cannot be very welcome to the Porte, marks a turning-point in his career. He has passed several years in constant apprehension of being upset by the intrigues or intervention of the Porte. By many shifts, by the use of private influence, and by lavish expenditure in presents, he has warded off the danger which threatened him. He now seeks a new mode of protecting himself, towards the adoption of which he has long been drifting. He opposes the claims of his creditors to those of his Suzerain. He has turned himself into a sort of steward for his English and French bondholders, and he trusts, not unreasonably, that the two nations for whom he is acting will see that an honourable and trustworthy steward shall not be turned out of possession through the caprices of a harem or the vindictiveness of a vizier.

Of the honourable and trustworthy manner in which he fulfils his duties as a steward, and of the good sense with which he regards the acceptance of such a position as perfectly compatible with his princely dignity, the VICEROY has just given a new proof in the settlement which he has sanctioned for the debts of his Daira or private estate. When Mr. GOSCHEN and his French colleague were in Egypt they left this part of the general Egyptian debt unsettled, as time did not permit them to go into all the intricacies attending on a debt of nine millions sterling, charged, not on State revenues, but on private property. They have now been able to arrange terms which the creditors may regard as highly favourable to them, and which strongly testify to the anxiety of the VICEROY to give up to those who have lent him their money all that he could be reasonably asked to abandon to them. His estates, which are very large and of considerable value, with a fair prospect of an increasing revenue if experience proves that sugar can be grown in Egypt to a profit, are to be handed over to an administration, two members of which, out of three, will be appointed by the creditors. But the present revenues of the estates are not sufficient to make a proper provision for the requirements of the debt, and it is obvious that farming is too speculative a source of income for the creditors to rely on, if they are always to get their claims met at the moment when payment is due. In order, therefore, to provide extra funds, and to assure the creditors against risk, the VICEROY has been willing to charge his Civil List with sums amply sufficient for both purposes. This is done partly in response to the appeals made to his good faith, and partly in recognition of the claims which the creditors of his private estate have on him as a sovereign. The accounts of the Daira and the State were so mixed up, and one came so often to the assistance of the other, while the VICEROY borrowed and paid with both sources of revenue at his command, that to have left the creditors of the Daira without any contribution from the revenues of the Sovereign might have seemed a harsh and unfair manner of dealing with them. The main basis of the arrangement now made is that the creditors of the Daira are to receive 5 per cent., with a sinking fund and with other contingent advantages, if the increased yield of the estates permits. Once more, therefore, the VICEROY has exerted himself to do justice to his creditors, and once more he has recognized the principle that European control shall be permitted to operate with its incontestable force in behalf of his creditors. His estates will be mainly administered by Englishmen and Frenchmen; the income of those estates will pass through the hands of Englishmen and Frenchmen, and the revenue of his Civil List will be received and applied by Englishmen and Frenchmen. The feeling in Western Europe has hitherto been that this control of Englishmen and Frenchmen was too good to be true. It was supposed that either it was illusory or that it would not last. That at present it is not in the least illusory is as certain as anything can be. The controllers of the Egyptian revenue get their money paid to them as regularly as the Chancellor of the Exchequer gets the produce of English taxes. They probably do not get all that ought theoretically to come to them, just as the Chancellor of the Exchequer does not get all the legitimate produce of the Income-tax; but the revenues, such as they are, come into their hands. Whether the control will last it is in one sense impossible to say, for everything future is uncertain. But the critical moment for testing the probability of its continuance has come and passed. If the VICEROY wished to regain the control of his money he could not have had a better

pretext afforded him than that furnished by the Turkish war. He has not taken advantage of this plausible pretext. He had to make his choice between governing in his old way and governing in his new way, and he has chosen to stand by his creditors and to subject himself to the control which cannot be very palatable to him, but which he accepts, for better or worse, as the real key to the safety and prosperity of himself and his subjects.

THE RULES OF DEBATE.

THERE was something comic in the interruption by a count-out of Mr. GOLDNEY's speech on those rules of debate which have in the present Session been rudely tested. The Irish members, who knew that their own eccentricities might perhaps be restrained by some alteration in the rules, were equal to the occasion. Although Mr. GOLDNEY possesses both ability and experience, his subject was not lively enough to attract ordinary members, and consequently the Homo Rule party had the pleasure of counting him out. It will probably be desirable to abstain from any hasty attempt to devise remedies for wilful obstruction of business. It is impossible to frame rules which may not be perverted from their object by spiteful ingenuity. All Standing Orders are founded on the assumption that members will loyally and rationally facilitate the conduct of debate. When any rule is abused by being reduced to an absurdity, it seems at first sight easy to guard by special legislation against a repetition of the mischief; but new provisions equally admit of exaggeration and caricature, and the margin of change is narrowed by the necessity of regard to freedom of debate. A limitation of the time allowed to a speaker might be defended by precedents established in foreign Legislative Assemblies, and it would prevent the practice of wilfully talking and reading extracts from documents through the whole of a sitting; but any precaution of the kind might be rendered nugatory by a concerted succession of speeches directed to the same object of baffling legislation and rendering Parliamentary government impossible. Some good might perhaps be done by restraining the power of moving the adjournment of the House or of the debate; but the House of Commons has always protected with wise solicitude the rights of the minority, and it will not willingly be driven into any interference with the traditional and regular practice. The importance of the existing securities against the despotism of numbers is proved by the results of a different system in the American Congress. In the House of Representatives a majority can, by a skilful use of the previous question, prevent their opponents from speaking on a measure which it seems to the dominant party desirable to carry without debate. It is perhaps impossible to suppress Mr. BIGGAR without endangering freedom of speech; and the lesser evil must for the present be borne. It is unfortunate that too much importance was lately given to an offender who, amongst other objects, may probably desire notoriety. Irritation, however natural, is more flattering than the contempt which is said to be capable of penetrating the thickest armour of conceit.

It may be hoped that Parliament, which has surmounted graver difficulties, may survive the attacks of its present assailants. It is not a little remarkable that its authority and dignity should have been so long sustained and increased. One crazy despot has sometimes ruined a dynasty and endangered the principle of monarchy, and among six hundred independent and irresponsible members the chances of intolerable perversity are multiplied; but the House of Commons, though it may sometimes have adopted unwise measures, has been practically unanimous in maintaining the principle of absolutely free discussion; and the community, having few other opportunities of seeing both sides of a question, respects an assembly which is really as well as officially deliberative. One among many causes of the efficiency of the House of Commons is the attachment which is felt by almost all its members to its rules and traditions. Notwithstanding recent changes which may have affected its social character, the House is still the most agreeable of clubs; and veterans who may unfortunately have lost their seats never cease to hanker after Parliamentary associations. Claims of privilege which happen to be in any degree plausible are favoured by all parties, especially if they involve a possible collision either with the Upper House or with the courts

of justice. As the injudicious fanatic said of his sect as compared with his country, members of Parliament are members first, and Conservatives or Liberals afterwards. One of the numerous elements of Sir ROBERT PEEL's unequalled influence in the House was the jealous vigilance with which he guarded its rights and pretensions. Mr. GLADSTONE would be more popular with his colleagues of the House of Commons if he had not the habit of appealing directly or indirectly from Parliament to the country or the multitude. In England, as in France, it is felt that *plebiscites* are incompatible with free and constitutional government. A statesman who is suspected of a tendency to become a demagogue forfeits the confidence of his equals. Representative government, which is justly regarded as the greatest political discovery of modern times, has never been thoroughly understood, or consistently practised, except in England. The essence of the system is that, when an election has once been held, supreme power is vested, not in the constituency, but in the Parliament. Obscure, and perhaps unconscious, conspirators against freedom of debate do their utmost to abolish the best safeguard of liberty.

It is impossible for strangers to form a competent judgment of the value of minute regulations which are thoroughly understood only by experienced members and by officers of the House. It seems at first sight not unreasonable to fix an hour in the night as the latest time at which opposed business can be taken. There is great convenience in securing a vacant time for formal and necessary proceedings; and it had not been foreseen that any section or any single member would habitually give notice of opposition to Bills which were not liable to any genuine objection. If the nuisance is continued, it will be necessary in the present or in a future Session to apply some remedies such as those which Mr. GOLDNEY vainly endeavoured to propose. It is possible that deliberate obstruction may become a permanent evil; and unluckily in civil, if not in military affairs, the defence is naturally weaker than the attack. The enemies of Parliamentary government may compel the House of Commons to restrict the perfect freedom which has been secured by the vigilance of many generations. The disturbers must at any cost be eventually silenced; but they will have attained a part of their object if they have rendered the Parliamentary system less liberal and less comprehensive. The conduct of a handful of Home Rule members may perhaps furnish an argument for simple repeal of the Union, if it is contended that dismemberment is a less evil than the presence of certain Irish members in the Parliament of the United Kingdom. Mr. BURT's federal project, if it were adopted, might perhaps not even abate the immediate nuisance. According to the scheme, if it is to be considered in earnest, there would still be Irish members in the Imperial Parliament; nor would there be any security against their repeating the singular practices which have lately excited indignation. There would be little consolation in the fact that the Irish Parliament was perhaps similarly annoyed; and if the supposed promotion of the cause of Home Rule justifies vexatious interruptions of business, the same methods might be used to secure absolute independence. It is even possible that in course of time other factions might imitate the practice of obstruction, though hitherto even the most bigoted advocates of special measures have been content to allow the transaction of Parliamentary business.

It is not at present known whether the delay which has been caused by vexatious interruptions will tend to lengthen the Session as well as to render it barren of legislation. The time is not favourable to legislative activity, and the Government, in framing the QUEEN'S Speech, tacitly recognized the expediency of doing as little as possible. The Prisons Bill will perhaps be the principal achievement of the Session, for the Burials Bill will, notwithstanding the utility of its objects, meet with strong opposition in the House of Commons. There will be little cause for regret if some of the numerous Committees which have been conceded to the importunity of active members are interrupted by the prorogation before they have finished their labours. Private members will acquiesce with compulsory patience in the well-understood impossibility of carrying any of their measures through the House. It will certainly not be worth while to sit late in the summer for the repeated discussion of delicate questions of foreign policy. It had been hoped that, when war was once commenced, all parties would understand the inutility

and inconvenience of debates which can have no effect in determining the result of the struggle; but Mr. GLADSTONE has thought otherwise, and he has the power of giving effect to his convictions. The controversy which has been revived by the late debate may perhaps be renewed from week to week as long as Parliament is sitting, with the result of absorbing the energies which might perhaps otherwise have been employed in modest experiments of legislation. It is true that the Eastern question is much more pressing and more important than any of the few Ministerial Bills; but, as long as debates on foreign policy continue, there is a risk of rash declarations and a certainty of embarrassing interference with the policy of the Government. The troublesome little faction which occupies itself in obstructing the business of the House of Commons might perhaps perform an involuntary public service if its members could be induced to devote their energies to the prevention of frequent debates on the Eastern question.

FRANCE AND ITALY.

THE debate on M. LEBLOND's interpellation in the Chamber of Deputies has sent the French Ministry several steps further in a direction which it can hardly be to their profit to take. To those who read M. SIMON's speech under the impression left by the furious polemics of the Radical newspapers it seemed weak and one-sided. It was too strong however, and too impartial, for the Left. A Cabinet crisis was in the air the moment the PRIME MINISTER sat down. The Left were determined to put M. SIMON in a minority unless he made an unmistakable declaration of hostility to the Ultramontane party, and in the present Chamber they have ample power to carry out such a resolution. In point of fact, the Left were playing exactly the same game as they played with M. DUBAURE. They know now, as they know then, that the Right are perfectly ready to form a Cabinet whenever they have the opportunity. They know that, in that event, Marshal MACMAHON will once more be in the hands of the Duke of BROGLIE, and that it is very doubtful whether he will be allowed again to get free from them. They know that the effect of an appeal to the country by a reactionary Cabinet might be to send a reactionary Chamber to Versailles; and that, in the more probable event of a Chamber of like complexion with the present being returned, a conflict between the Executive and the popular branch of the Legislature would be inevitable. They know that either of those contingencies would be injurious in the highest degree to the prospects of the Republic. With a reactionary Chamber of Deputies the Constitution would probably be revised in an anti-Republican, if not in a decidedly Monarchical, sense. With a Radical Chamber of Deputies the new Ministry would be almost compelled to govern without reference to Parliament, in order to justify themselves to the country for retaining office against the will of a Parliamentary majority. But their knowledge of these probabilities is not allowed to influence their actions in the slightest degree. Their alarms all point to a danger which, in comparison with those just mentioned, is almost imaginary. They are fearful—at least they profess to be fearful—of a clerical reaction. They cannot sleep in their beds because a foolish bishop has been writing foolish letters, and certain foolish laymen have been putting their names to a foolish petition. They cannot see that, if there is any danger in these proceedings, it is a danger which they themselves have imported into them. If the Government observed perfect impartiality towards both parties, and showed itself firmly resolved to permit no excesses on the part of either, it would matter very little what either did. The great body of the nation, which is equally removed from Ultramontanism and Free-thinking, would be at ease in the conviction that both factions were in the grasp of a hand strong enough to restrain their traditional violence. Whatever strength there is in these letters and petitions lies in this, that the Ultramontanes are able to identify their cause with the cause of religion in general. The Radicals no longer confine their attacks to points on which the Ultramontanes differ from moderate Catholics, or even from religious Protestants. With characteristic thoroughness they go to the root of the matter, and attack the Founder of Christianity as the most certain and comprehensive method of attacking Christianity. The Ultramontanes can insist with truth that it is not they

alone who are the objects of Radical hostility. The other day some of the Radical journals of Paris could not let even M. LORSON escape unharmed. All his quarrels with the Church could not wipe out the inextinguishable disgrace that he professes and calls himself a Christian, and believes that he has a soul as well as a body. It is this state of things that makes the Ultramontane agitation formidable. The Radicals begin by confounding Ultramontanes and Christians in a common condemnation. The Ultramontanes accept the confusion, and insist, with very good reason, that, if the Radicals had their way, it is not only Ultramontanes that would suffer. Whatever may be the exact hold that genuine religious feeling has on the French people, there can be no question that the great body of them accept the Catholic Church as a necessary and convenient institution, and that the prospect of its overthrow by a Radical Government is one that has no charms for them.

If M. SIMON had been as unbending as M. DUFAURE, the tactics of the Left would have had their natural result, and the Duke of BROGLIE would now be Prime Minister. But M. JULES SIMON is pliability itself. If he cannot please the Chamber in one way, he is perfectly ready to try the opposite way. When he found that M. GAMBETTA was not content with a mild repudiation of the Bishop of NEVERS and his allies, M. SIMON was ready with a more violent repudiation. He had no objection to accepting a vote of confidence which bore a remarkable resemblance to a vote of censure. Indeed, it is hard to conceive a form of Resolution which he would not have accepted. It may be said, no doubt, in his defence, that he, equally with the Extreme Left, foresaw that, if he was defeated and had in consequence to resign, he would be succeeded by a Ministry of reaction. This circumstance may be sufficient to constitute a moral justification for M. SIMON'S weakness. But, though it makes his conduct excusable, it does not make it prudent. There are victories which, as far as results go, are not to be distinguished from defeats, and M. SIMON'S victory in the Chamber belongs to this class. What will it avail him to remain in power when it is known to all men that the condition on which he is allowed to remain in power is that he yields entire submission to M. GAMBETTA'S orders? For all practical purposes M. SIMON'S Cabinet is M. GAMBETTA'S Cabinet. M. GAMBETTA has the control of everything, and M. SIMON retains nothing but the responsibility of what M. GAMBETTA does. If this is a position which M. SIMON likes to hold, rather than hold none at all, there is no more to be said. The tastes of Prime Ministers are as unaccountable as the tastes of ordinary men. But M. SIMON might at least have made an effort to avoid it. It is impossible to predict the result of a general election held at this moment under the guidance of the present Cabinet; but, if the Cabinet had had any spirit, it would have tried the experiment. If it had failed, and office was still only to be had on condition of some one else having the power, M. SIMON might have pleaded his respect for the will of the nation, as expressed in the elections. As it is, he can only plead his respect for the will of the Left, as expressed in the vote of the Chamber. But, to say the least, it is not certain that the result of a general election would have been to return as Radical a Chamber as the present. At the last election a reactionary Government appealed to the country to say whether it would have Republican institutions administered by Republican Ministers, and the answer was unmistakable. If M. SIMON had allowed the Left to drive him into a dissolution, a moderate Republican Government would have appealed to the country to say whether it would have Republican institutions administered in a Conservative or in a Radical sense. The disposition to abstain from voting has spread so terribly of late in France, that it is possible that the constituencies would have given no certain answer to this question. But, if they had not done so, M. SIMON'S position would hardly have been altered for the worse.

M. GAMBETTA apparently wishes to see France embarked upon an ecclesiastical war. He burns to introduce a Bill like the one which has just been rejected by the Italian Senate. M. MANCINI has declared during the debate that the safety of Italy depends upon the Clerical Abuses Bill being passed. It is difficult to take in clearly what are the hidden dangers from which this kind of legislation is to preserve either Italy or France. The organs of the Italian Ministry say that the vote of the Senate shows clearly that the Right are becoming a purely clerical party.

It is precisely this circumstance that makes the tactics of the Left so imprudent and so inexplicable. What is the good of throwing all the Conservative force of the country into the arms of the Ultramontanes? Alike in Italy and in France, that force is, and must remain, a very powerful element in determining the policy of the nation, and there can be no greater folly than to make it your enemy without cause. Curiously enough, it is the organs of the Radical party that are most anxious to proclaim that the Pops have been disconcerted by the rejection of the Bill. They do not see that, if this is true, it is the best possible testimony to the wisdom of the Italian Senate in rejecting it. They are so eager for the fray that they are wholly careless of the circumstances under which they begin the engagement. A Radical party which, in the present state of Europe, thinks of nothing but how to make as many enemies as possible is not likely to enjoy power very long.

THE FULLER CASE.

THE correspondence on the FULLER case which has just been published puts the action of the Government of India in a clearer light than it has hitherto been presented in. It is evident that their second thoughts were not quite identical with their first thoughts, or, rather, that the reasons at first assigned for their condemnation of Mr. LEEDS were not quite the same as those on which they ultimately determined to ground their decision. It will be remembered that Mr. FULLER struck an Indian servant, and that the death of the servant followed almost immediately upon the blow. Mr. FULLER was indicted before Mr. LEEDS for causing hurt to his servant, and Mr. LEEDS sentenced him to pay a fine of thirty rupees. The Government of India called the attention of the local Government to the case, and the local Government thereupon took the opinion of the High Court of the province on the adequacy of the sentence. The High Court answered that, as Mr. FULLER neither contemplated nor could have foreseen that severe hurt, much less death, would follow on the blow, the sentence did not appear specially open to objection. Upon receiving this answer the Government of India wrote to the local Government regretting that the High Court should have considered that its duties and responsibilities were adequately fulfilled by the expression of such an opinion; and censuring Mr. LEEDS for not sending Mr. FULLER for trial for the more serious offence of causing grievous hurt or of culpable homicide, and also for evincing a most inadequate sense of the magnitude of the offence of which Mr. FULLER had been found guilty. The High Court of the province did not sit down quietly under this criticism. They denied the right of the Government of India to express either approval or condemnation of their conduct, and they argued that, in censuring Mr. LEEDS, the Government of India had acted in forgetfulness of the provisions of the Indian Penal Code. Under that Code a man can only be convicted of culpable homicide if he has caused the death of another with the intention of causing death, or with the knowledge that he was likely to cause death. Nor can a man be convicted of causing grievous hurt unless he either intended to cause it or used means which he knew were likely to cause it. There was no evidence that Mr. FULLER had intended the death of his servant, or that he knew death was likely to follow upon the blow, or that he meant to cause him grievous hurt, or that he used means which he knew were likely to cause grievous hurt. Consequently, he was properly convicted of simply causing hurt.

The Government of India forwarded the minute of the High Court to Lord SALISBURY, and in doing so they restated their views with more caution than they had shown in their letter to the local Government. We pointed out, when the news of the case first came to England, that those who accused the Government of India of ignorance of the Indian Penal Code forgot the distinction between convicting a man of an offence and sending a man to be tried for an offence. There was one unfortunate sentence, however, in the letter of the Government of India to the local Government, which might be used to show that they themselves had forgotten this distinction. "The GOVERNOR-GENERAL in Council cannot say whether Mr. FULLER would have been convicted of a more serious offence such as that of causing grievous bodily hurt, or that of culpable homicide, had he been charged with it." It is clear from the provisions of the Code that Mr. FULLER

could not have been convicted of either of these offences, supposing that no more evidence had been forthcoming than such as Mr. LEEDS decided to receive. Consequently the GOVERNOR-GENERAL in Council ought not to have been made to express uncertainty as to the result of Mr. FULLER's trial by a superior Court. In their despatch to the SECRETARY OF STATE the Government of India are careful not to repeat the blunder. They say, with truth, that the interpretation which the High Court of the province seems to put upon the Penal Code would confine to the lower and less experienced Court the decision on all delicate questions of law and evidence. The High Court says that a magistrate is to commit an accused person for trial only when he is satisfied that there is *prima facie* evidence of his having committed an offence which, in the magistrate's own opinion, he is either not competent to try, or not competent to visit with an adequate sentence. To this exposition of the law the Government of India take no exception. "The action of the magistrate is to depend on his being satisfied, and on his own opinion." "But a man may be satisfied on reasonable or unreasonable grounds, and may form his opinion with or without care or judgment." Mr. LEEDS had to decide whether Mr. FULLER should be tried before a tribunal which could receive evidence "either of the graver class of crime or of an aggravated instance of the lighter class," or before a tribunal which, for want of jurisdiction, would be incompetent to entertain such evidence. There was some evidence offered at the trial which, if believed, would have given Mr. FULLER's offence a graver complexion than Mr. LEEDS considered it to possess; and the Government of India think that both the evidence and the legal definition of the offence ought to have been left to the judgment of the higher Court.

It appears to us that the Government of India were undoubtedly right in taking this view. They say, with perfect truth, that "the act of illegal violence committed by Mr. FULLER belonged to a class of offences which ought, for obvious political reasons, to receive the fullest, the most public, and the most authoritative examination whenever they occur, by a tribunal competent to inflict upon any offender, whatever his nationality, such sentence as may be found to be appropriate." That absolutely equal justice should be administered as between Europeans and natives; that Mr. FULLER should receive the same punishment, neither more nor less, for giving his servant a blow which was followed by death as the servant would have received if he had given Mr. FULLER a blow which was followed by death; that the law should know, in short, no distinction whatever between the two cases, is of incalculable importance to the good government of India. There is grave danger that when the natives see an Englishman fined thirty rupees for killing his servant—and this, it must be remembered, is how the facts will have been described by and to the native public—they will argue that the law, in spite of its professions, is a respecter of persons, and that Mr. FULLER has got off easily, not because his offence under the provisions of the Penal Code was a slight one, but because he belonged to the governing instead of to the subject race. We do not mean, of course, that Mr. FULLER ought to have been convicted of an offence which he had not committed. But the fact that death had followed upon the blow made it very necessary that the investigation into the particulars of the offence which he had committed should be as full, as public, and as searching as possible. A trial before a subordinate magistrate does not possess these conditions, and Mr. LEEDS ought not to have been content with subjecting Mr. FULLER to such a trial. Had this been Mr. LEEDS's only error, the censure would have been justified, but the delay of promotion which was coupled with the sentence might have been thought unnecessarily severe. But, even if Mr. LEEDS had been right in thinking that it was not competent to him to send Mr. FULLER for trial for the grave offence of culpable homicide or causing grievous hurt, there was another reason why he ought not to have tried the case himself. The maximum punishment for the offence which Mr. FULLER undoubtedly did commit is a fine of a thousand rupees and a year's imprisonment. But a magistrate of Mr. LEEDS's rank cannot inflict on a European any heavier sentence than a fine of a thousand rupees and three months' imprisonment. Under these circumstances, the fact that death had followed upon the hurt caused by Mr. FULLER ought certainly to have been taken into account in determining

whether the punishment which could be inflicted on him by a subordinate magistrate was adequate or inadequate. Mr. LEEDS did not take this fact into account, and here again he was guilty of a grave error of judgment. Nor did the case against him stop here. Having himself the power to sentence Mr. FULLER to a fine of a thousand rupees and three months' imprisonment, he thought him sufficiently punished by a fine of thirty rupees and no imprisonment. Where death has immediately followed upon an act of illegal violence, a fine of something less than 3*l.* is, as the Government of India say, "scandalously inadequate, and in fact purely nominal." Mr. LEEDS's offence is accurately described by the SECRETARY OF STATE as consisting in the circumstance that whereas, having a discretion, he was bound so to exercise it as to discourage the employment of violence to servants and to uphold the sacredness of human life, he did in fact exercise it in a manner likely to bring about exactly opposite results.

MANCHESTER AND THIRLMERE.

WE called attention some time since to a project for making a railway from Windermere through Ambleside and Rydal to Keswick. This ingenious proposal for destroying one of the most beautiful valleys in the Lake district seems in some way to hang fire. We have been on the look-out for its appearance in Parliament, with the full intention of doing anything that came within our power towards ensuring its rejection; but either want of courage or want of capital has kept the promoters unexpectedly quiet. In the meantime the valley in question has not been entirely let alone. It is now threatened by a new danger in the shape of a gigantic scheme for supplying Manchester with water from Thirlmere. This idea cannot be dismissed as promptly as the project of a railway. For the railway no case whatever could be made out. It would be almost as rational to carry a tramway through Westminster Abbey, in order to enable visitors to view the interior without leaving the cars, as to deprive Rydal and Helvellyn of the beauties which make them worth seeing, under pretext of enabling more people to see what is left of them in a shorter time. But the Thirlmere project is put forward under the shelter of the paramount plea of public health. Manchester wants water, and engineers tell her that Thirlmere is the source from which, taking all things into account, water can be most easily brought. It is not contended that the need is as yet a pressing one, or that the proposed scheme is the only one which will give the necessary supply. If these two pleas could be made good, the question would cease to be an open one. Even the preservation of natural beauty, important as it is, must give way to the considerations of life and health which are involved in a sufficient supply of pure water. Neither of these arguments, however, is alleged on behalf of the present scheme. It is only said that Manchester will want water by and by, and that, of all the proposals for meeting this want, the idea of bringing water from Thirlmere is, on the whole, the best. It is open to every one, therefore, to criticize this scheme at his pleasure. If it can be shown that Manchester does not want water, or that it can be got nearer home, a *prima facie* case against the scheme will have been made out. If it can be shown that, amongst the alternative projects that have been suggested, the Thirlmere scheme is open to special objections from which some at least of the others are free, this *prima facie* case will have been sufficiently proved.

Manchester is at present supplied with water from the Longdendale Valley. The utmost amount of water that can be obtained from this source is estimated at 24,500,000 gallons a day. The authors of the Thirlmere project maintain that this quantity will before long be insufficient for the wants of the population. In support of this they point to the increase in the consumption of water during the last four years. In 1873 the daily average was 15,500,000 gallons. In 1874 it was 16,750,000 gallons. In 1875 it rose to 17,000,000 gallons. In 1876 it dropped again to 15,750,000 gallons. This decrease is attributed to the unusual amount of rain which fell during the summer. It is estimated by those who wish to see the Corporation of Manchester committed to the Thirlmere project, that by 1883 the annual consumption will be equal to the largest amount which the Longdendale system can furnish, and on that assumption they plead that it is not

all too soon for the Corporation to be looking out for fresh sources of supply. The advocates of the Thirlmere scheme claim to have only made fair allowance for the growth of population, for the increase in the consumption per head, which more than keeps pace with the growth of population, and for the increasing pollution of the neighbouring wells and streams, which every year makes the customers of the Corporation more numerous. Upon this part of the question it is only necessary to say that, though the future inadequacy of the present water supply may be a good reason for taking time by the forelock in supplementing it, it is not of itself a reason for entering upon so enormous an undertaking as that which the Manchester Corporation are said to have in view. Apparently the Thirlmere scheme is expected to yield water enough for the supply, not only of Manchester, but of many towns on the route. But, with an existing supply of 24,500,000 gallons a day, it seems hardly necessary to do more than make some moderate addition to it. Granting that sufficient water for the whole of Manchester cannot be had nearer than Thirlmere, it does not follow that sufficient water for those parts of Manchester in which the need is, or is likely to be, most keenly felt may not be had nearer. It is asserted by the opponents of the scheme that, as a matter of fact, it is to be had within a dozen miles of the city, even if it cannot be raised from deep wells. Upon this latter point the Corporation will soon be better informed, as the experiment is about to be tried at Liverpool. It seems probable, therefore, that unless the Thirlmere scheme is singularly free from objections, the Manchester Corporation are meditating a needlessly rash fight.

So far, however, is the Thirlmere scheme from being singularly free from objections, that it seems open to at least two of considerable weight. It is not certain that the scheme will be a safe one; it is certain that it will be exceedingly injurious to the beauty of a singularly beautiful district. It is proposed to treat Thirlmere as the principal reservoir for Manchester, and in order to enable it to play this part it is proposed to embank the lake at the Keswick end, so as to raise it 60 or 70 feet above its present level. It is objected to this that the breaking of an embankment is not an utterly unknown event, and that, if this one should break, the destruction wrought by the pent-up water in its course towards Keswick would be incalculable. The people of the district can hardly be expected to risk their lives and property in order to give Manchester more water than it wants. The objection founded on the injury which it is alleged the project would inflict on the beauty of the district is, as has been said, secondary to the objection founded on the risk incurred by the neighbouring inhabitants. But, if Manchester can get drinking water elsewhere, it is certainly better that she should get it at a smaller sacrifice. This seems almost to be conceded by the supporters of the Thirlmere scheme; for, instead of arguing that, so long as Manchester is supplied with water, it does not matter by what expenditure of natural beauty the object is attained, they set themselves to prove that the embankment of the lake will be a positive improvement to the district. They seem to have no conception of beauty except such as depends on pure size. The effect of raising the level of the lake will be to nearly double its length, and, as a necessary consequence, to lay a considerable part of the surrounding country under water. The village of Wythburn would be entirely swallowed up, so that the reservoir would comprise, in addition to the contents of a lake, the contents of a buried churchyard. On the whole, it seems safer to leave the proportions of lake and land as they are, or, if it be necessary to alter them, to do so on the plea of utility, not on the plea that a lake six miles long is more beautiful than one three miles long, or that an embankment can be made by a judicious use of artificial boulders to look better than the natural shore. Some of those who have taken part in the controversy seem indignant that any such considerations as the beauty of the Lake district or the safety of its inhabitants should be mentioned in the same breath with the convenience of the people of Manchester. They will hardly deny, however, that even such trifles as those have a claim to be remembered so long as it is not proved that the convenience of Manchester requires them to be sacrificed. At present it is difficult to see that anything more is at stake than the reputation of the Corporation for readiness to undertake gigantic enterprises. It is even possible that, if

this project is defeated, the ratepayers of Manchester may some day feel grateful to those who helped to save them from incurring so vast a burden. It is not absolutely certain that the present demand for water will go on increasing in a kind of geometrical progression. It is just possible, for example, that the present application of water to sewage may be superseded by some new discovery; and, if so, one of the chief occasions for the use of water would disappear. It is just possible, again, that boring for water may become more general than it now is, and that the Lancashire towns, which the Corporation of Manchester looks forward to supplying with water from their huge aqueduct, may find it cheaper to dig deep wells for themselves, and so leave the Thirlmere water on the hands of its possessors. These may be remote contingencies; but even remote contingencies ought to be taken into account when the object of those who ask that they should be disregarded is to spoil one of the most beautiful valleys in Cumberland, to prepare the way for a disaster of the first magnitude, and to impose a very large outlay upon future generations of ratepayers.

BRINGING BACK THE MASTODON.

TO live in the good old manner of his now extinct family, and to enjoy the comforts to which they were accustomed, the mastodon would require a complete change in the climatic conditions and in the flora of Northern Europe. For these reasons, among others, "Nature brings not back the mastodon," as Mr. Tennyson says, and science has made no attempt to reintroduce him. For practical purposes he would be of no use whatever; and even if he afforded some sport, it is clear that economists would have reason to denounce mastodon forests as examples of culpable luxury. They might well ask why the designs of nature should be interfered with, and an antediluvian and mischievous animal acclimatized, at the cost of the suffering of hardy peasants, and all merely to add to the pleasure of dukes and rich manufacturers. These considerations are so obvious, they present themselves so readily to the mind which for a moment, in reading the Laureate's *Mort d'Arthur*, contemplates the restoration of the mastodon, that no intention of bringing him back has ever been seriously entertained. But in political and private life, in letters and in art, a very great amount of talent and industry and sentiment is always being expended in the effort to restore ideas, institutions, manners, and feelings that are as hopelessly obsolete and as incapable of living in the air of the present world as the animal referred to by Mr. Tennyson.

Perhaps it is because we are an historically-minded generation, and have as a rule been educated to an extent out of proportion to our natural faculties, that we are constantly planning impossible restorations. During the last sixty years the world has had a wider acquaintance with the past than in almost any former period. Scott may be said, more than any one other man, to have made popular the knowledge of a large class of matters which are not only extinct, but more or less fabulous. His influence caused a number of attempts to bring back—not so much the mastodon, which once really did exist, and browse greatly on all green things—as the unicorn, the gryphon, and a number of creatures of fancy. The Highlander of Scott, for example, was not only extinct, but had never been anything but mythical. Yet the effort to revive him, and to preserve him in the atmosphere of the world of gas, electricity, railways, non-resident landlords, and artificial deer forests, was made with great energy and perseverance. The attempt has not even yet ceased, and you may see Fergus M'Ivor displaying his tartans and the nudity of his knees in Princes Street, Edinburgh; while Cullum Beg competes for the prize of piping at the Braemar gathering. By "making believe very much," and by a vigorous effort to forget the fate of the real Highlanders such as they were, this restoration of an extinct ideal is still maintained in existence. It has had more vitality than the restoration of the tournament, which gave a few convulsive struggles when Lord Eglinton tried to galvanize it, and which is now expected to appear again in a debased form, not unvisited with the Oriental diversion of Polo.

So rapidly are these restorations forgotten, so quickly does one stuffed monster of an anachronism appear and take the place of those which went before, that the world only knows the Young England party through the novels of Lord Beaconsfield. Baronial halls, a loyal tenantry, all of them members of a yeomanry corps and ready to sell their lives dearly in defence of the bonny house of Barennes, ladies who were "loaf-givers," picturesque paupers delighted with their doles—a society, in short, restored in the best manner of carpenter's Gothic, was the favourite mastodon of many well-meaning people. As the tournament dwindled into polo, the restoration of Old England dwindled into Old English chairs and tables, and even these have disappeared before the energetic revival of Queen Anne. It is beginning to be discovered that to get rid of plate-glass and put lattices in windows will not really revive the extinct wit and statesmanship and urbanity of that monarch's reign. One might as well try to bring back Mr. Froude's favourite mastodon—the glorious early years of Henry VIII.—by setting up a fresh pair of stocks under

every green tree, branding stray gipsies now and then, and whipping a few tramps once a week on every village green. People may dress like the persons in the pictures of Watteau, and may even use the fans of the period; but the charming refinement and insensibility to human suffering of that age has passed into the antediluvian world. After dressing like Boucher's women at night, ladies are fain in the morning to go into highways and byways where Boucher's women would never have set their fashionable *talons rouges*, and to minister to poverty and sickness which the French models would have passed with an affected shudder. Perhaps even in this work a little of the spirit of revival may be noticed, and the costume of the charitable recalls that of some delinquent order of nuns.

The great age of impossible restorations was, of course, the revival of letters, when ingenious scholars did succeed in being quite as "honestly Pagan" as the ancients, or even more so. Hawthorne, in the *Marble Faun*, has a mysterious character who is believed to be the ghost of some Roman of Nero's time, condemned to wander through the modern world with the secret of a lost sin which he in vain attempts to communicate. A great deal of the work of bringing back the past which went on in the fifteenth and sixteenth centuries reminds one of the amiable enterprise of Hawthorne's spectre. We hear almost as much now as was heard four hundred years ago of reviving the fée, the blithe, the unconscious spirit of Hellas, which really, after all, is a mastodon like the rest, a thing defunct and condemned. Much of the poetry and painting of to-day is a subtle and ingenious evocation of what happily cannot be recalled. "They give and take; the gods cannot restore"; and there is something either strange and unholy or absurd in all conscious restorations. Even the style of the English Bible may be used too much in literature where that style is really a revival, an exotic.

Some time ago it was fashionable in French novels to bring back the spirit of the court of the Valois, and the ladies of fiction tried to experience grand passions in an epic and homicidal fashion. This was not the least certain indication of the fall of the existing order of things, and the end of the Empire. When people could not be in love without a conscious imitation of a remote age which was at least original in its way, there was clearly but little strength left in the imitative society. The immorality of the time was as shaky as the morality of the volatile school of Rousseau. You can't really be much in love if you are trying to be like some one you have read of in a book, any more than you can become truly virtuous by reviving the manner of the state of nature. The author of *Sanford and Merton*, who aimed at bringing back the Spartan virtue of Leonidas and company, went too far back to look for examples. This restoration was so evident an error that even Spartan stoicism in enduring the penal results would be no longer held to ennoble the failing of petty larceny, say the stealing of a bag-fox. There are two difficulties in the way of bringing back anything, however excellent—say the Inquisition, the feudal system, the stocks, the English style of the translators of the Bible—which has had its day, and has yielded to fate. First and most obviously, the new conditions and environment will not allow the old organism to exist. New conditions will beget their own *partus temporis*, their own birth of time, which, young and robust, shoulders the old tottering revived thing out of the way. It may be said by the friends of restoration that the thing revived becomes at least one among the new conditions, and that, though it does not regain its ancient place, yet it does put forth some influence, and exercise some force working in the right direction. But they never can tell beforehand what that force may be, and they ought to remember, when they pick up some fragment of the past they love, and insert it in the present which they do not admire, that the rent will be made worse. The revival will put forth no force so powerful as the reaction from it is almost sure to be—the reaction and the ridicule. That the restorers do not see this is only part of the second opposing influence which makes restorations futile, and, while they last, dangerous. The restorers are, by their own choice, as far as their activity extends, out off from the real, the natural life of their time, and so must daily become more and more incapable of understanding that and of influencing it. At the same time, as they have only been picking and choosing in the past, and have fixed all their attention on their favourite institution, they cease also to understand the true character of the times that are behind us. In reading any of Mr. Ruskin's later works one is constantly reminded of these two dangers of revival, and of wistful contemplation of things dead and buried. It is easy to collect a number of examples of good art and godly life out of the age of Dante and of Giotto, and to insist on the restoration of some such manners and ways. But the more a man's face is turned to these special matters the more the growth and hopeful signs of the moving world escape him, and the more readily he forgets all of his favourite past that does not agree with his views. Thus, to make restoration the activity of a life is not only to attempt an impossibility, but to live in fantasy, imprisoned, like Merlin, "in the most strong tower of the world, neither fashioned of iron, nor steel, nor timber, nor of stone, but of the air without any other thing."

The enchainment power of this fantasy is very much slighter, we find out our mistake very much sooner, when we try to restore something of our own personal experience, when we say "Tomorrow shall be as to-day," or as yesterday. Few people have escaped the knowledge of what it is to attempt to restore the conditions of past happiness. In such or such a place, with certain companions, they have had one of those intervals of calm and com-

plete enjoyment which occupy perhaps about three weeks in the course of the longest and happiest of human lives. Nature, and they, and their friends, and the local cooking, have all conspired to make time pass easily and pleasantly, without a single jarring note from the world outside. The whole experience dwells pleasantly in memory, and they look forward to renewing it. The moment comes when they do return, and find all the external conditions very much what they were. The same friends are there, and the rivers, and woods, and hills, or the sea, and there has been no consciousness of a break in the feelings and affections that made all these things dear and desirable. But the moment and the mood have flown, the selves of two years ago are no more to be restored than the mastodon or the Inquisition, and it is a comfort when the experiment is over. Any one may try the thing without difficulty by reading a book which gave him pleasure when he was a boy, or in love, or unhappy, or in his good days, when things went well with him. Every page is a restoration of himself, but not a pleasant one. The old pang which the poet assuaged will rankle, the old delight which the verse gave will be broken now, and refracted through a hundred memories of the fields that have forgotten our feet, and the faces whose regard is changed. To bring back ourselves is the sorriest of all restorations, and unfortunately is not impossible, like the other efforts to restore extraneous things. On the contrary, the extinct personality insists on revisiting the places where it was at home, and we have more often to exorcise our past than to try to evoke it.

COUNTY TOWNS.

IN the course of the last seventy or hundred years not a few of our county towns have been disappearing. We do not mean to say that one comes upon deserted sites where the ruins of the town-hall and parish churches rise in the wrecks of their more massive strength among moss-grown fragments of slighter masonry; where the fox makes his kennel in thickets of bramble, and the owls and the bats find congenial solitude. Very far from it. But many of these quaint, old-fashioned places have been caught in the rush of accelerated prosperity, and have grown out of knowledge of the worthy citizens of several generations ago, whose dust has been peacefully mouldering near the tablets that perpetuate their memories. The county town, in its general acceptance, was less the actual capital of a county than the popular centre of a district. Thither the surrounding gentry went up on periodical visits of pleasure and business; there they sometimes had town residences which they regularly occupied at certain seasons; and thither their spinster aunts and bachelor uncles would retire in the shady evening of their days to make the most of limited means in the enjoyment of local consideration. There was a time, although now it is somewhat remote, when the pretty town of Manchester on the picturesque banks of the beautifully wooded Irwell was a favourite resort of the Lancastrian magnates; when Newcastle, girdled by its crumbling walls, looked across the pellucid waters of the Tyne to the precipitous green slopes of the opposite Gateshead; when Leeds and Sheffield, and dozens of the basiest of their competitors, lay under skies as clear as you can have in Northern England, and were swept by the freshest breezes from the Wolds. Now nobody would dream of associating any idea of the county with them. Rich merchants and manufacturers have been buying out the surrounding squires. The cities have cast the shadow of their restless industry over a wide range of what once was country. The clouds of smoke from countless chimneys hang like a pall over the languishing verdure. Landowners and farmers pour in the supplies, which are swallowed without a thought by insatiable voracity; but the real business of these emporia lies abroad, and they turn their eyes and minds to the markets of the world. The countryman, whatever his rank and condition, comes as a stranger and foreigner into their bustling streets; and as he gazes at the display in the shops, or wanders open-mouthed among the shipping by the wharfs, he is lost among the crowds with which he has nothing in common.

Happily, however, for the amateurs of the peaceful and the picturesque, the concentration of trade on congenial sites is the safeguard of towns less favourably situated. These change their primitive characters the more slowly that their superabundant energy is attracted elsewhere. Even in the North there are places which lie remote from coal-fields and iron-mines, and which have neither navigable rivers nor the harbours that offer shelter to commerce. In all probability they are destined to remain the capitals of thinly-settled districts that are purely agricultural or pastoral. Yet they rarely lose ground, if they do not gain it, and in spite of the transformations going on elsewhere, they still retain something of their pristine importance. They have still their *assises* and their quarter-sessions. They have their great market days, which are occasions to be looked forward to by the graziers and corn-growers in a vast number of parishes. They have their gale with a respectable number of tenants. In a quiet old-fashioned way they are tolerably thriving, and even make steady though leisurely progress. Possibly there is some small local industry which gives employment to a considerable number of hands; and the masters with their families of friendly workpeople know little of strikes or locks-out. They have one line of railway at least, with a handsome terminus in the outskirts, where the staff is rarely flurried by any scramble of traffic. And their tranquillity and economy,

with their rural attractions, ensure them a certain number of residents, who may not be in the way of running long bills, but whose payments may be relied upon with almost absolute certainty. You know the appearance of that sort of place when you first catch sight of it from some eminence. You may be sure it will be rather prettily situated on the broken ground in a little valley. As you approach it on a fine spring day you see the wreaths of thin grey smoke curling up over the irregular lines of houses, in an atmosphere that only seems the clearer for some streaks of black from the chimneys of the breweries. The square church tower with its venerable buttresses makes an imposing centre point for the eye to rest upon, while here and there a spire or a high-peaked roof is thrown out as a salient feature against the landscape. The town stands on its stream, of course, which you cross by a bridge of considerable antiquity; and the entrance on the other side is by an ancient archway which has been cherished as a relic of departed grandeur. Beyond the gateway is the High Street, a spacious thoroughfare, gradually widening into the irregular oblong of the market-place. Save on very special occasions, things do not look brisk; yet the general impression is of cheerfulness and extreme cleanliness. The sanitary arrangements may be less perfect than they seem, but on the surface there is nothing to shock the senses. The small rounded blocks that form the causeway sink down in a rapid slope to either side, where the rain runs off in open rivulets, which sometimes come down in flood in a thunderstorm. The pavement is of very irregular width, and each house-owner must have laid it down before his door as seemed best in his own eyes. The Corporation does not interfere with the tradespeople, who pile packing-cases and hampers under their windows. But these windows are often of handsome plate glass, and their contents leave little to desire and make a very attractive show; for the place has hardly been touched by the Co-operative movement, and the shopkeepers have all the county for their customers. A pair of steps resting against the front of the "Black Bull" shows that there is one coach at least which starts from that very comfortable-looking hostelry; while the railway omnibus drawn up before the door is being loaded with the baggage of some commercial travellers. The "Black Bull" does an excellent business. It is the resort of all the gentlemen about; one of them is at this moment conversing with the portly landlord while waiting for the ostler to bring round his dogcart. The assembly-rooms are in a wing thrown out behind; and there is a snug apartment on the first floor, which is a subscription reading-room for a select society. As for the farmers' ordinary, that comes off at the "Plantagenet Arms" opposite, and between the two inns stands the market-cross, a massive but graceful monument of antiquity. The town takes a justifiable pride in the grand old abbey church, which has been restored with much liberality and some discretion; and, besides the remains of the cloisters and the city walls, there are some quaint bits of domestic architecture to tempt the artist or the archaeologist. In the way of material well-being there are the square, many-windowed houses with the bright door-plates and knockers, the mansions of the banker and brewer, and the leading lawyers and doctors; while a good number of quaint cottages and showy modern villas occupy more secluded situations among their gardens and shrubberies in the environs.

For the neighbourhood is romantic, or at least picturesque, enough to please strangers of taste; and the grammar-school has a very good reputation with people whose families are in excess of their incomes. The town has a pleasant and simple society, although the shades of social distinction are clearly defined. The newly rich may spend freely if they like, but they seldom care to come out ostentatiously. For they have become rich by saving as much as by getting, and it is no manner of use wasting money in extravagance which only provokes social reprobation. The rector, who is a man of excellent family and made cordially welcome in the best houses around, gives the tone to the fashion, though by no means rich. Even the retired Indians and colonists, who have seen something of the world in their time, and who may possibly have been the petty satraps of departments, are made to feel at a disadvantage with the local aristocracy. The son of a race of squires who have sat on their hereditary acres for some centuries more or less is still a personage. The landlord of the "Black Bull," who is familiar or patronizing with everybody else, is affectionately deferential with him. Hats go off right and left as he strolls along the streets, although the citizens in these democratic days are not much given to saluting. His father's sisters, a couple of prim old ladies who are among the patronesses of all the benevolent institutions and Dorcas Societies in the place, claim precedence everywhere in virtue of their relationship to him. Yet there is a general tone of kindly feeling which softens to everybody the necessity for compromise. New comers are constrained to make a merit, under the rose, of being tolerant of provincial weaknesses which somewhat ruffle their susceptibilities. There is a perpetual round of mild gaieties. Dinner-giving is not much in favour, except among the gentlemen who will be *bons vivants*; and then the entertainments often come off at all sorts of abnormal hours. As you take your walk abroad in the late summer afternoon, you may look in across the railled-in strips of garden, through windows unprotected by blinds, at snug festivities in full progress. If you had the fortune to be one of the invited guests, you would find curdly salmon and early lamb and all the rest of it; and possibly the prolonged symposium afterwards might tax your head if it were none of the strongest. But the odds are that, even if there are ladies in the house, men

would greatly preponderate in the party. For the worthy women take a line of their own, which gentlemen of a certain age are rather shy of following. There are substantial and somewhat early teas, succeeded by light suppers; and there are small early dances as well, at which a good deal of hobble-de-hoy flirtation goes forward. And one of the most entertaining sights of the county town to the man or woman of maturity and experience is the youthful lady-killer in his local splendour, and the girls to whom he devotes himself, with the innocence of their airs and graces. Of course with him and them these premature love passages are but the prologues to more serious life attachments which will come sooner or later; but the proof of his earnestness is in the horrible jealousies engendered by the rivalry of officers, if there should chance to be a garrison. Society in these county towns may be but the caricature or dim reflection of life in London in the season. Rough intelligence shines rather than intellect, and the sensitive over-refinement of fashionable circles might be occasionally scandalized or even shocked. But, on the whole, the lives of their quiet inhabitants must be more enjoyable than well-to-do existence on the average; for the stagnation of their atmosphere has a paralyzing influence on the vanities and ambitions that are the bane of mankind.

THE PATRONAGE OF ST. KATHARINE'S HOSPITAL.

IN reply to Lord Frederick Cavendish, who asked in the House of Commons a few nights ago "whether it was intended to advise Her Majesty to fill up the sinecure office of Master of St. Katharine's Hospital now vacant," Sir Stafford Northcote is reported to have said "that some time ago a Commission was appointed, with Lord Hatherley at its head, to inquire into the position of this institution." He added that "this Commission had made a Report containing certain recommendations," which "Report was now under consideration." This was, as our readers may remember, the Report of a Royal Commission first appointed in 1868, and renewed in 1869, and was published in the summer of 1871, when it was reviewed in our columns. The scheme recommended by the Royal Commissioners for the future administration of the Hospital revenues appeared to many persons, as it did to us, inadequate and unsatisfactory; and an Address to the Queen, embodying these objections to the scheme, was carried in the House of Lords on the 28th of July, 1871, upon the motion of Lord Nelson, who was strongly supported by the Bishop of London. It will be observed that the Chancellor of the Exchequer has not directly replied to the point of the inquiry addressed to the Government; but it is important to notice that the form of his answer implicitly admits the position assumed by Lord F. Cavendish respecting the true nature of the patronage of St. Katharine's Hospital as now exercised by the Sovereign. The nomination of each member of the Chapter of St. Katharine's, it is true, is the Queen-Ragnant's only *pro hac vice*, the permanent right of patronage being invested in the Queen-Consort. But this fact in no way justifies the curious proposition which is occasionally maintained in private society that the "Queen" nominates to this foundation not as Sovereign, but as "an individual." What may be the precise meaning of this distinction we confess that we do not know. "An individual" is a very vague term. Set in contradistinction to the Sovereign, the word might appear to represent an owner of private property; and this, in relation to such an ecclesiastical appointment, we cannot understand at all. The right of *pro hac vice* nomination would seem to correspond exactly with the similar nomination to a benefice vacated by the promotion of the incumbent to a bishopric; the ordinary rights of the legal patron being only for the time in suspense. The patronage of St. Katharine's, as we have already stated, belongs of ancient right to the Queen-Consort. Dr. Ducarel, who drew up his original account of the foundation in manuscript as a kind of wedding present to Queen Charlotte, nearly twenty years before its appearance in an enlarged and by no means more correct form as a tract of the *Bibliotheca Topographica Britannica* series, seems to have been influenced in the direction of courtliness rather than of historical accuracy when he exalts "the great and unlimited power of the Queens-Consorts of England over this small ecclesiastical jurisdiction." Their "power over the jurisdiction" is evidently a flight of rhetoric, as the good Commissary by no means intended to create a feminine Court of Final Appeal; but he states very distinctly that "the Queen Dowager hath no power or jurisdiction when there is a Queen-Consort," referring at the foot of the page to law reports which set forth precisely the opposite doctrine, and confirm the right of the Queen Dowager for her life as against the Queen-Consort, which, considering the history of the re-foundation by Queen Eleanor "in ligna viduitate nostra," is not much to be wondered at. Perhaps Ducarel intended a side shot at the "jurisdiction" of a lady who might have been Queen Dowager at the time had circumstances permitted; or perhaps he had an intuitive perception that his young Patroness would never be Queen Dowager herself; in any case, it may be hoped that in his "exercise of the spiritual jurisdiction" of his Court he was a little more exact than in his occasional statements of historical fact.

The "jus advocacionis sive patronatus dieti hospitalis," the right of advowson or patronage thus vested in the Queen-Consorts, extended, at least from the re-foundation in 1173, over the nomination of the Master, Brothers, and Sisters of St.

Katharine's; but the remaining members of the Foundation seem to have been from the first appointed by the Chapter. The Foundation of Eleanor was completed by ten Beadswomen, and they only, at first, were resident with the Sisters of the Chapter within the Hospital; but the "six poor scholars," a portion of the twenty-four almsmen who were appointed to receive a daily halfpenny, and who were to assist the priests in divine service—"cum a scola vacarent"—seem afterwards to have become regular chorists of the church, and had a "boyes' room" in the college at the Dissolution in 1545. The character of the foundation required of necessity that its domestic arrangements should consist of two perfectly separate parts; and the "ground-plot" of 1781 shows even to the later days of the Hospital the "Sisters' Close," containing the "Sisters' and Beadswomen's Houses" to the south of the Collegiate Church, while the quadrangle and cloisters assigned to the Master and Brothers are on its northern side. Thus the dissolution of the "College" and the preservation of the "Hospital" may very well have been coincident; and it was a part of Sir Thomas Wilson's scheme on obtaining the mastership to show that a Hospital only existed in his time. But the inhabitants of the Precinct as well as the Chapter of the Collegiate Church had rights under the charters, and these rights, both spiritual and secular, their energetic and determined action enabled them successfully to maintain.

As a knowledge of ecclesiastical history and its technical terms is not among the ordinary subjects required for competitive examinations, there is some excuse for Charity Commissioners, and even for Royal Commissioners, if they have fallen inadvertently into the mistake which, in Wilson's mouth, was a deliberate misstatement of known fact. He said that "*Collegium St. Katharine non existit*"; and this, not because it had been dissolved a few years previously, but because the foundation was simply "*ad relevamen pauperum et debiliu mulierum*"; and he contrived by some means to obtain a certificate from Bishop Grindal, stating in the most distinct terms that from the time of Queen Eleanor it had never been anything else than a hospital for poor and infirm women—"quodque in sua hujusmodi originali essentia in presenti existit ac continuatur." Modern Commissioners, into whatever blunders of history or scholarship they may occasionally fall by trusting to second-hand information, are incapable of anything like this; but nevertheless they persist obstinately in calling St. Katharine's Hospital a "charity." It is nothing of the kind. It is a Collegiate Chapter; an ecclesiastical foundation charged with certain alms as a portion of its religious work. The Royal Patroness nominated the seven members of the Chapter; the Chapter administered the alms subject to regulations made, and to be made, from time to time by the Patroness, and appointed or, if necessary, removed, the Beadswomen and others upon whom the alms were bestowed. But the "*originalis essentia*" of the foundation was that of a Religious House to maintain perpetually "the Divine Service of God," as the inhabitants of the Precinct, in direct contradiction to Wilson and the Bishop, declared. It is not unusual now to make a complete separation between the collegiate and the eleemosynary portions of a mixed foundation. Such a division, if we are not mistaken, has recently been made by a new scheme for the administration of the revenues of Sion College; and there the "College" and "Hospital" will in future have separate Governing Bodies and entirely distinct estates. In like manner, it would be quite possible to separate the eleemosynary from the ecclesiastical functions of the Chapter of St. Katharine's, and to make a corresponding division of their estates; but the description of this Royal Free Chapel as a "charity" is about as accurate as would be the application of the same term to the Free Chapel of St. George at Windsor, or to Westminster Abbey itself. The right of advowson or patronage, therefore, which is vested in the Queen-Consort usually, and now in the Sovereign, extends, as we have said, to the nomination of the members of the Chapter, and so far as these are by law spiritual persons, the right is confined within the limits of the ecclesiastical law. The jurisdiction was exempt and peculiar, so that the clergy of the Chapter were not in any way subject to the Bishop of London; but otherwise it is unnecessary to insist on the obvious fact that they were and continue subject to the ordinary laws which govern the Church of England. The number of members in chapter, as well as the number of Beadswomen, poor scholars, and other members of or dependents upon the foundation might be, and indeed was directed to be, enlarged according to the discretion of the Queens of England as the possessions of the Hospital increased. But the secularization of a collegiate church by the transference into lay hands of its entire revenues, or by the conversion to educational and eleemosynary purposes of the funds of a foundation established chiefly for the maintenance of divine service, may be presumed not to be included within the powers reserved by pious foundresses to their Royal successors.

Whatever change in the legal position of St. Katharine's may have been effected by the Acts for the Dissolution of Religious Houses, and whatever mischief may have accrued to the foundation for the time as a consequence, it is certain that its complete rehabilitation, and the restoration of all its ecclesiastical and civil rights on the ancient lines was secured by the charter of Elizabeth, granted in 1565 upon the surrender of the existing charter of Henry VI. The loss of the Fair on Tower Hill, which was not re-granted by Elizabeth, may indeed have vexed the souls of antiquaries, but probably in effect this has simply prevented the existence of a traditional and intolerable nuisance. But the Elizabethan charter supplies the most

absolute and exhaustive answer to the curious statement of the Royal Commissioners in their Report of 1871, that the Hospital never had any local character. All men who did then reside, or should thereafter will and choose to reside, within the Precinct of St. Katharine, were as anxiously and distinctly provided for both by Henry VI. and Elizabeth, as were the Master, Brothers, and Sisters of the Hospital themselves. It is upon the basis of this provision, which in its principle is found throughout the earlier title-deeds of the foundation, as interpreted in its application by the ordinary equitable doctrine of *cyprès*, that the East-end clergy and other residents in the parishes adjoining the Precinct grounded the claim which they first advanced in 1865, and which they are now renewing in the form of a memorial to the Queen praying for its consideration, that the spiritual and temporal needs of the East-end should be regarded in any scheme for the administration of the revenues of St. Katharine's. But, as a preliminary step to the bringing forward of any such local claim, the justice of which we have already emphatically recognized, it is essential that the true character of the foundation, and the nature of the advowsons in the gift of its Royal Patronesses, should be clearly established. The reply which was commonly given in imperfectly informed private circles ten or twelve years ago, when the representations of the East-end residents were discussed, was that, as they could show no legal *locus standi* for their claims, their interference was mere meddling, and therefore no administrative reform was needed in the matter. A more complete *non sequitur* could scarcely be put into words. If the general necessity of reform is shown for any institution, the plea that a particular application of its benefits is not obligatory affords no answer to the question at issue. St. Katharine's Hospital has been proved, over and over again, to be an ecclesiastical foundation not now administered according to its original and true intention; and this position must not be confused with any question as to the justice or injustice of any local claim upon its revenues. Against the confusion of the ecclesiastical character of the Hospital with its eleemosynary trusts, and its consequent description by the common name of a Charity, we have already sufficiently warned our readers. No one who reads the Charters Act of 1840 (3 & 4 Vic. c. 113) with any knowledge of the political circumstances of the time, and of their bearing on the appointment to the mastership of St. Katharine's in the previous year, can have any doubt as to the reference of the 65th section of the Act, which deals with "such Hospitals as were returned as Promotions Spiritual in the reign of Henry VIII.," or can misunderstand the direction that inquiry shall be made into the state of such Hospitals, not immediately, as in the case of all the other Cathedral and Collegiate Chapters named in the Act, but "as soon as conveniently may be." "The Ecclesiastical Commissioners" would seem to have been in something of the mind of Felix thus far, with respect to the "convenient season" for the inquiry which this section of the Act imposes upon them. Perhaps now at last the fitting time may have arrived. The body of the late Master of St. Katharine's has been buried at Kensal Green; where it might have been expected that the last offices of the Church for the head of the Collegiate Chapter would be solemnized by its clerical members, and not left to the unaided ministrations of the cemetery chaplain. But St. Katharine's, Regent's Park, does not appear—it may be by the mere omission of the newspaper reporters—to have been represented at this funeral service at all; while around the grave of the departed Master there did assemble a large concourse of the poor for whose welfare, alike spiritual and temporal, he had cared; a train of mourners gathered not from among the Beadsfolk of Lord Lyndhurst's establishment, but from the courts and lanes of East-end districts adjoining the ancient and still remaining Precinct of St. Katharine-near-the-Tower.

MODERN QUAKERISM.

A RECENT article in the *Daily News* on the changes which have in modern days been gradually taking place in the system of Quakerism has given rise to some controversial correspondence on the subject. The writer of the article, who was stated to be "A Member of the Society of Friends," began by remarking that, while in the course of two centuries many social changes might be expected to occur, no associated body had during that period undergone such a transformation in this respect as that which had happened in the case of his own sect. "The political world," he went on to say, "has changed its front to the body; the religious world, from persecuting, has become obsequious; law no longer curses but blesses the denomination"; and "internally and unnoticed," there has also been a great change going on in the social position of the members of the sect. It may be admitted that, as the writer says, in most religious bodies there is a tendency to drift from the old social conditions; but he is clearly mistaken in citing as an example of this that "the Episcopal body has largely lost its hold on the poor"; for nothing is more conspicuous at the present day than the way in which the Church of England is by its earnest efforts recovering its hold on a class which at one time it rather neglected. It is true, however, that Wesleyan Methodism has, to a certain extent, assumed higher social pretensions, and that other forms of Dissent are also aspiring to a similar position. It is unnecessary here to discuss this aspect of the question in detail; but it is a matter of common observation that there is among Nonconformists

of all kinds a steady and increasing tendency to assimilate their system as far as possible to that of the Establishment. The plain, barn-like construction of dissenting meeting-houses has almost disappeared, and the Gothic style has been very commonly adopted. In many cases, too, passages of the Book of Common Prayer have been embodied in the services; and there is evidently a very general desire on the part of Nonconformists to try to imitate, and put themselves in the same position as, the Church. There is a popular saying that no Nonconformist family keeps a carriage for two successive generations; and any one who studies the subject cannot fail to observe that the jealousy of Dissenters towards Churchmen is more a question of social standing than of religious differences.

Even the Quakers have not been impervious to this influence. As the writer of the article to which we have referred points out, the change in the status of Quakerism "reveals the operation of more than one social current underlying the smooth sea of its outward appearance." One of the most prominent changes in the character of this body which he notices is in the condition of the members. In the early days only a few held influential positions, or such as implied the possession of wealth. Penn was the son of an admiral; Margaret Fell, a judge's wife; Anthony Pearson, justice for four counties; the Barclays and other Quakers of the first period may be reckoned above the middle rank of life; and there were also some others, yeomen and "statesmen," and middle-class people connected with the denomination. But a large proportion of the adherents belonged to the working classes, as is shown by the early records of the Society, where there are many references to "labourers," "websters" (weavers), hinds and farm servants, "taylors," skinnners and glovers, wine-coopers, cordwainers, in the chronicle of the early Leeds Friends. In 1680 in two hundred and fifty marriages, all the men belonged exclusively to the mechanical and shopkeeping classes, and there was not a single banker or anybody in the list. A hundred years later, in the same number of marriages, there were seven bankers, six doctors, and the merchants had increased, while the mechanics, labourers, cowkeepers, and so on, had fallen off. The Society has now almost ceased to recruit its members from the artisan class; but, on the other hand, there are not many of the richest sort of people in the sect, and the writer we are quoting thinks that the bulk of the members are of the middle class, including representatives of most of the trades. The same authority also quotes evidence to show that in their early period the Friends were by no means so strictly bound over to plain costume as afterwards. The founder, for example, bought for his wife a "piece of red cloth for a mantle," and as much black Spanish cloth as would make her a gown. Coloured stuffs were, in fact, then the common wear, and cost about 14s. a suit; and the Friends had no objection to brilliant colours, either in dress or other things, for we read of bedsteads with "printed curtains." It was not till later on when the early members of the body were passing away that the question arose as to the enormity of men imitating the "world in their extravagant periwigs or nodes in their apparel," and "women in their high-towering dresses, gold chains, or gaudy attire." Then it was that the sect began to be exercised in mind on such matters, and to enforce a severe restrictive discipline for the purpose of enforcing uniformity of costume. All this, however, is said by the writer we have quoted to be now passing away; and, though he thinks the doctrinal position of the body has not altered, there is an end of the Ishmaelitic position which the Quakers used to occupy in the eyes of other denominations.

To this article a reply soon after appeared in the same paper, in which "An Old Member of the Society of Friends" challenged some of the statements made in it. It was not correct, he argued, to represent the early Friends as following the fashions of the world in dress in contradiction to their profession of using "this world's goods for comfort and propriety." The "Old Member," however, himself admits that there have been in modern days serious changes in the manners of the Quakers. The term "lady," he says, was never used among them; they were called according to the good Apostolic fashion "women," but now all are "ladies." Again, he asserts that the faith of the Society does not remain unaltered, but that "every well-informed member knows that it has been substantially altered and controverted in the writings of several deceased ministers of recent date, and their errors accepted by many, which one yearly meeting has confirmed by endorsing such as 'worthy of double honour' whilst living, and at death by a public testimony to the consistency of their lives." "Truly," he adds, "within the last sixteen years such fundamental changes have been made in our discipline and former Church government as to enable the new faith to develop, and we are now confronted with practices which completely ignore our true Christian testimonies in regard to worship, ministry, &c. The present social phase which the writer boasts of is the offspring of many departures from the faith of our forefathers, who could not be bought by the blandishments of this world, nor allured by its pleasures; and the social parties we now hear so much of are respectable gatherings of the worldly element." There is, further, a letter from Mr. W. Tallack, who is also a member of the Society, in which he declares that the assertion as to its faith being unaltered is too positive and unqualified, for "it is a matter of notoriety that Barclay's *Apology*, the once time-honoured exposition of the Society's doctrines, has long since been virtually and officially set aside by the refusal of the standing Executive Committee of the Society to reprint or re-issue it." The same charge of Friends having departed from their old ways holds good, he

says, as to practice:—"The Friends, as a body (though not yet in a formally official capacity), support an active missionary organization with permanently established and paid ministers. As a body, again, they have abandoned the old 'testimony' of their fathers against music. Pianos and songs are now to be heard in the homes of the Friends generally—of ministers, elders, and the flocks under them. The church 'discipline' also is almost wholly lapsed. Formerly Friends were promptly 'disowned' (excommunicated) for practices now of frequent indulgence. The dance, the theatre, the hunting-party may be (and are) now attended by some Friends without any inquiry or official comment."

On the whole, then, there can be little doubt that, whatever may be the case as to their doctrines, there has been a great alteration in recent years, at any rate in the external manner and dress of Quakers, many of whom have thrown off all the outward distinctions to which their predecessors used to attach such importance. The number of Quakers who are to be distinguished from other people by their costume or manner of speech would seem to be continually declining. At Croydon, Dorking, and other favourite haunts of Friends, the drab clothes, and broad-brimmed hats for the men, and close poke-bonnets for the women, may still be seen in a certain proportion; but it is a small one. Even at the May gathering in London there is no longer to be seen those Quakeress lilies, of whom Charles Lamb speaks as "whitening the streets." Here and there there may be a few of the old types; but it would seem that the open marks and badges of Quakerism are dying out. It may be that, as is pleaded, the solid essence of the system remains substantially preserved; but in other respects Quakers and Quakeresses are becoming very much like everybody else; and this is only the natural result of a process which has long been going on. If we look back through the records of the Society, we find how constantly there was a difficulty in keeping up the old formalities and rules, and how many wayward sheep were disposed to leap over or butt down the barriers. For instance, in the Rules of Discipline of the Society there is a clause, under the date of 1703, condemning "the excess of apparel and furniture," and all extravagances in colour and fashion, as a crying evil of the day. In 1753 it is lamented as "a matter of exceeding grief and concern" how far that exemplary plainness of habit, speech, and deportment which distinguished our forefathers is departed from by too many under one name. In 1732 it is observed with sorrow that, "contrary to the repeated advice given against an inordinate pursuit of riches, too many have launched into trades and business above their stocks and capacities, by which unjustifiable proceedings, and high living, they have involved themselves and families in trouble and ruin." A warning is also given that "speculation of any kind which may seem to hold out the prospect of a rapid accumulation of wealth greatly endangers tranquillity of mind." Again, in a book published in 1851 by "a lady who for forty years was a member of the Society of Friends," there are illustrations of the irksome discipline as to dress, and the disposition of the victims to evade it. The writer was blamed because the hem on her plain muslin collar was too broad, and she had to rework it to the breadth of a straw; her shawl was bound with narrow ribbon, and of course it had to be replaced with a broad one; and the gathers had to be taken out of a bonnet, and plaits put in. Another time the overseers called to remonstrate against lessons from a drawing-master, and also against a French lesson, as "Friends might be tempted to say things in French they would not say in English." In Ireland, this writer says, "hairbine, stuff, and tabinet were once the approved materials for dress"; but "the women preachers now wear silk, and perhaps few ladies moving in fashionable circles of life can boast of a greater number of silk dresses, or of more costly fabric either, than they whose colours are confined to either drab or any dark shades of purple, brown, and green." We also hear of Quakeresses who, while conforming to regulation colours, go in for luxurious materials, such as caps of India muslin at a guinea a yard, and gowns of the richest and softest French silk. It may be regarded as a good thing that the Friends should have so far shaken off these foolish and fanatical restraints, and become more liberal and tolerant in regard to the rest of the world; but the truth is that the position which they assumed of an elect and isolated body was one which could not be permanently maintained. They could not keep clear of the society around them, and having, after all, only mere human nature as the basis of their character, they were influenced by the ways of the majority. At the same time, apart from the eccentricities and absurdities of which the class were once so enamoured, there is a right sort of Quakerism—a temper and habit of mind not peculiar to their body, but an element in all systems of religion and morality—that of self-restraint and moderate life; and, while the Quakers on their side are becoming like other people in their external appearance and manners, it may be worth while for the latter to catch something of the spirit of their discipline and reserve.

THE CAXTON CELEBRATION.

THE approaching Caxton celebration, like other celebrations of the kind, labours under a number of disadvantages. Its object is doubtful. Its origin is doubtful. And it has had the ill fortune, which of late years has attended but too many similar enterprises, of being picked up by South Kensington. It was in-

telligible enough that the printing and publishing folk who live and labour near Stationers' Hall should hold an exhibition of printing and books where they and their operatives and their customers might visit it. It was appropriate enough that this exhibition should be held in the four-hundredth year from the first dating of a book in England. And if any profit accrued from the show it might well be applied to the benefit of the Printers' Pension Fund. But when the managers resolved to remove their celebration to South Kensington, they changed the whole complexion of the undertaking. If they expect a profit, they expect what many there have looked for before, and have uniformly failed to find. If they expect crowds of visitors, they will probably be disappointed. Nurserymaids and children in perambulators cannot make a concourse, and the better classes in Brompton like flower shows and concerts, but care nothing for black letter. The magnificent collection of engravings in 1874 was almost entirely neglected by the public, even though it was held in the Museum, which is infinitely more accessible than the galleries round the Horticultural Gardens. The printers no doubt will attempt to visit this exhibition. But from Paternoster Row and Fleet Street to South Kensington is a Sabbath holiday's journey. They may go once; but the exhibition is, we hear, to be held in the West Galleries, and it is not likely that many will brave a second time the toils, and thread the mazes, of that labyrinthine nest of museums, galleries, gardens, hard gravel, and dust. Then, again, no one who remembers the exhibition of bindings held in the South Kensington Galleries three years ago can have the slightest confidence in the arrangement of the books. As to catalogues, they will probably be "under revision" until the end of the exhibition, and be untrustworthy at best. We are assuming that the catalogue and other arrangements will be carried out in their old fashion by the local officials. The princes and nobles of the earth who decorate the lists of South Kensington Committees may be able to secure the services of competent bibliographers; but, as a rule, such people are as proud in their way as lords and dukes, and are not very anxious to perform unpaid work where all the credit goes to a Royal Highness.

Things may be better managed on the present occasion, and our gloomy anticipations may prove mistaken; but the fatal step of going to South Kensington at all will go far to defeat the probable purpose of the promoters of the celebration. Granted that Stationers' Hall was not large enough, there was a building even more suitable, by situation at least, than Stationers' Hall. It is large, airy, accessible, practically empty, and has a qualification by which every other site in Middlesex is superseded; it stands on the very place, or within a very few yards of it at most, where William Caxton four hundred years ago first set up his press. It may not be too late yet for the managers to seek accommodation in the Aquarium—odd as are the associations which the name unluckily suggests. Considerations of local fitness are clearly in favour of such a change. The Dean, who likes to look upon himself as the successor of Abbot Eteney, would be a near neighbour. The grave of the Prototypographer of England, to give him his full title, is within two hundred yards of the spot, and the half-empty building would almost seem to have been preordained for the purposes of this celebration. The exact situation of the famous "Reed Pale" is not accurately known. A house in the Almonry was known as Caxton's until its fall in 1846; but it had certainly been built more than a hundred years after his death. It may have stood on the site of an older house. But there can be no doubt where the Almonry was. Mr. Blades suggests that Caxton rented his house under the Mercers' Company, of which he was a member. The Company had lands at Westminster, held, like all other lands in St. Margaret's parish, under the abbot; but Mr. Blades would make his connexion with the abbot and abbey to begin and end here. Abbot Islip, whose name so often occurs, through a mistake of Stow's, as that of Caxton's chief patron, was not elected till after his death. He once mentions in a prologue that Abbot Eteney "did do shewe to me late certeyn evidences"; but there is nothing to prove that they came into personal communication—a supposition which, indeed, the words seem specially to guard against. Caxton at Westminster, in short, was in the position of a retired woolstapler of means, returned from thirty-five years' residence in the Low Countries to spend the remainder of his days in employment which to him at least must have been more an amusement than a business, which he conducted with the care in minor matters which so often characterizes amateur work, and which afforded him scope for his talents as a writer both of prose and verse. This appears to be Mr. Blade's view of Caxton's position. He only took to printing in his declining years. He only survived his return from Bruges at most fifteen years. He seems to have worked with prodigious energy both at the press and in the study, and he certainly contrived before his death to make the art he had brought over both well known and also popular among his countrymen. By the end of the fifteenth century, Klood and Machlinia were printing at Oxford, the celebrated schoolmaster at St. Albans, and a "chapel" of young printers had been trained under Caxton's own care to carry on the art. Westminster was soon deserted. Caxton's successor, Wynkyn de Worde, dated his colophons for a few years from the house in the Almonry; but in 1499 he removed to Fleet Street, where, at the "Golden Sun," in the parish of St. Bride, he prospered and died rich. Of the exact date of Caxton's death we have no direct information. By a series of careful inductions his latest biographer has fixed it for the end of 1491, when he was seventy years of age. He had undertaken a

translation of the *Vitas Patrum*, which his successor published with the note that it was "fynysshed at the laste daye of hys lyff." He was buried in the churchyard of St. Margaret's; and, according to the churchwarden's accounts for 1490-2, there was paid—"Item, atte Bureyng of William Caxton for iiij torches," 6s. 8d.; and, "Item, for the belle atte same bureyng," 6d.; from which Mr. Blades infers that the deceased was of great consideration in the parish.

But the Caxton celebration relates, not to the printer's death, but, as we have said, to the date of the first book printed in England. Until recently this was supposed to be the *Game and Play of the Chess*, and Caxton's device or trade-mark, adopted towards the end of his career, appears to be a 7 and a 4 interlaced, and was thought to commemorate the date and fact. But Mr. Blades has conclusively proved that the chess book was translated in 1474, when Caxton was at Bruges, and that it was about a year, or probably some time in 1476, before he returned to England. Colard Mansion, his teacher, seems to have printed a French version of Lefevre's *Recueil* of the history of Troy, which has usually been attributed to Caxton. This makes him, and not Caxton, the first French printer. It would be strange indeed if the honours of prototypography should belong to our Kentishman in both countries. The French, as might be expected, have made violent efforts to claim this *Recueil* for a French printer; but undoubtedly it was printed at Bruges, and either by Colard Mansion or William Caxton. The first book printed in English was a translation of the same *Recueil*, which Caxton finished in 1471, for the Duchess of Burgundy, the sister of our Edward IV.; and, as there was considerable demand for copies at the ducal court, Caxton learned, as he says, to ordain in type for the purpose of supplying them. The book was enormously popular for many years after his time. As lately as the beginning of the last century an edition was issued. Although it related to the Trojan wars, Caxton had no intention of forgetting the contemporary strife among his countrymen, and draws a moral in his conclusion which we may almost imagine Mr. Gladstone or Dr. Schliemann using to adorn a speech upon the excavations at Hisarlik:—"And I most humbly pray unto Almighty God that the example of these cruel wars and desolation of this famous city may be a warning to all other cities and people to flee adultery and all the other vices, the causes of wars and destruction; and that all christians may learn to live godly and in brotherly love and concord together: amen." But the *Recueil* was wholly printed at Bruges, and it was not until November 1477 that the *Dictes and Sayings*, "late translated out of French into English by the noble and puissant Lord Antony Karl of Rivers, lord of Seales and of the Isle of Wight," bore the imprint of "me william Caxton at westmestre." In 1480 a book is dated "In thabbey of westmynstre by London"; and about the same time he issued an advertisement in which he invites all men "spiritual or temporal" who want "pyes" of the Salisbury use to come to "westmonester into the almonesrye at the reed pale" and they shall have them good cheap. Whether the *Dictes and Sayings* was really the first book printed in England or not even Mr. Blades seems uncertain. There is no doubt it was the first printed with a date, and if Caxton did not settle in England till 1476, he would not have had time to do much, if anything, before it. About a dozen copies have been identified, and some of them will appear at the coming exhibition. One, in Lord Spencer's library, has a colophon in which the 18th of November is mentioned as the day on which the printing was completed. Four copies only are known to be perfect, one of them, that in the British Museum, having been made up of two fragments. All Caxton's books are now very scarce and valuable, even imperfect copies. Since 1819 twenty-seven of his works have been discovered, of which the very title of seventeen had been unknown. He printed in all about a hundred different volumes or editions, of which ninety-four have been identified, some of them having been picked out of pasteboard bindings and other hiding-places by the indefatigable searches of the modern book-lovers. A perfect Caxton is almost invaluable. A vellum copy of the *Speculum Vitæ Christi* of St. Bonaventure cost the trustees of the British Museum no less than a thousand guineas some ten or twelve years ago. A *Doctrinal of Sapience* on parchment is at Windsor Castle, and in the town library at Bedford there is an Indulgence granted by Sixtus IV. for aid against the Turks, also on parchment. Such examples are of the greatest rarity. There are eighty Caxtons in the British Museum, and some fragments, about a third of them duplicates. Lord Spencer has even a better collection; for though it only comprises fifty-six books, forty of them are perfect, and there are no duplicates. Cambridge comes next with fifty, and the Bodleian with forty-one. Thirty-three of his books are only known by unique or fragmentary copies, and the greatest number of copies of any one work is only twenty-nine. The famous copy of the chess book of which Scott's *Antiquary* tells as having been bought by "Snuffy Davy" for two grochen existed only in the fertile imagination of the novelist. The *Fifteen Oes*, a collection of prayers in English, of which only one copy remains, is perhaps the most comely specimen of Caxton's work; there is a border round every page, and several woodcuts; but it would have embittered his declining years could he have foreseen the so-called facsimiles of this and some of the other books which the celebration has already called forth.

MR. HARRISON ON DISESTABLISHMENT.

MR. FREDERICO HARRISON has published in the *Fortnightly Review* a lecture on "Church and State" originally delivered before the Liberation Society. It is marked throughout by the earnestness, the eloquence, and the ingenuity which are characteristic of the writer. But the constant oscillation between arguments drawn from the principles of Positivism and the ordinary platitudes of the Liberationist platform—which, however impressive, are too familiar by this time to stand greatly in need of repetition—produces an effect which is a little bewildering, not to say grotesque. It is sometimes difficult to feel sure how far the lecturer is expressing his own inmost convictions, and how far he is adapting himself to the prejudices of weaker brethren among his audience, while at other times one is haunted by an uneasy doubt as to how far his audience would agree with him. He begins indeed by stating that "the simple question before us is the principle of Official Religion"; but he nowhere definitely explains in what this simple principle consists, and he immediately proceeds to observe—in strict accordance no doubt with the Comtist system, but hardly, we should imagine, with the views of the Liberation Society—that "to make too much of a plea for equality would but little accord with my political convictions." Religious equality, however, is precisely what the Dissenters are clamouring for; religious liberty has long ceased to be an available grievance with them, except in the highly ideal sense in which the Pope is said to be a prisoner. With the Dissenters indeed, as such, it is difficult to suppose that Mr. Harrison can feel any very warm sympathy, although for the nonce he was—to cite language which has become classical, if it can hardly be called correct—"keeping company with his Festus Chamberlain and his Drusilla Collings." For the Church of England, whose liberation from State control he is pleading, he professes a far higher regard:—

All my associations have been with the Church; I have been educated within it by its priests and teachers; from boyhood I have been familiar with its spirit. Many of its ministers are and many have been amongst my friends; for not a few I have a lively feeling of admiration; with many I have on social questions the bond of common sympathies. With all that is mainly and hopefully in the spiritual life of the Church we may honestly profess a genuine fellowship. Let us give it full measure of our tribute for all that it retains and for all that it can record, whether of learning, of culture, of largeness of temper, saintliness of life, devotion to its social mission, and real imaginative aspiration for a simpler and a wider future. If any man choose to deny that it still has a part in English civilisation (I speak of it solely as a spiritual body, with hope still latent in its inmost conscience); if any man choose to deny that it still counts within it some of the finest natures of our time—I am not that man, nor with that man. Least of all can I forget, surrounded as I have been with its spiritual influences, the promises of development which it holds, for they are amongst the most rational, the most humane—I would rather say the most human—of the manifold influences of Christendom.

We are far from desiring to question the sincerity of this eloquent appeal, but an appeal it is manifestly intended to be—and a very skilful one—to the well-known sympathies of an influential section of English Churchmen. It was stated the other day by one of our weekly contemporaries that more than a thousand clergymen have joined an association formed under Mr. Mackonochie's leadership for promoting disestablishment. We quote the statement, which has since been reproduced by the *Guardian*, without vouching for its accuracy. But Mr. Harrison must have been well aware that, when he complains of the Church being treated as "a political bureau," and inquires whether an official religion is not vicious in principle, and when he asks how long Churchmen "will endure to see religious life thus vulgarized by a compact which forces devotion into the attitude of a parasite, and turns the voice of the preacher into the grating tone of a State official," there is a diplomatic ring about his indignant queries. The Liberation movement is already receiving, if not "its critical impulse," substantial encouragement "from within the Church itself," and "sincere Churchmen yearning for the enlargement of their hopes" are exclaiming, whether wisely or not, loudly enough against "official dictation and political manipulation." Nor can we reasonably complain of an outsider making the fullest use for his own purpose of a line of argument which is passionately, and no doubt honestly, urged by a section of those within. It is not unfair to suggest that those who defend the existing Establishment merely on the ground that "the residuary legacies" will be either, as Archbishop Tait argues, the Church of Rome, or as others fear, "Infidelity, Materialism, Atheism, and so forth," are not paying it any very high compliment; and Mr. Harrison, for one, refuses to say anything so dishonouring to the communion in which he was brought up and in which he sees new life; he has too much respect for the traditions which its clergy, "from St. Augustine to Keble," have inherited. And it is a neat, and to some minds a convincing, mode of putting the dilemma to say, "If it is a living spiritual energy, it will live in a healthier way without Parliamentary prerogatives; if it cannot live without them, it deserves to die." Still less will a devout Anglican be likely to acquiesce in the very equivocal defence—borrowed, we presume, from the Establishmentarian champions of the *Pall Mall Gazette*—that "the Church of England consists in this accretion of statutory privileges." It is obvious of course, as the lecturer points out, to meet such a plea with the taunt that not only the Free Kirk of Scotland and the Roman Catholic Church in England, but the very Mormons and Shakers contrive to maintain their position without such adventitious aid. But all this, however plausible, or undeniable, from a religious point of view, does not touch the real

ground of Mr. Harrison's contention. He is arguing, not as a Churchman, but as a citizen, that "it is a source of evil in the State that the political force of the Government should be able to buy the partisanship of a religious community, and with the common property or revenues of the nation give factitious ascendancy to a faith in which a minority alone believe." The words we have italicized appear to us irrelevant. Nearly the whole argument of the essay would be equally applicable if a majority or the whole body of the nation accepted the established faith. But let that pass.

Mr. Harrison's fundamental principle—which is far from being a novel one—is that the proper office of the State is not moral, but purely material, "to protect the lives and property, to insure the material convenience, of the citizens." That is a perfectly intelligible and perfectly tenable view, and is no doubt accepted by the Liberationists. We are not equally clear that it is consistent with Comtist orthodoxy. If that ideal commonwealth or Utopia to which Comte looked forward were ever to be realized on earth, we had always understood that "the wise and good" were to reign with absolute power. It would of course be a highly enlightened and beneficent despotism, but not the less a despotism, or rather—we were going to say a theocracy, but the etymology of the word recalls a central idea which Comtism desires to banish; let us say then a religious despotism, for Mr. Harrison himself has lately assured us in the "Modern Symposium" that "we shall come to see our Morality transfigured into a true Religion." But whether the purely material view of the functions of the State is or is not consistent with Comtism, the essayist's next assertion is flagrantly inconsistent with fact. And we cannot help wondering that so acute a reasoner should have encumbered himself with a plea which cannot be maintained, and is quite unnecessary for his argument. The State, he tells us, "can act only in material ways, by preventing deeds; it cannot act in moral ways, by inducing convictions or forming qualities. It cannot even compel actions which it approves; it can only punish actions which it condemns. It imprisons a wrong-doer; it cannot reprove his conscience." If for "cannot" we substitute "ought not," the theory Mr. Harrison supports would be adequately stated; if we leave "cannot," but insert and italicize *directly*, the assertion would be literally accurate, but would not help the argument. All States do a great deal, rightly or wrongly, to induce convictions and form qualities, and can hardly avoid doing so. It is contended, if our memory serves us, by the author of *Ecco Homo*, that most men's notions of right and wrong are actually, though not consciously, based much more on the law of the land than on the laws of God. Be that as it may, one or two very simple illustrations will suffice to prove our point. Does any one doubt that the high value attached to human life in England as contrasted with other countries is largely due to the severity with which murder is punished? Or, again, is it not clear that the disproportionate importance attached to crimes against property, as compared with crimes of personal violence short of murder, is due to the extreme—we do not say excessive—severity shown in punishing the former, and the entirely inadequate chastisement too often inflicted on the latter class of offences? One of Mr. Harrison's critics has suggested another illustration of the same fact, which he would probably claim as supporting his general argument. Half the English Episcopalians, it is argued, believe in the necessity or utility of bishops, because they are appointed by the State. It may be so, though the essayist would no doubt reply, So much the worse for the Episcopalians whose belief is based on such a rotten foundation, and so much the worse for the bishops who cannot vindicate the necessity or utility of their office without such extraneous support. Broadly speaking, his contrast between statesmanship as a matter of "compromise," and religion as a matter of "ideals and principles," is a just one. It is a further question whether the confusion between the two on which he so eloquently descants is necessarily involved in the maintenance of an Established Church, which is thought "to work well" by the wary politician and the "business-like bishop," when the clergy discharge the useful but inglorious part of an efficient "social police." In referring to the Minister of the day as "the real head of the Church of England," and in the following carefully drawn indictment against the *status quo*, the lecturer is again evidently bidding for the support of High Church Liberationists, whom indeed he appears throughout to have had more constantly in his eye than his Nonconformist audience:—

It is hardly a generation since Parliament entirely recast the whole scheme of Church property by the Ecclesiastical Commission, redistributing a vast proportion of its revenues and the duties of its functionaries; it is only the other day that this present Parliament amidst violent opposition passed an Act which wholly reformed the discipline of the Church; and it is now engaged in founding new bishoprics. Well! the House of Commons (and in this country we have long been accustomed to look to that House as the sole seat of power)—the House of Commons which does these things can hardly show a majority of English Churchmen. If we subtract the Irish, Scotch, Nonconformist, Catholic, and Jewish members, there will be a very narrow majority of members of the Anglican Church, and many of these are avowed opponents of an Establishment. And it is certain that of the constituencies which return that House a majority are not adherents of the Anglican Church. But Churchmen or not, the point of importance is, that these constituencies practically name the Minister and the Government who govern the Church of England, as completely as the Pope and the cardinals govern the Church of Rome.

We cannot follow Mr. Harrison through his amusing but not very complimentary criticism on the defensive argument of Mr. Freeman, who "has been lecturing about the Church of England

as if the English public were an old almanac, and as if mediæval history were the sole reality extant," and of another distinguished writer, already referred to, who "supports the official religion with all the pretty enthusiasm of an *abbé* of the last century," and, while "professing a superb detachment from the Christian verities, makes *vers de société* upon the Trinity, and tries to apologize by *bons mots* against Dissent." But the curious thing is that, after all this elaborate expenditure of argument, eloquence, and denunciation, we do not get from first to last any distinct explanation of what disestablishment means. Does it include disendowment? We are all agreed, Mr. Harrison says, that "an Established Church with its privileges, its ascendancy, and enormous possessions" must be kept in bondage to the civil power as long as it is allowed to exist at all. But "ascendancy" is a social quite as much as a political question, and wealthy endowments may grow up, as most of the property of the Established Church in fact has grown up, from private munificence. Then, again, the English people are said to be irrevocably resolved—the italics here are the author's—"that a Church which is trusted with official authority, and maintained by public endowments, shall never be a free Church." The public endowments, however, are endowments originating from royal or individual gifts guaranteed by public law. Are they to be—we are cautioned against talking of confiscation, but are they to be taken away? The essayist seems to answer Yes and No. There are passages implying, if we rightly apprehend their drift, that "the glorious abbeys and cathedrals," and the rectories and vicarages—which may be thought to carry the parish churches with them—are to be left to the disestablished Church, and it is expressly stated that churches built by existing congregations are not to be meddled with. We are certainly far from saying that if the Anglican Church were to be disestablished to-morrow it might not fairly claim at least as much as this, but it is by no means clear that such a concession is compatible with the general drift of the argument, and still less is it obvious that the Liberation Society would assent to it. Moreover a disendowed Church may acquire fresh endowments, and Mr. Harrison broadly hints that it would be a lasting disgrace to the members of the Church of England if it did not do so. And thus we might have the "enormous possessions" and the "ascendancy" they bring with them restored to the disestablished Church. The writer will perhaps reply that the Church of England has no claim to retain property designed for Roman Catholic uses, and this is apparently what is meant by speaking of her as "endowed by converted confiscations," and having "quietly usurped her vast possessions." But then he puts the Gallican Church of Bossuet and Fénelon into the same boat with her, and considers the position of the Russian Church to be worse than either, and in these cases there has certainly been no such "conversion" or "usurpation." Mr. Harrison states his case, which in its practical drift is that of the Liberation Society, with great ability; but we are left to desiderate in his argument a fuller exposition of how far the process of disestablishment is to be carried, and what securities are to be found, consistent with the maintenance of religious liberty, that those incidents of an Establishment which he denounces as civilly prejudicial—and "this great issue must be decided by politicians on strictly political grounds"—might not be reproduced or even aggravated, sooner or later, in "a free Church."

THE ROYAL ACADEMY.

11.

THE arrangements made for the reception of the crowd which at ten o'clock on the first day of public exhibition rushes to the doors of the Royal Academy are more curious than satisfactory. It is ingeniously contrived that the mass shall break itself up into two divisions in the entrance hall, one seeking to deposit umbrellas on the left, the other searching for change or catalogues on the right. This may be all very well, but the subsequent meeting of the two divisions pressing their way upstairs is not so well; and confusion is worse confounded by the presence of an opposing stream of people who have mounted the stairs but have not provided themselves with change, and are coming down again in an unhappy condition to seek it. It may seem trivial to dwell on such matters as these, but one cannot help thinking that the flurry and impatience thus produced are not conducive to an artistic frame of mind. When one has escaped these dangers and sufferings and reached the first gallery, the attention is, as we last week said, forcibly drawn to Mr. Millais's "Yeoman of the Guard" (52), but it is not likely to rest there with any great pleasure. The fact of the picture being by Mr. Millais is enough to warrant its possessing admirable technical qualities; and there is perhaps no other painter who could have dealt so boldly with the glaring mass of scarlet which fills the canvas. But, however much we may be struck with the painter's mastery of his mechanical means, it is difficult to believe that they have been well employed in producing so unpleasant an object as this scarlet costume, which is worn by a gentleman who looks supremely unhappy in it, and to whose face the painter has imparted a strangely disagreeable colour. It may be convenient to speak at once of Mr. Millais's other works instead of taking them in the order in which they occur in the rooms. Turning to "Yes," in Gallery No. V. (409), we find a young man in a caped Ulster coat with a travelling cap in his hand and an umbrella and portmanteau hard by, holding the hands of a girl in black, who looks up into his face, and has presumably just given him an

answer which will defer his journey. The girl's face has a strange and unlovely appearance of rouge and powder about it. In its expression there is a beauty from which the attention is unpleasantly distracted by the faithful rendering of the accessories of umbrella and portmanteau, which are not beautiful, and make the picture look as if it might be a magnified version of an illustration to a modern novel. It is no doubt a faithful representation of such a scene as might occur at any moment; but a painter of Mr. Millais's power might, one would think, be at more pains to elevate his subject. The same painter's landscape, "The Sound of Many Waters" (273), in Gallery III., represents a stream rushing down a valley to fall over a ridge of rocks which fills the foreground. The painting of this foreground is minute and masterly; but with the general effect of the picture it is difficult to be much pleased. The water is strangely hard, and seems in some parts to want motion. The picture is wanting in what may be called suggestiveness; it is a reproduction, for the most part accurate, of many things in nature, which do not seem to have aroused any imaginative feeling in the painter's mind. There is no such sense of sympathy with the varying moods of sky and stream as one may fairly look for in a landscape by a great painter. Mr. Millais is represented at the Grosvenor Gallery by three portraits (25, 26, 27) and an illustration of Hood's "Song of the Shirt" (28), in the West Gallery. The two portraits of the Countess Grosvenor and Lady Beatrice have the same chalky look which is observed in the girl's face in "Yes," and which has led to the not inapt remark that the artist seems to have used dentifrice instead of paint. The head of Lord Ronald Gower (27) is painted in a manner more masterly than either these or the "Stitch, Stitch, Stitch" (28), in which, again, there is a want of imaginative force.

The West Gallery at the Grosvenor Gallery is the most important in this respect, that one end of it is occupied with the works of Mr. Burne-Jones, a painter hitherto little known to the public. Mr. Burne-Jones, as we have already said, has taken a line exactly opposite to that which seeks for technical excellence before everything. He has aimed at the expression on canvas of high poetical emotion, and in some instances, in attaining this, he has sacrificed accuracy of drawing. His inspiration has come, it would seem, from various painters of a bygone age, among whom Sandro Botticelli has perhaps had the most direct influence on his work. It might be well if the painter had been content to follow the poetical instincts of an older school without adopting the eccentric drawing noticeable especially in hands and feet which belongs to the master we have named. But it is much to get a picture so full of expression in the highest sense as "The Beguiling of Merlin" (59), even though the figure of Vivien is utterly impossible. The scene is in the Forest of Broceliande, beneath the shade of a white hawthorn. Merlin, whom the painter has shown without the long beard generally associated with him, has just waked from sleep to watch, helpless, the woman who has beguiled him with his own enchantments, which, standing up in front of him, she reads and watches their effect the while. There would be much to admire in her face and attitude could one shake off the unpleasant impression caused by the false drawing of her figure. The attention centres, however, on Merlin's face, in which a variety of passion is caught with great power. The deep eyes tell with infinite tragedy how Merlin found himself in a tower fashioned "of air without any other thing, and, in sooth, so strong it is that it may never be undone while the world endureth." In the painting of the hawthorn bush Mr. Burne-Jones has shown that he is thoroughly capable of technical excellence, and it is a pity that he should not apply this capability to his figures. "The Days of Creation" (60) is a set of six pictures, with angels' figures, increasing from one to seven, holding the globe of the earth, in which, in the sixth of the series, the figures of Adam and Eve appear; here one grows weary of the ceaseless repetition of the same type of face—another method which the painter might have left with advantage to the old school. It must be said, however, that the type is one of considerable beauty, and there is something very pleasing in the scheme of colour. Of the figures which hang above—"Spes," "Temperantia," "A Knight," and "A Sibyl" (66)—the last is, to our thinking, the finest. It is unfinished, but in the pose and the arrangement of drapery the painter has caught much of antique beauty. "Venus's Mirror" (61) is a group of girls kneeling or standing round a pool which reflects back their figures with somewhat too great distinctness. In aiming at transparency the painter has overshot his mark, and made the reflections look like substantial figures without any water above them. Here, however, there is beauty of composition and colour; and we must hope that Mr. Burne-Jones may continue to paint and exhibit pictures containing more of his finer qualities and less of his eccentricities. Of pictures in the same school hanging near we may speak hereafter. Meanwhile, to see grandeur and beauty of imagination combined with fine execution unspoilt by any affectation, one need only turn to Mr. Watts's "Love and Death" (23) on the opposite wall. The tall figure of Death hung with solemn drapery passes sadly and majestically into a house, while the boy figure of Love tries vainly to bar his progress. The design is charged with a noble pathos, and the execution is worthy of it. The same room at the Grosvenor Gallery contains certain productions of Mr. Whistler's to which reference was made last week. Mr. Whistler has chosen to christen these "Nocturnes," "Arrangements," and "Harmonies"; and he has certainly done wisely in thus suggesting that they are anything rather than pictures. We are asked to accept as a representation—it is not called a

portrait—of Mr. Irving as Philip II. a long, smudgy, black figure, standing on nothing, with indistinctly shadowed hands, above which appears a ghostly head peering painfully through the surrounding gloom. The two frames which hang on each side of this contain certain marks of paint which also are presumably intended for portraits, though one is called "An Arrangement in Brown" and the other "A Harmony in Amber and Black." They have, however, apparently no legs or feet, and they are enveloped in the same smoky and smoky atmosphere which surrounds the phantom of Mr. Irving. Below these are four canvases called "Nocturnes," three of which are covered with blue of a delicate and pleasing tone on which are black marks and gold or silver dabs that stand for boats, bridges, and lights. This style of art, which is the very quackery of painting, would appear to be singularly easy, although it is said to be the result of infinite pains. It would not call for any detailed notice but that Mr. Whistler has proved in his etchings that he is capable of serious artistic efforts. Even in these strange follies one may discover evidence that the hand which produced them is far from being without cunning. Mr. Whistler, however, has deliberately chosen to affect these monstrous eccentricities, secure of admiration from a clique which prides itself upon possessing artistic perceptions too fine for common understanding. And as long as misguided people can be found to go into ecstasies over "Harmonies in Smudge," so long, we suppose, will Mr. Whistler go on producing them.

Returning to the Royal Academy, we find in the first room Mr. Oulless's "Portrait of Miss Ruth Bonvériot" (13), which is not one of the painter's happiest efforts. He seems to have aimed at the delicacy and brightness of Gainsborough, but the result is cold and hard. Mr. Dicksee's "Harmony" (14) is a mediæval scene; a girl playing an organ, while a young man, evidently much in love, leans towards her with a rapt expression. The light comes in through a painted window, across the lower part of which is drawn a crimson curtain. Both in drawing and colour there is much excellence, and possibly the conventional aspect of the whole thing may be only a sign that the painter has been wise enough to assure himself that he can walk before attempting to run. Mr. Marcus Stone's "Sacrifice" (51) suffers much from being hung next to Mr. Millais's overpowering "Yeoman of the Guard"; and to this fact may perhaps be set down the unreal look of the flame consuming the letter which the graceful girl, who is the chief figure, burns. Near this is a bright and pleasant sketch called "After a Gale: Seaford Bay" (55), by Mr. W. H. Mason. Mr. Walter C. Horsley has two pictures (44, 62), in the second of which, "The Hour of Prayer on Board a Turkish Ironclad," there is considerable reality, which is carried too far in the accurate representation of a pair of shabby boots just taken off, and lying close to the porthole of a big gun, around which sailors are grouped in prayer. Mr. Pettie's "Hunted Down" (28), a half-naked Highlander leaning, sword in hand, against a rock, is somewhat hard and theatrical, and is far inferior to the same painter's "A Sword and Dagger Fight" (203), in Gallery No. III., which is full of vigour and animation. In this two adversaries, one clothed in deep black, the other in white satin, relieved with a touch or two of pink, are engaged in a conflict which is evidently deadly. The glare of the man in black, seen over his guard, is fiendish, but has no terror for the other, behind whom lies a dead snake, possibly emblematic of the coming result. There is great dramatic force in the picture, and the textures of the dresses are admirably painted without being too obtrusive. The last picture in the first room, "The Old Pump-Room, Bath" (69), by Mr. G. A. Storey, is singularly pleasant and pretty. Mr. Storey has given to his picture an excellent effect of atmosphere; and in the groups which fill his spacious room there are many touches of delicate humour. The people are full of animation and gaiety; in the centre a lady just stepping out of her chair is clearly looking forward to joining the throng, receiving admiration and hearing the latest gossip. In the right-hand corner a tiny little girl, following the universal fashion, administers some of the water to her doll. The colour is quiet and pleasant to look on. We must only regret that Mr. Storey has not given more finish to many of his faces, which are merely indicated instead of painted.

RACING AT NEWMARKET AND CHESTER.

WHEN the race for the One Thousand Guineas was run on the Ditch mile, it was proverbially one of the most uncertain events of the season; and now that the course is changed to the Rowley mile its character remains unaltered. In consequence a large field may generally be looked for; for, in proportion as the issue of a race is doubtful, the number of the competitors increases. Owners do not care to expose their horses to certain defeat, and when a race is, or seems to be, absolutely at the mercy of one particular animal, or of two or three out of a large entry, the opposition becomes contracted within narrow limits. Here and there an owner may run his horse on the off-chance, or because he likes to see his colours represented in the race; but, as a general rule, more practical considerations carry the day. The money prizes for the second and third in a race are seldom worth taking into account, nor is it often possible to support a horse for a place for a stake which in this mercenary age is deemed satisfactory. To run second in a big race, especially in a big weight-for-age race, is therefore not only a barren honour, but one which

is frequently attended with disadvantages. The second in the Two Thousand or the Derby is not forgotten by the handicappers, and if an outsider happens to run into either of those positions the cry is forthwith raised that a Cesarewitch or a Cambridgeshire has been thrown away. The horse's merits have been unnecessarily exposed, and in grasping at a prize beyond his reach he has sacrificed other prizes which he would have had a fair chance of attaining. On this account, in proportion as handicaps have risen in favour—principally for the sake of the handsome profit that can be made out of them—weight-for-age races have gone down. Many of the old-fashioned events of this class, for which Newmarket used to be famous, are now nearly extinct; and even the historic races which still maintain their position and reputation by no means attract entries or fields in proportion to the increased number of horses in training. Many a good three-year-old is kept in his stable on the Two Thousand day for fear lest by some chance he should run well enough to attract the handicapper's notice, though not well enough to win; and even this year there was a sort of chorus of lamentation over Brown Prince and a big handicap thrown away. We do not think, however, that the running in the One Thousand is watched by handicappers with equal care. The race, as we have said, is looked on as one of the most untrustworthy, as well as the most uncertain, of the year; and the only thing in connexion with it about which it is safe, four years out of five, to make up one's mind, is that the form will be assuredly upset later in the season. Hence, as on the one hand nearly every filly that happens to be fit and well on the day possesses something more than an outside chance, and on the other the attainment of second or third place furnishes no proof of superior racing merit, there is more than one inducement to owners to send their representatives to the post. And this year there was an extra inducement, because both Lady Golightly and Palm Flower, two of the most prominent public performers of last season, were understood either to have lost their form or to be unfit to run at the present time; and, indeed, Lady Golightly had been withdrawn two days earlier from the Two Thousand, for which her owner considered she had no chance. Accordingly no fewer than nineteen runners came to the post on the One Thousand day, the field including, in addition to Lady Golightly and Palm Flower, such fair second-class fillies as Helena, Miriam, Dee, Plaisante, and Morgiana, whose performances will be found recorded in the *Calendar*, but are hardly worth enumerating in detail. Not one of these, however, finished in front, and only Lady Golightly came to the rescue of public form and succeeded in gaining the third place after a close finish with Belphebe and Lady Ronald. This pair a day previously would hardly have been ranked in the third class. Indeed, on the Tuesday in the First Spring week, Belphebe had been beaten in a canter by Tassel and Spiegelschiff, and Lady Ronald had finished behind Grey Friar. So, although every one was prepared for the victory of an outsider in the One Thousand, the surprise was not looked for from this quarter. How Lady Golightly has deteriorated was shown by her failing to get nearer than third to animals to whom last year she could have given two stone; and though she may perhaps do better at Epsom, she has evidently seen her best day. Palm Flower's case seems still worse, for she was never formidable at any part of the race. The Oaks now bids fair to be an uninteresting event, though a large field of mediocrities may assemble to compete for it. Placida, who at Lewes beat Chamant, Chevron, Shillelagh, Palm Flower, and Dee, seems far in advance of any three-year-old form yet shown by the fillies; but if any accident has happened to her, or if she too has experienced the fate that has fallen on Lady Golightly and others, then the Oaks will be as open a race as the One Thousand.

The general racing of the First Spring week was of the most ordinary character. Those old opponents Skylark and Coltness had yet another battle together, and this time the contest was over the Cesarewitch course. Skylark was giving 3 lbs., and Coltness, according to custom, took a long lead in the hope of cutting down his opponent. This lead he maintained to the bottom of the Abingdon hill, where Skylark closed with him, but, stumbling at the same moment, the race seemed lost. Coltness tired so much, however, up the hill that he could not retain his advantage, and Lord Falmouth's horse gradually wore him down and won a very creditable victory. The Prince of Wales's Stakes over the Rowley mile fell to Tassel, the One Thousand fillies Spiegelschiff and Belphebe occupying second and third places. The gallop seems to have agreed with Lord Hartington's filly better than with Lord Zetland's; for in the One Thousand, as we have seen, she left Spiegelschiff far behind. It is worthy of notice that on the Two Thousand day the French horses won four races in succession, including the grand event of the week. We fear these repeated victories will increase the jealousy shown towards foreign-bred horses by a considerable number of English sportsmen; and if Chamant makes a clean sweep of the great prizes—which really seem well within his reach—Lord Falmouth's resolution is likely to meet with influential support in October. Unfortunately, the important aid given by French horses to the national sport, and especially to sport at Newmarket—which without their existence would too often be tame indeed—seems to be overlooked.

If all the horses whose presence at Chester had been anticipated only a week ago with no little confidence had duly presented themselves, the race for the Cup would have been worthy of its past reputation. The meeting of six handicap horses like Hampton, Woodlands, Footstep, Snail, Umpire, and John Day, would not only have been interesting in the highest degree, but in addition

various disputed points as to the relative merits of these old antagonists would have been decisively settled. Every one of the six had substantial claims to support. Hampton won the Goodwood Stakes last year, and started first favourite for the Doncaster Cup, though opposed by Craig Millar, Controversy, Bersaglier, and Oharon. Woodlands ran second to Rosebery in the Cesarewitch, and to Footstep in the Liverpool Cup, and was weighted very favourably in the Chester Cup as compared with Lord Wilton's mare. Umpire was a good fourth in the Cesarewitch, Snail ran respectably in the Goodwood Stakes and won the Ayrshire Handicap, and John Day showed good form on several occasions, notably in the Jockey Club Cup at Newmarket, for which he ran second to Braconnier and beat Hopbloom, Nougat, and Craig Millar. This season also five of the six have already distinguished themselves. Hampton, it is true, has gained his victory over hurdles, but the idea once prevalent that a horse trained to jump is of no more use for flat racing has been constantly refuted by the experience of late years. Footstep won the Lincolnshire Handicap—the first great race of the year—from a brilliant field, and Snail was a good fourth and might have been second in the City and Suburban. Umpire carried off two Queen's Plates at the Curragh—the first, according to the official report, "in a canter by any number of lengths"—and John Day won the Great Metropolitan, showing by the game way in which he finished that he was quite competent to take his part in long-distance races. The presence of these six candidates would have quite revived the fortunes of the Chester Cup; but, unfortunately, on the very eve of the race the prospects of an exceptionally strong field were blighted. First, the withdrawal of Umpire was announced, and almost immediately after the scratching of the two leading favourites, Woodlands and Hampton, followed. When Umpire, Woodlands, and Hampton had disappeared from the scene, there remained only a field of the stamp to which we have been accustomed of late years at Chester. The presence of Snail, Footstep, and John Day just helped to raise it above the level of insignificance; and, with the assistance of Pageant and Clonave—two very old hands at the business—of Collingbourne, Skotzka, and Newport, and of a couple of light weights, ten starters were mustered at the post. According to public rumour, the race looked a match between Snail and Footstep; and it was surprising that Skotzka, who made twelve unsuccessful attempts last season to attract the judge's notice, should have occupied the position of second favourite. A five-year-old, however, with only 6 st. 4 lbs. to carry, must surely have a chance, if it can gallop at all, especially on such a course as Chester, where a real racehorse is constantly bothered by the turns, and where accidents and disappointments are perpetually happening. With only ten runners, there were probably fewer disappointments than usual last Wednesday; but Footstep did not seem at all to understand the advantages of taking the inner circle, while John Day's experience on the zigzag Metropolitan course stood him in good stead, and made him quite at home at the turns. But for his 10 lbs. penalty, indeed, John Day would very nearly have secured the prize; but the weight stopped him at last, and old Pageant won easily at the finish, Snail being a moderate third, and Footstep being beaten off. Collingbourne was fourth; but he, too, is an awkward horse at the turns, and at every one he lost ground. Pageant's victory was a surprise, for he was well beaten in the Northamptonshire Stakes, and at Newcastle last year Snail defeated him easily. Mr. Grelton's horse, however, is very uncertain in his form, and every now and then, after a series of unsuccessful performances, takes it into his head to run well. But, after all, there is nothing very brilliant in a six-year-old, with only 7 st. 10 lbs. on his back, beating a moderate field; and Pageant was fortunate also in being ridden by Glover, who has been particularly successful at Chester, and who thoroughly understands the peculiarities of the course.

REVIEWS.

BAKER'S TURKEY IN EUROPE.*

COLONEL BAKER has written a volume which at the present moment will be read with keen interest. He attempts to give a picture of Turkey in Europe as it is now, and to trace the history of the changes through which it has passed. It is a very difficult task; for the different portions of Turkey in Europe are so widely apart from each other in history, climate, traditions, religion, and manners, that each has to be learnt and studied separately. For fulfilling this task Colonel Baker possesses many qualifications. He has had some acquaintance with Turkey since the time of the Crimean War, when he was with his regiment at Constantinople. In 1874 he made a tour through Bulgaria on both sides of the Balkan, and since then he has purchased and resided on a farm near Salonica. It is not often that we can get any one to describe a country to us which he has studied with the eyes of a soldier, a traveller, and a farmer; and it is an unusual proof of confidence in the Turkish Government that one of its English partisans should be willing to invest his money and spend his life in its dominions. In many ways Colonel Baker may be

said to be exactly the man to go to European Turkey. When he travels he sees with his own eyes, and does not merely find confirmation of what he has read and heard before. He is a geologist, a sportsman, and a practical agriculturist. He is completely free from religious fanaticism, and recognizes virtue when he sees it in Christians and Mahomedans alike. He has worked up with diligence and recapitulated with brevity and distinctness all that he could learn as to the ethnology, migrations, conquests, and defeats of Bulgarians, Greeks, Turks, Albanians, Servians, and Montenegrins. For the pains he has taken his readers ought to be properly grateful to him. He has put together all the facts he could collect as to the educational, judicial, financial, military, and naval systems of Turkey, and shows how many excellences they all possess theoretically, and the navy possesses practically. Of all that he speaks of from personal knowledge he is a trustworthy witness, calm, shrewd, and impartial. Of all that he speaks of from historical and other printed documents he is a trustworthy compiler, intelligent, concise, and rapid. But one reservation must be made in noticing the merits of his publication. When he speaks neither from documents nor personal knowledge, he seems to know very little, and to speak with a positiveness quite out of proportion to the amount of his data. He tells us, for example, that the Bulgarian massacres are to be looked on as something quite exceptional—a lamentable mistake generated by panic. But it is evident that he does not know nearly so much about the Bulgarian massacres as most people do in England who have studied the documents published by the English Government. Bad as the massacres were, they were not, perhaps, so indicative of the thoroughly rotten, cruel, and immoral character of the Turkish Government as the proceedings that followed them—the mock trials, the discountenancing of merciful Mahomedans, the suppression of Christian evidence, the rewarding of miscreants. Over all these things, which showed what the Turkish Government really is like, Colonel Baker passes in silence. It may be thought strange that an Englishman residing in European Turkey should not have had his attention directed to them. But where Colonel Baker has resided is eight miles from the seaport of Salonica; and an Englishman residing near Salonica no more knows of what is going on at Philippopolis than he knows of what is going on at Erzeroum. Vague rumours may have reached Colonel Baker; but he has a standing disposition to accept the Turkish official account of everything if he has no means of checking what he is told, and, having been informed that the massacres were to be looked on as a momentary mistake, he seems to have acquiesced at once in the statement. He had, in fact, other things to think of. A man who farms in Turkey has opportunities of learning some things which Englishmen at home cannot know; but, on the other hand, his attention is necessarily concentrated on matters which concern him very nearly but are not of general importance. Farmers cannot allow themselves to be absorbed in the interests of humanity; and what filled the mind of Colonel Baker with sorrow and vexation was not the sufferings of the Bulgarians, but the dismal state of the road leading from his estate to the coast, which the Turkish Government had allowed, in the most unwarrantable manner, to go totally out of repair.

The most interesting part of Colonel Baker's work is that which refers to Bulgaria. He travelled through the most important part of the country, and the peasants on his own estate are among the Bulgarians who have become, from proximity to the Greek settlements, in some measure Grecized, and talk Bulgarian for domestic purposes, but Greek for social purposes. To the Bulgarians, both individually and as a nation, he does ample justice. He highly estimates their good qualities, and although he cannot believe that a people who in 1874 showed so many signs of prosperity could be properly called oppressed, yet he owns that they had something to complain of. The Finnish origin of the Bulgarians, their absorption into the pre-existing Slave community, the intrigues practised against them by the Greeks after the Turkish conquest, their gallant assertion of ecclesiastical independence, their passion for education, their dislike of Russia, and their patient acceptance of Turkish rule until last year, are matters which are set forth by Colonel Baker with clearness and vigour, but which are too familiar to demand special notice. There can be no doubt that, however much Bulgaria has been misgoverned, it has in the last quarter of a century made astonishing strides in material well-being and in popular education. The great fault Colonel Baker has to find with the Bulgarians is their punctual observance of the endless fasts and feasts of their Church, which condemn them to spend nearly half the year in idleness. The Russian peasant labours under the same disadvantage, and in both cases the cause and remedy of this idleness are the same. So long as the population is scanty in proportion to the agricultural resources of the country, labourers will, at the bidding of their priests, pass half the year doing nothing. With the increase of cultivation comes an increase of population, and at last the pressure of population makes men work throughout the year. It is a great pity that the Bulgarian or any other Church should elevate idleness into a religious duty; but the error will be rectified by economical causes and not by theological changes. Perhaps the trait in the Bulgarians which most strikes Colonel Baker, and which is most reassuring as to their future, is their strong tendency to national cohesion. In this they are the exact opposite of the Greeks. Every Greek intrigues and works for himself. The Bulgarian never forgets the body to which he belongs. Colonel Baker mentions one educational establishment comprehending students of

* *Turkey in Europe*. By James Baker, R.A., Lieutenant-Colonel, Auxiliary Forces; formerly 8th Hussars. London: Cassell, Potter, & Galpin. 1877.

different nationalities, in which it was observed that the great aim of the Bulgarians seemed to be that each should help the other, so that the whole mass might make progress. And the popular feeling, until lately, seems to have been that the best thing to hope for was that Bulgaria should grow and thrive under Turkish protection. Even last year there never was, in the opinion of Colonel Baker, anything approaching to a Bulgarian insurrection. This appears to be the opinion also of all who are best informed on the point, and it adds the last touch of infamy to the Turkish Government that cruelties which no rebellion could justify should have been practised on people who never actually rebelled at all. The truth appears to be that the Bulgarians, up to last year, were misgoverned enough to make them feel, but not enough to make them rebel, and they owed and entertained much gratitude to the Turks for having secured to them their ecclesiastical independence. Colonel Baker is always just when he speaks of what he knows or has seen. He describes with indignation the instances he has witnessed of the arrogance of the Mahomedan towards the Christian population; the quiet despair with which the Bulgarians acquiesced in wrong and robbery when the wrongdoer was a Turk; the faulty land system which perpetually hampers the labourer for the benefit of an absentee proprietor; the oppressive system of taxation; the perpetual denial of justice, through the exclusion of Christian evidence. Nor does he merely speak of these things with impartiality, but he notices some of the strange obstacles which make the Turks pause whenever they think of trying to govern better. Not only do Turks proclaim paper reforms, but some of them actually think whether it would not be possible to carry them out. The Turkish Government cannot think the plan of farming the taxes a good one: for the Government gets much less than the peasants pay, as three, or even four, intermediaries have each to make a profit. But it has not been able to change the bad system, as, directly it tried to collect the taxes through its own officials, it found that its officials were so universally corrupt that they were bribed by the peasants not to collect what was due, and the State got even less than it got by farming the taxes.

As to the governing race, however much we read and inquire, we always come back to two main facts, which are as clearly brought out in Colonel Baker's book as in the utterances of every dispassionate observer. The first is that the ordinary humble non-official Turk is a very good sort of creature, sober, industrious, contented with one wife, but procrastinating to an irritating extreme, and having the merits and demerits of fatalistic submissiveness. The other is that Turkey did reform for a time. It started from some thing so excessively bad that to say that it reformed is not saying much; but still for a half-century previous to the accession of Abdul Aziz things got better. There was more order, a little more justice, a good deal larger revenue, and some thought for education. The reign of Abdul Aziz was a period of backsliding. The ruling caste went very much astray, debilitated by foreign loans more than by anything else. Corruption reigned supreme and unchecked. The philosopher who, hearing of a social calamity, asked speculatively, "Who is the woman?" would have found his philosophical theory justified by the history of the recent social calamities of Turkey. There was a woman, and the woman was the Sultan's mother. The domestic affection of polygamists appears to be concentrated in the relations which bind together the mother and her offspring; and in Mahomedan countries it is much more frequently the mother of the Sultan than the reigning favourite who turns her position to profit. Filial devotion laid Abdul Aziz so completely prostrate at the feet of his mother that the astute adventurer had a finger in every pie, and a percentage on every transaction. Everything began, continued, and ended in bribery, and the consequence was that reforms died out, and that a set of scheming extortioners each had his little day at the expense of the suffering provinces. The bondholders supplied the money for which the intriguers scrambled: nor was that the only way in which the country was injured by the influx of foreign money. Every one took to gambling, and to speculate in the funds became the occupation of those who might have been expected to prize their position as landholders. Colonel Baker informs us that he has known several cases of landowners who have been forced to sell their patrimonies, or to starve the estates they nominally retained, because they had lost their fortunes in the gambling of the Stock Exchange. Vexatious, therefore, as the cessation of payment of interest has been to the foreign bondholder, it has been the only possible mode of moral salvation to the Turks. They have been driven by bankruptcy into repentance, and, according to Colonel Baker's views, would be only too glad to recur to the path of reform if the chance could be given them. What is wanted is, as Colonel Baker thinks, that time should be allowed to the Turk to show his concealed capabilities of improvement. Under present circumstances, it is not worth while to spend much time or trouble in discussing the arguments for or against a remote possibility.

Colonel Baker, as we have said, possesses two special qualifications for writing a book on European Turkey. He is a soldier and he is a farmer; and all that he says on war and agriculture is marked by experience, thought, and good sense. He was expecting, when he wrote, that a war with Russia would be the upshot of the diplomatic struggles, and he set himself to think how Turkey could best defend itself. While allowing that Russia can bring 400,000 real soldiers into the field, he does not think that Turkey can get together more than 100,000 regular troops in Europe; and even when irregular forces and recruits are

added, he cannot make the total higher than 260,000. He therefore considers it impossible to defend the line of the Danube; and, although the Turks may delay the Russians in crossing the Balkans, he does not think that the passage can be prevented. His suggested plan is, therefore, that Turkey should attempt to hold nothing on the north side of the Balkans except Schumla and Varna, while the real stand should be made on the south side, in two great entrenched camps, one at Bourgas, a seaport south of the Balkan line, and the other at or near Adrianople. As a military combination this may be as good as any that could be suggested; but, when we study the details of Colonel Baker's calculations, we soon find how speculative are the figures on which he relies. He reckons that Russia, out of 400,000 men, would have to keep 100,000 in reserve; that 100,000 would be left to mask the fortresses north of the Balkans; and that of the 200,000 that passed the Balkans, 100,000 would be unavailable, either through losses or disease. When we learn that losses and disease are supposed to sweep away a force equal to the whole Turkish regular army, while that army is left intact, we can only say that this may be so, and it may not. To farmers, or rather to that very limited number of farmers who are willing to risk their fortunes in European Turkey, Colonel Baker speaks wise words of instruction, warning, and comfort. He begins by the pithy statement that an English settler and capitalist has before him the choice between two courses. He may follow the local system of farming, or he may introduce a new system of a better kind. If he takes the first course, he will never make money; if he takes the second course, he will very probably lose all the money he has. Still, farming in Turkey, and especially in the plains of Macedonia, offers an inviting prospect to a man of exceptional sense and luck. If such a man follows Colonel Baker's prudent advice, he will spend a year in the country looking about him and learning the ways of the people before he risks a shilling. If he then purchases well, he will get an estate, with farm-buildings already erected on it, at the moderate cost of 3*l.* to 4*l.* an acre. He will have land that will grow anything; adjacent mountains to give summer pasturage; cheap, if not very abundant, labour; and a population which is very stupid, very much inclined to cheat him, and only capable of very gradual improvement, but still willing, patient, and, so far as the Church will permit, laborious. His taxes will not be oppressive; his life and property will be tolerably safe; and his roads will be execrable. If such a man starts with these advantages and disadvantages, Colonel Baker calculates that he may, with a capital of 10,000*l.*, make a profit of 2,000*l.* a year, and that in twenty years he will be able to sell his estate for five times as much as he gave for it.

As a traveller Colonel Baker inserts the usual traveller's stories to give variety and relief to his statistics and his discussions. There are many of our old friends and old familiar details brought on the scene. There is the English country servant, who is always cheerful and handy, and who, although acquainted with no language but his own, can converse pleasantly with the natives by sheer force of good humour and a general wish to be pleased. There is the native servant, with a wonderful bed which always comes to pieces in the middle of the night. There are visits to consuls, pashas, and monks. There are pages about insects, and how they bite Colonel Baker; and about washing apparatuses, and how little water Colonel Baker found in them. There are two sporting scenes, in which Colonel Baker, too sure of his reputation to need to boast, recounts how he at one time killed a single deer, and at another slid down a precipice. If all these tiny incidents of travel do nothing else, they lighten the book and make us acquainted with the writer, and enable us to recognize in him a man who, if he is bitten and does not get his wash, likes to vent his natural feelings, but who is always cheerful and on the alert, seeks information from every one, can estimate the capabilities of soil, and enjoy with unaffected pleasure the beauties of scenery. Without this interspersing of personal talk the book might have been too elaborate to be popular; but, as it is, the ordinary reader, while occupied with anecdotes of fleas and cigarettes, will find himself agreeably decoyed into learning something worth knowing about Turkey. Colonel Baker also sometimes strews the arid paths of discussion with the flowers of stories which have the high merit of being both good and new. With two of these we may end our notice. Colonel Baker asked a British missionary to the Turkish Jews if he had made any converts. He replied cautiously that he could not say that he had. Colonel Baker pushed for a more precise reply, and asked how many converts his friend actually had at that moment. "I cannot say that I have any," was the answer; "but Miss W— has one at Cairo." On another occasion Colonel Baker was informed by an American merchant that he knew a place in Macedonia where gold stuck out of the rock, and that he had cut off a piece of solid gold three inches long and as thick as his thumb. "I felt inclined," Colonel Baker goes on to say, "to address the man as I once heard one American say to another who had just been drawing the long bow—'Sir, I have no doubt you are speaking the truth, and that's a fact; but if I was to meet you in New York, walking down the Fifth Avenue, arm in arm with Ananias and Sapphira, I should take you all to be of one family, that I should.'"

* SYMONDS'S RENAISSANCE IN ITALY.*

AT an unhappy moment in the history of the United States a patriot was moved to say that Columbus might have employed his time much better in some honest trade than in the discovery of America. After reading Mr. Symonds's *Revival of Learning*, the second volume of his *Renaissance in Italy*, one is tempted to think that the Humanists might have been better engaged than in the discovery of the ancient world. Mr. Symonds has been moved by gratitude to write the history of the Italian worthies "who recovered for us in the fourteenth and fifteenth centuries the everlasting consolations of the Greek and Latin classics." Gratitude, too, is the feeling which the readers of Mr. Symonds's work must cherish towards him. He has waded through amazing expanses of the dullest, the dirtiest, the most tedious literature, through weary regions of bad Latin verses, through a wilderness of letters and amatory poetry, and has compressed the result of his search into a goodly, but still a handy, volume. He has noted the essential facts of a complicated movement; he has not shrunk from repeating what most instructed people know already—the greatest of trials to an ingenious writer—and he has compressed his sketches of the most attractive characters into narrow space. Thus he has found room for a serious and comprehensive judgment of the Humanists, and we are compelled to doubt whether the shades of these worthies will feel as grateful to Mr. Symonds as his modern readers ought to do. He has extenuated nothing; he has given the good and the bad; and the picture, on the whole, is one of the saddest, one of the most humiliating, in the whole history of literature. Of course no one can seriously regret the discovery of the "everlasting consolations"; but it is not flattering to human nature that consolation had to be bought so extremely dear—at the cost, that is, of the organized corruption of society, and the deliberate and acknowledged choice of abominable lives.

Mr. Symonds's first volume, *The Age of the Despots*, explained, as far as explanation of these things is possible, the reason why culture grew up in Italy like a poisonous flower. Italian society, in short, was deeply tainted with the shames of the tyrannous life, not less deadly in the Italy of the middle ages than in the Greece of Aristotle. Pleasure, we may say, had so long been the neighbour of cruelty and of evil, that even when pleasure rose to new heights of studious enjoyment, the old contagion clung to it. Even without the revival of letters, Italian society was corrupt; but it was tragical, indeed, that all the life of the revival, in its nature so goodly and excellent a thing, should be polluted by the legacy of "selfish tyrants, vicious clergy, and incapable republics." Mr. Symonds's new volume is occupied with the setting forth of this tragedy, which, we may say with confidence, has never before been produced in so striking a manner. After a prologue, in which the darkness, as far as classical learning went, of the ages before Dante is described, Mr. Symonds brings in the figure of Petrarch. Perhaps it may be urged that more of the classical spirit was always in life—Eros masquerading in mediæval garments as the *Deo d'Amor*—than Mr. Symonds's sketch would help his readers to guess. But with Petrarch the conscious recognition of the old world, as of a world of men, not of beings misty and magical, did truly begin. In him, too, as our author does not shrink from declaring, the arrivable vanity, the unreality, the belief in the power of words, were faults as marked as they were in the movement which he commenced:—

Italian humanism never lost the powerful impress of his genius, and the value of his influence can only be appreciated when the time arrives for summing up the total achievement of the Revival. It remains to be regretted that the weaknesses of his character, his personal pretension and literary idealism, were more easily imitated than his strength. Petrarch's egotism differed widely from the insolent conceit of Filelfo and the pedantic boasts of Alciato. Nor did his enthusiasm for antiquity degenerate, like theirs, into a mere uncritical and servile worship. His humanism was both loftier and larger. He never forgot that Christianity was an advance upon Paganism, and that the accomplished man of letters must acquire the culture of the ancients without losing the virtues or sacrificing the hopes of a Christian. If only the humanists of the Renaissance could have preserved this point of view intact, they would have avoided the worst evils of the age, and have secured a nobler liberation of the modern reason.

In the history of Petrarch as a scholar the most touching moment is that in which he deplores his inability to read the manuscript of Homer which his pupil in humanism, Boccaccio, had procured for him. Mr. Symonds gives a sample of the Latin version of the *Iliad* by Leontius Pilatus, through which Petrarch had to discern, as best he might, the genius of the Greek epic. The lines are from the prayer of Lycaon to Achilles (*Iliad*, xvi. 82):—

Nūn αὖ με τῆς ἐν χερσίν ἔθηκεν
Μοῖρ' ὁλόη· μάλ' ἔστιν ἀπέχθουσαι Διὶ πατρὶ,
ὅς με σοὶ αὖτις ἔδωκε· μινυνδύων δέ με μήτηρ
Γείνατο Λαοδῶν, θυγάτηρ Ἀλταῖο γέροντος.

Here is the version which Boccaccio wrote out at the dictation of Leontius:—

Nunc iterum me in tuis manibus posuit
Fatum destructibile. Debeo igitur esse Jovi patri,
Qui me tibi iterum dedit, medio cuique, me mater
Genuit Lathoi, filia Altai senis.

Among the scholars inspired by Petrarch few did more to spread abroad the taste for good Latinity than Salutato, who, as secretary

to the Signory of Florence, took a pride in writing epistles, despatches, and even protocols, in the best Latin at his command. Ciceronian phrases became part of diplomacy—a service in which they can do little harm, and are not likely to be overworked by the task of expressing too much. A greater secretary was that Apostolic one, Poggio Bracciolini, whose account of hunts after MSS. in convent libraries Mr. Symonds translates with great humour. Quintilian, for instance, was found at St. Gallen in a terrible state for "a man magnificent, polished, elegant, urbane, and witty," now "right sad to look upon, and ragged like a condemned criminal, with rough beard and matted hair." Perhaps the most pleasant aspect of the Humanists is seen in this, their hunter stage, when they were following up every trail that could lead to a manuscript, and were setting free these brown and precious scrolls from their gaolers, the monks. It is easy to sympathize with the excitement of the chase, and with the enthusiasm of men who spent their lives and estates in redeeming the Romans and Greeks from damp garrets and cellars. Naturally the eager scholars could not be satisfied with the copyists in an age which, as Petrarch complained, examined cooks before permitting them to exercise their craft, but allowed any one who chose to call himself a copyist.

The appointment of Chrysoloras of Byzantium to the chair of Greek at Florence (1396) was a most important moment. That Greek should be taught was much; that it was taught at Florence made the town of Dante the mother-city of the Renaissance. It is to Florence that the main part of the praise of reviving letters is due, as becomes plain when Mr. Symonds analyses the services of various Italian towns:—"Florence discovers manuscripts, founds libraries, learns Greek, and leads the movement of the fifteenth century. Naples criticizes; Rome translates; Mantua and Ferrara form a system of education; Venice commits the literature of the classics to the press," though the first edition of Homer was printed in Florence. Out of all this industry, perhaps the aspect least familiar to English readers is the educational effort of Vittorino da Feltre. Italian youths were never sunk in the sloth and scholastic stupidity of Gargantua before he knew Ponocrates; but in Vittorino they found even a more admirable instructor than the ideal tutor of Rabelais. His life makes a sunshine in that exceedingly shady place, the chapter which is concerned with the abominable Beccadelli, and the scarcely less disgusting pedant Filelfo. The works of the former poet deserve, to alter Sir Thomas Browne, a place in no catalogue but that of Hell. The character of Vittorino is in amiable contrast:—

Wholly dedicated to the cares of teaching, and more anxious to survive in the good fame of his scholars than to secure the immortality of literature, Vittorino bequeathed no writings to posterity. He lived to a hale and hoary old age; and when he died, in 1446, it was found that the illustrious scholar, after enjoying for so many years the liberality of his princely patron, had not accumulated enough money to pay for his own funeral. Whatever he possessed he spent in charity during his lifetime, and true to the kindness of his friends to bury him when dead. Few lives of which there is any record in history are so perfectly praiseworthy as Vittorino's; few men have more nobly realized the idea of living to the highest objects of their age; few have succeeded in keeping themselves so wholly unspotted by the vices of the world around them.

This singular praise, especially when we remember that the infamous character of Poliziano made it impossible for the Medici to retain him as a confidential family tutor.

Not the least attractive part of Mr. Symonds's volume is formed by the series of portraits of distinguished scholars who are to the majority of readers but the shadows of names. One may regret that the large scope of the work makes it necessary that most of these portraits should be comparatively slight sketches. The idea recurs that Mr. Symonds might possibly have produced more permanent effects by "Studies" of the same dimensions as those of Mr. Pater. In this volume, for example, there is decidedly too little said about Giovanni Pico di Mirandola, possibly because his portrait has lately been drawn by another hand in a masterly style. We would willingly have heard more, too, about Aldus Manutius and the Aldine Academy, though, in that direction also, M. Didot has forestalled research. We grudge the space occupied by people like Egidius Canisio, and even by a favourite of Mr. Symonds, and a pleasing versifier, Flaminio. Of pleasing versifiers the Renaissance had abundance, and nothing short of a catalogue can give all their names and defunct performances, which truly "can exhilarate no mortal." Happily Mr. Symonds has found room for the last of the Alexandrian Platonists, a man born out of due time, who should have lived in the society of which Plotinus was the Johnson, and Porphyrius the too brief, but delightful, Boswell. Gemistos Plethon was well worth the trouble of rescuing from the dust of libraries and the hands of the industrious Fritz Schultze, to whom Mr. Symonds owes the greater part of his facts about this philosopher. Born at Byzantium in 1355, Gemistos was attracted to the Moslem Court at Adrianople by Elissaios, a learned Jew. His religious education was mixed enough to have satisfied the eclectic Hebronius of *Spiridion*; and, in the midst of Islam, the Jew taught Gemistos "what then passed for the doctrines of Zoroaster." The pupil became a judge at Sparta, and had leisure to invent an ingenious and highly absurd theosophy, of which the chief feature was the mixture of formal logic with the theology of orthodox paganism. This promising ally of the Greek Church was sent to the Council of Florence, where he found himself a person of importance, and even gave Cosmo de' Medici the first idea of the Florentine Academy. From the visit of this belated mystagogue Mr. Symonds deduces the Platonic influence that in-

* *Renaissance in Italy: the Revival of Learning.* By J. A. Symonds. London: Smith, Elder & Co. 1877.

spired the devoted Massilio Ficino, and through him Reuchlin, Melancthon, and ultimately Germany and the world.

Humanism at Rome is a less pleasant spectacle than humanism at Florence. The flower was not native to the soil; learning was an exotic; and the erudite Pope Nicholas V. surrounded himself with the most abandoned of literary swashbucklers. The conflict of Filelfo and Poggio is as dreary as that classical duel of dirty words which Horace has thought worth recording. At the Court of Alfonso of Arragon the enthusiasm for learning seems more simple and pleasing:—

Bevendelli himself professes to have cured an illness of Alfonso's in three days by reading aloud to him Curtius's Life of Alexander. . . . His passion for the antique assumed the romantic character common in that age. When the Venetians sent him one of the recently discovered bones of Livy, he received it like the relic of a saint; nor could the fears of his physician prevent him from opening and reading the MS. of Livy forwarded from Florence by Cosmo de' Medici, who was then suspected of wishing to poison him.

Probably the most brilliant and attractive page of this volume is Mr. Symonds's sketch of the character of Lorenzo de' Medici, the epitome of his age. In no other part of this work are the good and the bad, splendid and lurid as they were, of the Renaissance brought so close together. Nowhere is the tragical connexion and conflict of passions worse than those of Paganism on one side, and, on the other, of a conscious life full of knowledge and insight, more plainly to be discerned:—

It was the duty of Italy in the fifteenth century not to establish religious or constitutional liberty, but to resuscitate culture. Before the disastrous wars of invasion had begun, it might well have seemed even to patriots as though Florence needed a Mæcenas more than a Camillus. Therefore the prince who in his own person combined all accomplishments, who knew by sympathy and counsel how to stimulate the genius of men superior to himself in special arts and sciences, who spent his fortune lavishly on works of public usefulness, whose palace formed the rallying-point of wit and learning, whose council chamber was the school of statesmen, who expressed his age in every word and every act, in his vices and his virtues, his crimes and generous deeds, cannot be fairly judged by an abstract standard of republican morality. It is nevertheless true that Lorenzo entangled and enslaved Florence. At his death he left her socially more dissolute, politically weaker, intellectually more like himself, than he had found her. He had not the greatness to rise above the spirit of his century, or to make himself the Pericles instead of the Pisistratus of his republic. In other words: he was adequate, not superior, to Renaissance Italy.

It is impossible to follow all the story of declining power, of weakness shown in the frigid Christian poetry of Sannazzaro and Vida, no less than in the shamelessness of Fracastoro. There are moments when one is inclined to think that, for the author of a popular work, Mr. Symonds goes too minutely into the morbid pathology of the Renaissance. His book is not by any means suitable to be given as a school prize. No account of the period can be as complete as this is which omits that morbid and repugnant aspect. No English writer certainly has set forth so plainly the causes of the decadence of Italy, the absorption and exhaustion of the force that should have made her a nation, in pleasure, vice, and study, always voluptuous, often vicious. None has presented so fair a justification of Savonarola as the translator of Lorenzo's Carnival Hymn. It would be hard to match the completeness and appropriateness of the picture of Rome's punishment in 1527. The Spaniards came upon the rich and learned city, upon the students and delicate livers, with the ruthless cruelty of Oriental conquerors. In Mr. Symonds's abstract of Valeriano's dialogue *De Litterarum Infelicitate*, we seem to read of Assyrian, or of Turkish, rather than of European crimes. "Whatever vicious seeds had been sown in Italy by the humanists, had blossomed and borne fruit in Rome; and there the Nemesis of pride and insolence, and godlessness of evil living, fell upon them like a bolt from heaven." The sack of Rome is a dramatic *dénouement* of what was, as we have said, one long tragedy—the recovery of freedom of the human spirit, at the hands of men whose own spirits were somehow often ruined and degraded in the effort of emancipation.

Mr. Symonds's volume is perhaps even more successful in its effect as a whole than in the treatment of details. He has had often to repeat what was generally known, and he has overcome the natural disinclination to that task. His style, we venture to think, is improved by the absence of highly wrought and somewhat declamatory passages. Everywhere it is perfectly clear, and unfavourable criticism must limit itself to noting the too frequent use of well-worn figures. The torch of the lampadephoria might have been left unlit, the swan need not have chanted once more the death-song of classic poetry. Excellent as it is by itself as an addition to general culture, the volume will probably gain when read in its proper place, in connexion with the author's works on Italian art and Italian literature. We are rather inclined to this opinion because the full merit of *The Revival of Learning* hardly disclosed itself till we had finished the last page, and looked back on the whole argument of the criticism, which forms a well-proportioned work of literary art.

JOHN BUNCLE.*

"THE soul of Francis Rabelais passed into John Amory, the author of the life and adventures of John Buncle." So

* *The Life of John Buncle, Esq.* 2 vols. London. 1766.
Memoirs concerning the Lives of Several Ladies of Great Britain. London. 1769.

writes Hazlitt in the *Round Table*, and the phrase has been serviceable to Amory's memory. It forms one of those convenient labels which are regularly affixed to their wares by secondhand booksellers; and we doubt not that many persons have bought copies of *John Buncle* in the hope of finding that the spirit of the French humourist has retained his original vigour after the transmigration. They will be so far disappointed. Hazlitt, though often an acute and vigorous, is apt to be a very unsafe critic. He never allowed a pedantic regard for accuracy to hinder his use of an incisive phrase. The epigram in question is characteristic of the unscrupulous and slapdash method in which he sometimes indulged. It serves to mark certain peculiarities of John Buncle; and the reader of Hazlitt's essay may probably think that it is fairly supported by quotations. But, in fact, the alleged resemblance is of the most superficial kind. Amory, to go no further, was neither a humourist nor a satirist—a statement which may suggest the inquiry how there could be even an apparent likeness between him and his prototype. The answer is that buffoonery sometimes covers a very deep insight, and, on the other hand, is sometimes as shallow as it seems. The fools at whom our ancestors laughed might be keen satirists, wearing their motley as a protection, or simple innocents, whose absurdity would move the sympathy, instead of the smiles, of a more sensitive age. Rabelais's gigantic merriment masks a most vigorous intellect. Poor Amory's exuberance of spirits conceals nothing, and, in fact, when we have read much of it, is apt to remind us unpleasantly of the delirious ravings of a light-headed patient. *John Buncle*, however, is one of those books into which we may fairly dip for amusement at odd hours. It is pleasant to pick it up in the window of an old-fashioned country inn or in a spare half-hour in some dusty library. "It is unnatural to laugh at a natural," says Fuller. "How can the object of thy pity be the subject of thy pastime?" Perhaps the aphorism should protect poor Amory; but we may console ourselves by remembering that our laughter can do no harm; he has been dead a long time, and his ghost is beyond the reach of ridicule.

Of Amory's life little is known. He was the son of Councillor Amory, who was Secretary for the forfeited estates in Ireland under William III. The author was living in London about the middle of the last century. He published the *"Memoirs of Certain Ladies"* in 1755, and the two volumes of *John Buncle* in 1756 and 1766. The last takes the form of an autobiographical novel, and probably contains some vague reference to the facts of his own life. In the *"Memoirs"* he promised to give some account of Swift, with whom he professes to have had much communication, and here and there he makes references to some minor celebrities of the day, especially to Toland and Pope's enemy, Curll, which would be curious if we could be in the least confident of their authenticity. Fiction and fact, however, are blended—if indeed there is any substratum of fact—too oddly to justify us in placing any dependence upon these statements. Meanwhile, if the facts of Amory's life are obscure, his character is sufficiently revealed in his writings.

The opening of *John Buncle* introduces us to Amory at Oxford, studying philosophy, history, mathematics, and the German lute. One fine day he starts before sunrise on a shooting expedition, and, finding himself hungry about nine in the morning, he spies a beautiful mansion, to which he immediately proceeds, having by the way to descend a precipice at the risk of his life. In the garden he finds a venerable gentleman and his daughter. The daughter, a young lady of exquisite beauty, appears surrounded by books and mathematical instruments, and reading a Hebrew Bible. The lovely Harriet Noel—such was the lady's name—gives Buncle a delicious breakfast, with "fine cream and extraordinary bread and butter." Her father retires, and he immediately informs the lady that he believes himself to be in love with her. She replies by deprecating idle compliment, and instantly asks his opinion as to the origin of the Hebrew language. The philosophical discussion which ensued is fully reported, and in the evening the excitable Buncle makes a second declaration of love. "Charming angel," he says, "the beauties of your mind have inspired me with a passion that must increase every time I behold the harmony of your face, and, by the powers divine, I swear to love you as long as heaven shall permit me to breathe the vital air." Miss Noel delicately evades the subject by a discussion as to the history of the confusion of tongues, and Hutchinson's theories upon dialects of Hebrew. Such is her eloquence that, when she ceases, Buncle snatches the beauty to his arms, and imprints half-a-dozen kisses on her baby mouth. This, he says, gave "very great offence"; but she forgives him, and he sings a song about "Almighty love's resistless rage." It is not surprising that Buncle is soon engaged to his Harriet; but we are a little taken aback when, in the very next page, Miss Noel dies of the small-pox.

Our surprise, however, is due to our ignorance of the amazing vivacity of Mr. Buncle's character. We soon become accustomed to such events. The performance is repeated no less than seven times in the course of the two volumes. To stumble upon a fine country house, to find in it a lady of exquisite beauty and amazing intellectual accomplishments, to marry her off-hand, and bury her in the next page, is Buncle's regular practice. He finishes his career as soon as he begins it. He goes to see a certain Dr. Stainvil, who has a lovely wife. On his entering the room, Dr. Stainvil gives him a lecture on the use of the Spanish fly. As the lecture ended, the Doctor "dropt down dead at once." A rarefaction in his stomach, by the heat and fermentation of what he had taken the

except the want of good looks on the part of the women of the country, whom early marriage and a life of toil and privation render prematurely hideous. To an Orientalist who had hitherto studied the East in books alone, many of the little incidents of the journey were particularly attractive. One evening, for instance, when he had halted beside a fountain springing from the rocky cliff, the silence was suddenly broken by the voice of a singer, who turned out to be an old Brahman who was chanting as he walked verses from the Bhāgavata Purāna. "In sonorous Sanskrit poetry did he hold forth on cosmogony to me and to my bearers, who could not in the least understand him," says the traveller, who made friends with the old man, but could not obtain much information from him, inasmuch as he was half-witted; "but he spoke Sanskrit very fluently, and answered all questions by replies in Sanskrit verse, seldom answering amiss." Of the natives in general Mr. Minaef gives a good account, their disregard for truth probably not appearing a grave offence to Russian eyes. Amusing questions were often asked by them about his native land. "People in Gurhwal and Kumaon had heard of the existence of Russia and the Russian Tsar, but of the relations between our great country and Queen Victoria the simple-minded inhabitants of Srinagar have a very confused idea." They had heard also of an alliance by marriage having taken place between the two Powers; but they wanted to know whether the Tsar paid tribute to the Queen or the Queen to the Tsar. Some of Mr. Minaef's visitors at Srinagar had evidently been studying the Central Asian question, for "they asked whether it was true that the Russian Tsar had taken Kabul? Would he take Kabul soon? Of what use was Kabul to the Russian Tsar?" They asked also whether there were castles in Russia, and whether Russians would sit at table with English people, or refuse to do so like the Brahmins. Having had many opportunities of conversing with educated natives in other parts of India as well as in Kumaon and Gurhwal, Mr. Minaef is more than usually qualified to judge of their feeling towards the British Government. The following words of his, therefore, are well worthy of attention:—

The English have not pleased everyone; everywhere in India there are people who bitterly dislike the Briton. But, whatever the discontented natives may say, every dispassionate observer must constantly see with his own eyes that the English on their side are constantly thinking about the needs and the good of the people, of course without forgetting their own needs and interests, and that for a long time to come English rule and English hegemony will be indispensable for India.

The stories and legends of which Mr. Minaef has now given a Russian translation were for the most part heard by him or received in writing from natives during his stay at Almora. He met with no professional storytellers, although he inquired after them wherever he went, nor was he able to make acquaintance with any of the old women who had a local reputation for their knowledge of popular tales. But, as he says, the Indian lives in an atmosphere of fable. The child who goes to listen to the instruction of the local pundit reads and hears nothing but tales; the fakir at the temple tells tales about some god or goddess; on a holiday pious folk make a subscription and invite a Brahman to read to them from the Harivansa or the Bhāgavata Purāna. "The greater part of them do not understand Sanskrit; but there is the Brahman to explain to them what is said in the sacred writings; and so the old literary material is constantly making its way into the minds of the people." The tales which Mr. Minaef found in Kumaon are of the usual kind, dealing with themes which are tolerably familiar. But what he calls the legends are somewhat peculiar. They are intended to be sung to a kind of drum or flute accompaniment, their monotonous and protracted chant reminding the Russian traveller of the ballads or metrical romances of his native land. At their exact meaning it is somewhat difficult to arrive; for they are extremely verbose and obscure. The stories, on the other hand, are sufficiently simple, some of them being abridged versions of tales occurring in the *Panchatantra* and other collections. In No. 2, for instance, we find the ingenious jester which frightened away the lion by its braggart language; in No. 9, a Kumaon Almaschar shakes his head when his imaginary children ask for food, and so breaks the pot on which his dream of success was based; No. 27 tells somewhat feebly the well-known tale of the Forty Thieves; and No. 45 is one of the numerous varieties of the Oriental history of King Lear and his youngest daughter. Magic implements play an important part in the stories. Fortunatus meets the supernaturally endowed beings who enable him to overcome all difficulties, and the dead are brought to life by means of the resuscitating fluid which so often figures in the tales of the East of Europe. More than once we meet with the story of "the giant who had no heart in his body," the Punchkin of *Old Decem Days*, the Koachei the Deathless of Russian tales. One story—No. 10—tells how a Fakir carried off the wife of the youngest of a king's seven sons, and concealed her "beyond the seventh sea." Her husband and his six brothers went in search of her, but were turned by the Fakir into trees. The king's solitary grandson, when he grew up to man's estate, went in his turn to look for his father and his uncles, and came to the place where the magician lived. One day the youth, hiding in the sand by the seashore, saw the Fakir go down to the water-side. "All the water dried up. The Fakir went away, leaving his sandals behind him. Now all the strength of his magic lay in those sandals. The youth donned them and went to his aunt," the abducted princess. Having consulted with him, she extracted from the Fakir the

secret of his life. "On the shore of the sixth sea," he said, "there is a palace; and under the palace there is a hall of justice; and underneath it, below the ground, there is an iron cage, and in the cage is a parrot. If any one kills that parrot, then I shall die." And the youth laid his hands on the parrot, and by killing it put an end to the Fakir, who before dying breathed upon the seven trees and turned them back again into living men. In the other story—No. 46—a boy is handed over by his father in fulfilment of a vow to a Yogi who is a cannibal. The Yogi receives the boy kindly, and shows him all the rooms in his house but one. That "Forbidden Chamber" the boy enters during the Yogi's absence, and finds it full of bones. From them he learns what he must do in order to save his own life and restore theirs. After a time the Yogi returns, places butter in a cauldron, and sets it on a fire, and then tells the boy to walk round it in a circle. The boy pleads ignorance, and induces the Yogi to show him how to do so. But while the Yogi is stepping round the boy kills him with a knife, and throws his body into the cauldron. Out fly two birds, the one red the other black. The boy kills the red bird, and flings the black one into the cauldron. Having thus put an end to the Yogi, the boy finds in his house a gourd containing life-giving nectar, with which he brings back the dead bones to life.

Some of the tales are about the demons who, according to the natives, haunt every hill or tree. Thus in No. 4 a man goes into a wood and meets a Bhūt. At first it appears in the shape of a dog, and follows at his heels. Presently he hears a strange sound behind him, and becomes aware of a herd of swine chasing him. Having driven them off by throwing stones, he goes a little further and meets a lion. Having escaped from it by climbing a tree, he next meets a fair damsel. "Rejoicing thereat, he began to talk to her. He said much, but she kept silence. Presently they came to a bridge. She pushed him off the bridge, and he fell into the water. The poor fellow was all but drowned." According to Mr. Minaef, the Bhūts of Kumaon are frequently the souls of the dead, to whom worship is paid by the natives. The Rakshasa or demoniacal cannibal frequently occurs. Thus, in No. 12, a variant of the well-known "Right and Wrong" story, four Rakshasas devour a harmless demon of the Pisācha class. In No. 43 a king marries a Rakshasi, or female demon, who induces him to fling his seven other wives into a cavern, where hunger compels them to eat six out of their seven children. The seventh escapes, and eventually destroys the Rakshasi, discovering her life in a bowl at the house of her family, whither she has sent him with the intention of having him devoured there by her relations. Along with hers six other lives are found, each in its own bowl; just as in a Samoyed tale told by Gastrén, seven brothers are in the habit of taking out their hearts every night and sleeping without them, which hearts are found and destroyed by the hero of the tale, who thus puts an end to the seven brothers. In No. 44 seven brothers go abroad, and after long journeying arrive at a town which is "all in ruins." There they take up their quarters in a palace, sleeping by night in a huge bed which holds them all. Though that palace there all day wanders a goat, which at night becomes a Rakshasi, and from time to time eats one of the brothers. Their number gradually decreases till at length only two are left. These survivors throw themselves together at night. One of the two suddenly awakes and finds the other being devoured by the Rakshasi, who thereupon takes the form of a fair damsel, and says that next day she will become his wife. At earliest dawn he runs away from his proposed spouse, but she follows him. He climbs a tree, and she sits at the foot and weeps. Presently up come a rajah's servants, to whom the man hands over his would-be wife in return for two lacs of rupees. So the Rakshasi is taken to the palace, where she proceeds to kill and eat all the birds and beasts in the neighbourhood. Perhaps the most eccentric of the stories of this class is No. 11. A Brahman received one day from a Bhūt a feather which enabled its bearer to tell what people had been in a previous state of existence. Now the Brahman was cursed with a quarrelsome wife. By the help of the feather he found out that he had previously been a tiger and she a dog. So he set aside his uncongenial wife, and chose another, in whom his feather enabled him to recognize an ex-tigress. After which his house became a happy home. The reason why the Bhūt gave the feather to the Brahman was this:—The demon was in want of a human body to eat; and, being fastidious, it did not wish to eat the body of a man who in a previous state of existence had been a beast. So it commissioned the Brahman to pick him out from among the heaps of corpses lying on a battle-field the body of a man. But, before sending him off on his quest, it gave him a feather to put on his head. The Brahman arrived on the field of battle, "and saw millions and millions of corpses, but only one or two of them were shaped like men. He took one of these human bodies, and delivered it to the Bhūt. The Bhūt rejoiced greatly, and gave the Brahman many rupees." On one occasion, according to a legend related to Mr. Minaef, the English Commissioner "Sahib Tilar" (i.e. Traill) referred a dispute between two natives of Kumaon to the decision of a judicial demon who was the ruler of fifty-two other Bhūts. The demon caused blood to burst forth from the native who was in the wrong. "This occurrence was made known to the Sahib. So he inflicted punishment on the wrong-doer."

ELLIS'S COMMENTARY ON CATULLUS.*

TO the comparatively few who know how much room there has hitherto been for a thorough commentary on Catullus, and how little proportionate to his merit as a poet has been the labour bestowed upon him, we need offer no excuse for having taken some time before attempting to pronounce upon the important work of Mr. Robinson Ellis. We might say the crowning work; for, not to speak of the little volume in which, years ago, he pointed out the arithmetical system which regulated the metrical arrangements of Catullus's verification, and of his translation (in 1871) in the metres of the original—which, if it did not always please the ear, at any rate interpreted every poem, strophe, and line in a probable and convincing manner—Mr. Ellis published in 1867 his reconstitution of the text, to which is now added a parallel volume of commentary, the result of at least ten years' unwearied and well-directed labour. He has now done all that scholarship can do towards restoring Catullus to the favour as a Latin classic which he enjoyed till the beginning of the present century; since which time nothing great had been attempted until Lachmann's edition of the text, in 1823, began a new era for those who had acquiesced in the slender furniture of Doering, though the seventeenth and eighteenth centuries had been rich in commentaries of various degrees of value. Perhaps a puritanic desire to banish Catullus's poetry from education on account of its too frequently reflecting the vicious sentiments of his age and society had something to do with this; and the same feeling doubtless still exists to some extent. Yet it is undeniable that there is a vast deal of true and even pure poetry in the lyric of Verona, from whom (as Mr. Ellis shows) our Tennysons and Brownings, as well as Shakspeare and Ben Jonson, have transferred many beauties; while, as a study of language, composition, and "inimitable spontaneity" of diction, the poems are invaluable. As to Mr. Ellis's work upon them, it is difficult to characterize it concisely; one cannot explain in a few words how he has managed to elucidate in detail each verse of each poem, and to weld them into a consistent whole. Excellent use has been made of the *Quæstiones Catullianæ* of L. Schwabe, reviewed many years ago in these columns, as also of the recent admirable study of M. Couat on Catullus; and it is a great advantage to this Commentary that it has had the help, as to text and interpretation, of the eminent editor of Lucretius, Mr. Munro, some of whose notes and illustrations have appeared in the *Journal of Classical and Sacred Philology*. We are mistaken if this Commentary is not destined to rank with that writer's *opus magnum* of Lucretius, and one or two other modern editions of Latin classics, as works essential for the Latin scholar to master.

Mr. Ellis's "Prolegomena" remind us that the works of his author only escaped extinction by the discovery of a single imperfect copy at the beginning of the fourteenth century, which was the parent of all our extant MSS. Although Catullus was from the first accepted by his literary contemporaries—e.g. Cornelius Nepos and Cicero—quoted by his greatest literary successors, and long popular among his countrymen, he was for centuries wholly unknown. As Mr. Ellis notes, his book was "read and read through" at Rome in Martial's day, and long after the Satires of Horace, whose odes and epodes did not supplant his lyrics, had driven Lucilius from the field. The elder Pliny quoted him and claimed him as a countryman; the younger was his diligent student and constant reader, as also was Quintilian, whilst he is referred to by Seneca, Juvenal, and Martial. The last-named poet has left a line (xiv. 195) which couples two neighbouring towns of Cisalpine Gaul, Verona and Mantua, with "the two poets who respectively represent the highest point of Roman imagination in the Ciceronian and Augustan ages, Catullus and Virgil"; and Mr. Ellis has not failed to remark this coincidence, as well as the action on the age just preceding Catullus of Greek influences tending to an increased feeling for literary perfection. His hendecasyllables, pure iambs, seazons and glyconics, are, as we can satisfy ourselves in the case of the first by comparison, perfect by the side of his severer and less finished contemporaries, though his sapphics and hexameters are hardly so happy, and his elegiacs are almost rude; not altogether, it would seem, without some part of the fault attaching to the Greek models. Mr. Ellis's criticisms on Catullus's diction are as true and weighty as those on metre, and he distinguishes the poet's debt to the Alexandrian writers in a rare precision and perfection of form, while he was entirely free from their pedantry and sentimentalism. Some of his own peculiarities are (1) slight variations of everyday expressions; (2) quasi-adoption of prose phrases; (3) rapid change of person; (4) fondness for diminutives; (5) recurrence of the same phrase in following lines; (6) a liking for popular words, though his Latin is ever pure and unarchaic. In short, Catullus's genius is essentially Roman in its simple unaffected speech and republican spirit of freedom, and it is in him alone of Roman poets that "nature and art blend so happily that we lose sight of either in the perfection of the whole result."

Those pages of the Prolegomena which discuss the chronology of the poet's life and works strike us as having been most carefully prepared, though it may be doubted whether the preference for

the prænomén of Quintus rests upon sufficient authority to displace Jerome's assertion that it was Gaius; and Jerome seems to have been right also as to the fact of his age at death being thirty, though not in the dates of his birth and death, which were doubtless 84 and 54 B.C. On one vexed question, the identification of Lesbia with the famous or infamous Clodia of Cicero's oration, Mr. Ellis seems to have gone further to decide the matter in the affirmative than any of his predecessors, and he has brought many of the later epigrams to bear on the controversy. But we must proceed to the Commentary proper. The first poem, addressed to Cornelius Nepos, the editor is inclined to regard as a dedication only of the poet's shorter and lighter lyrics, and not of the whole mass of poems in various metres, to which the term "libellus" would be inappropriate. As the whole collection may naturally fall into three sections—the shorter lyrical, the longer, and the epigrams—it is at least plausible that the poem "Quoi dono lepidum, &c.," refers only to the first batch, whilst the fragment XIV. B, "Siqui forte mearum inepiarum," may have been part of another prologue, and the poem to Ortalus, c. LXV., a sort of dedication of the volume of elegies. It is true that this theory contradicts the consensus of opinion and the sanction of Bentley, but it is not without reason on its side. As to the identity of *passer* with our sparrow, hazarded by De Quincy in his selections (viii. 82), Mr. Ellis disposes of the question by the evidence of Bernardinus Realinus in the sixteenth century, that it was then the fashion of Italian ladies of rank to keep pet sparrows, as, according to Mr. Browning, is the case still. In dealing with the beautiful lines to his pinnace Mr. Ellis has had the advantage of Mr. Munro's analysis of the poem in the *Cambridge Journal of Education*, though not always agreeing with him. In v. 15, where it is made to say that

Ultima ex origine
Tuo stetit in cacumine,

and where Mr. Munro interprets the three first words, "From her earliest birthtime," there is some weight in Mr. Ellis's objection that this sense falls short of that which the words convey—namely, "from the furthest point to which she can trace her origin"—i.e. not descending from the moment of birth, but ascending by gradations of memory from the present to the first germ of true existence. In this sense he cites Corn. Nepos, *Att. 1*, "Pomponius Atticus ab origine ultimâ stirpis Romanæ generatus," where *ultimâ origine* mean rather earliest stock than earliest birthtime. In the same poem, at 19-21, the lines—

Læva siue dextera
Vocaret aura siue utrumque Jupiter
Smut secundus metisset in pedem—

are well translated and explained:—"As the breeze summoned her right or left, or a favouring gale fell on both her sheets at once." "The yacht bore her on safely through all weathers, as well when the wind blew only on one side, requiring the sail to be shifted accordingly, as when it fell from behind, evenly on both extremities of the sail, and was, therefore, strictly speaking, 'secundus.'" The use of "vocaret," applied to a shifting wind, is objected to by Lachmann and Munro; but Lachmann's "*vagaret*" for *vocaret* is, as Ellis sees, too archaic to be Catullian. In the fifth poem, to Lesbia (Vivamus, mea Lesbia, &c.), an illustration is afforded of one of Catullus's characteristics in v. 3, where the first two words, "omnes unius," emphasize the otherwise commonplace "assis testimare." In viii. 14, another Lesbian poem, a very prosaic and commonplace form, on the model of "nullus dixeris, nullus moueris," &c., "cum rogaberis nulla," "when you shall not be asked for at all," is displaced from the text by Mr. Ellis's approval of Statius's emendation "nocte" for the MS. "ne te," which however might, we think, be justified. In the fifth poem, above referred to, "millia fecerimus multa," v. 10, is shown from Juvenal to stand for "made up the number to"; and the use of "conturbare," in v. 11, to throw the account into confusion, likened to *ψυφῶν φησὶν*, *Att. vi. 4, 3*. In the amusing scene where Varus's mistress contrived to bring the poet pretty fairly to book about the extent of his profits and losses on the trip to Bithynia on Memmius's staff, two or three helpful notes and explanations are given. It is the tenth poem. And when the poet has been led to make-believe that he has at last brought home a litter and some slaves, and the lady, as quick as thought, to test his truthfulness, asks him for a loan of them, there seems to be so much difficulty as to "commoda," in v. 26—

Quæso, inquit, mihi, mi Catulle, paulum
Istos comoda: nam volo ad Serapim
Deferri—

and its quantity, if an imperative, that Mr. Ellis inclines to Hand's emendation—

Istos: commodum nam, &c.

In this case the verb governing "istos" is understood, and "commodum nam" will mean "for just in time," "as luck will have it," I want to go to the temple of Serapis. In what immediately follows, "Mene me, inquit puellæ," is the MS. reading, which Lachmann retains. Mr. Ellis interprets this ironically, "You may as well wait till I come," "There's plenty of time for that!" Not so fast!

On Poem XII, and the reproaches therein contained to Asinius Pollio, elder brother of Horace's and Virgil's friend, for stealing a napkin of a set given him by his friends Veranius and Fabullus we get in the preliminary matter indications of the not infrequent commission of this offence (Poem XXV. is on the same subject).

* *A Commentary on Catullus*. By Robinson Ellis, M.A., Fellow of Trinity, Oxford, late Professor of Latin in University College, London. Oxford: Clarendon Press. 1876.

which was rendered the easier because, as the Romans reclined at meals on the left hand, the movements of that hand were easiest to conceal. The custom was for guests to bring their own napkins, which led to a fashion in them, and to their being objects of petty, but perhaps conventionally tolerated, theft, like our umbrellas. In this case the first words of the poem—Marrucine Asini, &c.—have a special point which may escape some readers. *Marrucine* refers to the fact of Asinius's native place being Teate, the chief town of the Marrucini, a tribe on the river Aternus eulogized by Cicero for their probity and high character (see Cluent. lxi. 197). In the curious poem (XVII.) in Priapean metre, alluding obviously to some scandal of provincial notoriety, addressed to Colonia and its rotten bridge, there is good evidence as to the locality. Schwabe and Muretus incline to identify it with the modern Cologne, a small town a few miles east of Verona. This view was held before Muretus by Alexander Guarinus, who describes the town as it existed in his own time (the sixteenth century), with the marshes between it and Verona, crossed by a very long wooden bridge. Another poem (XXII.), upon the poetaster Sulfenus, and his utter dullness when he quits everyday conversation for his chosen hobby, ends in v. 21 with a reference to Æsop and Babrius—"Sed non videmus mantica quod in tergo est"; "None sees within the wallet hung behind our own"—that part of the wallet behind us which contains our own vices, as the part in front does our neighbours'. The mantica was a double bag or wallet slung "fore and aft" over the shoulder, as we have seen some walking postmen carry their bags. In Persius, iv. 24 ("Sed precedenti spectatur mantica tergo," by a slight variation, each carries a wallet on his back, perceptible to his neighbour, not to himself. The always charming poem on Sirmio is done full justice to by Mr. Ellis; its niceties ("ocelle," "solutis curis," "acquiescimus") are noted and paralleled, and its last lines defined and made plain. They run:—

Gaudete vosque, O Lydiæ lacus under,
Ridete, quicquid est domi cæ humorum.

As in III. 1. 2, "Lugete—quantum est hominum"—so here the construction of the last verse is equivalent to "Laugh out all hearty laughter of my home." From the fact that "cachinni" is sometimes used—e.g. in I.XIV. 273, of the plashing of waves—Statics was probably led to interpret "Laugh out, ye waves with all of ringing laughter that is at home"; and, going upon some such a theory of the sense, Landor was led to a similar idea of Catullus inviting the waves to laugh; but, as Mr. Munro here agrees with Mr. Ellis, *domi* defines the word in its literal sense, and the adjuration is, as it were, "ridete omnes vos cachinni qui domi estis."

Poem XLIV. affords notable examples of the purely prose lines which occur in Catullus's descriptions—e.g. 5, "Fui libenter in tuâ suburbanâ," and, 11, "Orationem in Antium petitorum"; and Mr. Ellis identifies the Sestius of this poem with Cicero's intimate acquaintance and Pompey's friend. In c. 50, v. 18, "Nunc auidæ cave eis, precesque nostras," &c., he sees some ground for Servius's assertion that there was an old verb, "cavo," "cavis," of the third conjugation—and hence the comic imperative (cave) pronounced rapidly as a monosyllable. One or two more happy conjectures may be quoted. In c. 55, descriptive of the poet's search, here, there, and everywhere in Rome, for his friend Camerius, a man about town, it has always seemed labour lost to hunt for him in the bookshops, even if "libelli" (Te in Circo, te in omnibus libellis) meant *bookstalls*, so early, judging by the company he seems to have kept. Our editor surmises that it may mean *placards*, either giving notice of his effects for sale, or (sportively) of himself as a missing article (I have sought for you in every place where I have had a chance of hearing of missing articles). In the Glyconic Epithalamium (XLI.) Mr. Ellis illustrates each phase of the procession and ceremonial by the Roman antiquities, and pointing out the poet's delight in descriptions and similes borrowed from plants. The Amaracus of v. 7 he takes to be an exotic Oriental "marjoram," if one at all, and the white parthenice of 187 the "convolvulus," which Pliny calls "parthenium."

We have said enough to give a notion of the helpfulness of this Commentary. One or two instances may, however, be added of the editor's skill in calling to aid internal evidences of dates for particular poems, and also one or two apt citations of modern parallels for expressions and sentiments. Thus in c. 45 the date of the "Acme and Septimius" poem is established as B.C. 55 (the year of Caesar's first campaign in Britain and of Crassus setting out for Syria), both by "Marvult quam Syrias Britannique" in v. 22, and by "Cresio veniam obvis leoni" in v. 7. The green-eyed lion became familiar to Rome this year at Pompey's Games at the dedication of his Temple to Venus Victrix, when six hundred were exhibited. In like manner the poem as to the search for Camerius, above referred to, seems to date itself at 55 B.C. (to which year most accounts ascribe the dedication of Pompey's Theatre and adjoining Piazza—though there is a story of a date three years later, 52 B.C.), by the mention of "Magni Ambulatio," the piazza in question. To turn to modern quotations, we shall find Ben Jonson, in *Cynthia's Revels*, v. 2, clearly imitating Catullus, XIII. 13 ("Deos rogabis Totum ut te faciant, fabulle, nasum"), in his words, "Taste, smell, I assure you, sir, pure benjamin, the only spirited scent that ever waked a Neapolitan nostril. You would wish yourself all nose for the love o't." Where, in Poem XVII., the young wife of the old man at Colonia is said to be "Adservanda nigerrimâ diligentius uvis," there seems no doubt that Ben

Jonson copies him in "The Fox," 1, *fin.*:—"All her looks are sweet Like the first grapes and cherries, and are watched As near as they are." Another parallel in Ben Jonson might be cited, Poem LV. 12 (see p. 152), and, in the "Acme and Septimius" poem, Mr. Ellis shows how our laureate has laid his Catullus to heart, by quoting Edwin Morris saying, "Shall not love to me, As in the Latin song I learnt at school, Sneeze out a full God bless you right and left?" Another parallel from the same poet's *In Memoriam* comes in appositely for vv. 34-5 of the Second Epithalamium on the double name of "Hesper-Phosphor." There are also not a few (possibly unintentional) parallels in Shakespeare, as where, *a propos* of the poem to Cæcilius, and the line "Quare, si sapias, viam vorabit," Mr. Ellis cites, at Mr. Clayton's suggestion, *Henry IV.* Part II., i. 1, "He seemed in running to devour the way."

It is with hesitation that we dissent from Mr. Ellis's theory of Catullus's dexterity in his form of eulogy on Cicero (c. xlix.) It seems far-fetched to suppose even a slight inuendo or reservation in the words, "dissertissime Romuli nepotum," which he says, in his note on v. 1, is slightly ironical. We see no reason in such an antithesis as follows in 6-7, "pessimus—optimus," to detect either an unreal humility or to suggest a suspicion of persiflage. But these are small matters. Of the book, as a whole, we will only add that it maintains at its most advanced point the character of our English scholarship.

AMSTERDAM AND VENICE.*

(Second Notice.)

BOTH the author and the illustrators of this volume have the merit of a certain veracity, which does not, however, prevent them from recognizing the poetry of the subjects they have to deal with. M. Havard in his descriptions of Venice leaves the reader few or no illusions, and yet he is himself still very strongly impressed by certain aspects of Venice and by certain buildings or situations there. M. Gauchere, the etcher, has long been familiar with Venetian buildings as material for his art, but his way of looking at them is not at all that of the most popular painters of Venice with whom the public has been long familiar in the exhibitions. We all know how that city is usually treated; how much poetry, or pseudo-poetry, is lent to it by artists, and how seldom they give us anything like the plain truth about the place. Another common custom of theirs is to adhere with tiresome fidelity to the best known views, so that, although we have seen hundreds of pictures of the Ducal Palace, there are many parts of the city of which we hardly ever get a glimpse. M. Gauchere takes a pleasure in hunting up interesting little bits which have never been drawn before, and in this way he enables us to look about us almost as if we were in a gondola. He is a complete realist, and does not embellish his subject; but he generously contrives to select good material which composes well, and he shows it under a favourable effect of light. The book is plentifully illustrated with woodcuts, some of which are drawn by the author. We cannot say much for the artistic quality of the woodcuts, many of them being certainly not good enough for a volume of this kind; but at any rate they assist the text by giving us information of a graphic kind on many points of detail.

M. Havard begins his description of Venice by a few touches of colour. Venice, he says, stands out in white and rose-colour against a dark blue sky and upon an emerald sea, whilst Amsterdam is reddish-brown on a silvery sea and against a pale blue sky. This of course means that the prevailing or characteristic effects are of that kind; but there are times of exception. The sky of Venice is not always azure, though the sky of Amsterdam can never in that latitude take the deep ultramarine blue which it has at certain times of the year in the South. Another contrast between Venice and Amsterdam is that one is a city of silence, a place for idlers and dreamers, the other a city of activity and noise, a place for workers.

Descriptions are very difficult to manage without making them tiresome, and M. Havard has not escaped this danger in his description of Venice from the Campanile. It is exactly like a guide-book, neither better nor worse; and then follows a long catalogue of palaces, exactly in the same manner, yet containing some interesting facts. As usual, however, we have to thank M. Havard for telling us the simple truth. The word *palazzo* can delude nobody who has been in Italy; but an Englishman who translates it into "palace," or even a Frenchman who translates it into "palais," is likely to incur some disappointment:—

A ce mot de "palais" que de merveilles enfantées par notre cerveau! que de rêves évoqués par notre imagination! Mais en Italie, il faut singulièrement en rabattre. Toute maison est un palais comme tout voyageur est une Excellence. On ne regagne pas sa demeure, on rentre dans son palais. Un employé à quinze cents francs est logé dans un palais. Mais de même qu'il y a fagots et fagots, il y a aussi des palais de tout calibre et de tout aspect. J'en sais quelques-uns dans des ruelles infâmes; sur des canaux puants, dont les murailles lézardées sont couvertes d'un sort de lèpre, dont les balcons ruinés menacent les passants. Leur aspect sordide et repoussant les fait éviter avec soin; pour rien au monde on n'y voudrait entrer, à plus forte raison y loger et y vivre. Ce n'en sont pas moins des palais, et les hôtes peu susceptibles de ces taudis vermineux se croiraient fort amodris si on leur parlait de leur maison. Les palais du Grand Canal ne sont point, heureusement, dans ce cas. Leur position sur le Corso vénitien les préserve de l'abandon auquel tant d'autres sont livrés sans réserve. C'est

à peine et sur cette grande et large voie, nous en trouverons cinq ou six menaçant ruine en dans un état affligeant de dégradation; et pour la plupart de ces vieilles et nobles demeures, le titre qu'elles portent ne nous semblera point usurpé.

Most of these palaces on the Grand Canal have changed their owners since the fall of the old Venetian aristocracy, and especially during the Austrian occupation. A few still belong to the descendants of the old families, others have been purchased by foreigners, and others are rented by families who pass regularly a few months of the year in Venice. All these have been more or less preserved, but others are not so fortunate:—

Malheureusement bon nombre, ravagés à l'intérieur, dépourvus de leurs tableaux et de leurs statues, vœux de leurs marbres sculptés, badigeonnés, peints et repeints et tendus de papier à deux francs le rouleau, sont devenus par tranches et louches en appartements garnis. Il en est même qui sont devenus de simples auberges. Toutefois ils n'ont point, malgré cela, abdiqué leur désignation primitive. L'*Albergo Reale* porte toujours le nom de Palais Bernardo, l'*Hôtel de l'Europe* celui de Palais Giustiniani; l'*Albergo Barbieri* s'appelle encore Palais Zuchelli, et ces nobles noms, pompeusement étalés sur la note, servent à en déguiser les exagérations, à distraire l'attention, et à rendre le total moins pénible à solder.

Besides these inns and hotels, there are palaces on the Grand Canal which are occupied by picture-dealers who pretend to be collectors—a class which exists now in almost every great city in Europe, and which is not always easily distinguished from genuine collectors, of whom there are also good and respectable examples at Venice. The saddest story of family decay in connexion with the palaces of the Grand Canal is probably that of the Foscari. This ancient and once very wealthy house, which had received royal guests, including Henry III. of France, was ruined in the last century by the extravagance of its chief, and there still remained thirty or forty years ago the last descendants of the Foscari in the upper chambers of the Foscari palace. All the works of art had disappeared from the walls; even the furniture had gone, down to the very house linen; yet still an old man of eighty and two infirm old maids clung to the house of their ancestors, and lived in it with no comforts but a few broken chairs and some old boxes. Since these last Foscari died the palace has been used for various purposes. It has been an Austrian barrack, and is now a commercial school.

M. Havard thinks that the dingy appearance of certain palaces at Venice may be compared with the smoke-begrimed exteriors of London; but as there is hardly any smoke at Venice, and no dust, the darker-looking houses have become gloomy from the natural embrowning of the materials:—

Malgré leur aspect sombre [adds M. Havard] ces demeures aristocratiques se colorent sous les feux du soleil, et leurs façades brunes semblent trancher en clair sur l'azur foncé du ciel.

Et puis ce sont les dîts très tendre qui s'argentent de joyeux reflets, les grands poteaux qui sortent de l'eau tout enroulés de couleurs vives et coiffés de la corne dogale, les gondoles noires qui filent comme des hirondelles, laissant à leur suite un sillon de mousse blanche. C'est le ciel, le soleil, la lumière dorée, les marbres blancs et roses, les ombres transparentes, que sais-je? C'est le charme, c'est la vie, la paresseuse rêverie qui s'empare de tout votre être, qui prend possession de votre cerveau, qui pénètre votre cœur, pendant que l'air moite caresse votre visage et vous baigne dans ses éternelles vapeurs.

Every Friday there are great tents on the fish-market and much traffic in fish from the Adriatic, which the Venetians, luckily for their happiness on that day of the week, are very fond of, and indeed appreciate so much that it seems to them impossible to get fish of equally good quality elsewhere. M. Paul de Musset tells a capital story about a grave personage, the Count André, who was bewailing his "douloureux chagrins d'amour." The lady of his adoration had been called back to Milan by her family, and this so afflicted her admirer that he was ready to die with grief. It then occurred to M. de Musset to inquire wherefore, under such circumstances, the Count did not go to Milan himself to be near the lady whose presence was so vitally necessary to him. The answer was thoroughly Venetian:—"I have always lived at Venice, and could not live at Milan, where people speak a dialect that tortures my ears—and besides, you cannot get fresh fish at Milan." Not that he loved the lady less, but the Venetian fish-market more.

Some of the most interesting pages in M. Havard's book deal with the Arsenal at Venice. He tells us about the famous galley of the Doges, the *Bucintaur*. There were three of these galleys in succession; the first lasted from 1520 to 1600; the second from 1600 to 1725; the third from 1725 to 1797, when it was burnt. Some notion of the magnificence lavished on this boat may be gathered from the cost of the gilding, which alone amounted to more than 8,800*l*. There was a great cabin, or saloon, with sofas all round, and a throne at one end for the Doge; and the deck was supported by gilded statues, whilst above the deck was an awning of flame-coloured velvet embroidered with gold. Nothing now remains of these astonishing barges except the models in the Arsenal; and it is not likely that they will ever be reproduced on the original scale, for the state-barge is almost a thing of the past; and, when modern rulers go to sea, it is generally in a plain, but very comfortable, steamer.

Italian princes often occupied themselves much less innocently than in displaying their magnificence on land or water. They still preserve at the Arsenal some of the instruments of torture which were commonly used by the Council of Ten—for example, two iron helmets studded internally with sharp spikes, which pricked the patient's head. Meanwhile the judge, seated by his side, put his ear to a little opening in the visor to hear any avowals that might

be elicited. There is a pretty collection of instruments of torture which at one time belonged to Francesco di Carrara, of Padua. Amongst them is a key, so contrived that a spring would suddenly protrude a number of little points so sharp that the patient would not feel the puncture, yet he would die of it, because they were poisoned.

There is a fine public garden at Venice, with avenues of beech and plane; and you may lean upon the marble balustrade which surrounds the garden and admire one of the best views of the city. It would be an excellent promenade if there were any promenaders; but, by one of those curious perversities which often characterize fashion in great cities, nobody goes to the public garden, although few trees and little verdure of any kind are to be seen in the other quarters. Venice is not by any means the only town which has a good promenade and will not use it. Almost every French town has its promenade, but the public use or neglect it just as it happens, often preferring a noisy street or square unless there is some special attraction to the public walk. Such an attraction was found by an ingenious Venetian, who imported a strange animal, harnessed it to a vehicle, and drove it slowly about the public garden. The strange animal was simply a horse, but all Venice went to see it, just as people in an English country town would go to see a zebra:—

Il n'en fallut pas plus pour donner aux jardins publics une animation tout à fait insolite. Bien des gens, qui n'avaient aucune idée d'une voiture, accouraient pour contempler ce véhicule extraordinaire et le quadrupède chargé de le tramer. On pouvait tenir quatre dans ce carrosse, et pour une somme fort modeste, faire le tour des jardins. On s'entassait douze sur les banquettes, et l'on se penchait à corps perdu pour observer le mécanisme prodigieux qui faisait tourner les roues. Jamais la pauvre rosse qui menait ce monde primitif n'avait excité pareille admiration. Sans cette importation, qui fit la fortune de l'homme ingénieux qui en eut l'idée, des milliers de Venitiens n'auraient point connu d'autres chevaux que ceux du monument Coléoni et de la place Saint-Marc.

M. Havard, though strongly feeling the poetry of Venice, fully recognizes the evil characteristics of the place, the dirty narrow canals, the crumbling, scarcely habitable old houses, the little dark shops where only four persons can find room for themselves, and where the buyers cannot see distinctly what they purchase. The contrast with Amsterdam is great in this respect, Amsterdam being a city of light, and air, and space, with great openings everywhere. There is the same contrast with respect to verdure, which refreshes the eye frequently at Amsterdam and everywhere in the outskirts of the city, whilst it is grievously rare at Venice. Of the two cities, Venice may be the more curious to visit, and is certainly much the richer in architecture; but it is highly probable that most Englishmen would prefer Amsterdam as a place of permanent residence, after the first sensation of novelty had worn itself away. The Venetians themselves are intensely attached to their city; all very peculiar places inspire strong feelings of attachment in those who have been born there; and the history of Venice is still remembered with pride by its inhabitants of the present day. Few people are so little disposed, in the upper classes, to open their houses to strangers. We English, though thousands of us visit Venice, know next to nothing of its inhabitants. M. Havard tells us that they are reserved even amongst themselves, and will often sit quietly observing and inwardly criticizing for a long time without saying much. Again, the Venetian noble will have a set of friends at his *café* whom he never invites to his house, and who have never spoken to his wife. The seclusion of Venetian ladies appears astonishing to an Englishman; but we may remember that Venice is very near the East, and had in former times such constant dealings with the East that manners may have been affected by Oriental ideas as architecture certainly was. Venetian women rarely go out, and yet they busy themselves little about household affairs which afford so much occupation to Dutchwomen. M. Havard considers that female beauty is not so much the rule at Venice as at Amsterdam; but, like a true Frenchman, he seems to be fully susceptible of impressions from beauties of very different types:—

Leur type de beauté est ou brun ou blond; mais les blondes elles-mêmes (et elles sont fort nombreuses) n'ont pas cet incarnat velouté qui ressemble au dard d'une fleur et parait devoir s'envoler au moindre souflet et se ternir au premier rayon de soleil. Sous leurs cheveux dorés, leur peau prend des teintes mates ou d'un blanc laiteux qui relèvent deux yeux bruns dont l'expression est étrange et le charme tout particulier. Il est peu de physiognomies qui captivent autant que celle de ces blondes Venitiennes.

It appears that these fair ones are held to be perfidious, and there is a proverb which says "Beware of fair girls and green stones." The green stones are slippery at Venice as they are in an English brook when the aquatic mosses have clothed them with that colour. Dark girls, on the other hand, are supposed, at Venice, to be simple-hearted, and it appears that there are no snares in their great black eyes, their wavy hair, and their pretty brown skins. We are sorry to hear that all the charms of *bruno* and *blonde* alike fade too fast, and that there are few beauties of thirty to gladden the eyes of a wandering Frenchman like M. Havard.

SHODDY.*

A PECULIAR difficulty has in the last few years come before those whose sad fate it is to review the novels of the

* *Shoddy: a Yorkshire Tale of Home.* By Arthur Wood. 3 vols. London: Tinsley Brothers. 1877.

day. Ever since the first of the female novelists now living chose to assume a masculine name, not a few women have tried in the title-pages of their books to pass themselves off as men. In many cases this was only carrying out to its proper end the affectation which characterized every page of their writings. They had affected an acquaintance with the follies and vices of men, such as could only be gained by intimacy with men who were foolish and vicious, or by a careful study of foolish and vicious books. They showed perhaps some remnant of shame in going a step further and in trying to hide the fact that they were women. Others, no doubt, whose works were innocent enough, only aimed at amusing themselves and their friends, and at playing a harmless trick on their readers by the deception they practised; while at least one well-known writer, whose popularity greatly exceeds her merits, chose in one of her later stories to drop her own name and to pass herself off as a man, perhaps in the hopes of receiving, as a young and unknown writer, a more merciful treatment than, as a hardened offender, she could have justly expected had she allowed her name to appear. The reviewer, then, naturally enough becomes suspicious, and does not place full trust in title-pages. In the words of the countryman whose eldest daughter was accidentally christened John, he finds himself crying out, "Him's a her, after all." It is only a few weeks ago that we had to express a difficulty we felt as to the sex of a new writer, and now we once more experience the same misgiving. We have not the least reason to believe in any relationship between Mr. Arthur Wood and a well-known female novelist of the same surname, but there certainly is a considerable resemblance between the style of the two writers. The superiority we must certainly assign to the gentleman; for he writes as Mrs. Henry Wood might write if she had once succeeded in getting rid of a good many of her faults, leaving, however, a great many more behind. Nevertheless, for the first novel of a young writer, the story is not a bad one. The plot is improbable to the last degree; but as the mysteries, though they are rather soon seen through, are not explained till towards the close of the third volume, the improbability does not much matter. An author, we hold, always makes a mistake in attempting to find an explanation of the eccentric and mysterious conduct of his hero, which, absurd though it was in itself, was altogether necessary for the interest of the plot. Should we ever—*admit omen*—write a novel, when once we had worked up the plot to the proper state of interest, and, with our mystery still unexplained, were close on the end of the third volume, we should turn on our readers, and with a polite bow beg to part company. "We have," we should say, "succeeded in interesting you through three three hundred pages, and are you now to force us to give a pitiful explanation of our mysteries and of the motives of our heroes and heroines? We know no compulsion so to do, and if reasons were as plentiful as blackberries we would not give you one on compulsion. Be satisfied that you have been amused as a child is by the ticking of a watch, and do not spoil your amusement by asking to have the works pulled to pieces."

Mr. Arthur Wood has four or five very pretty mysteries, if not more. The hero's whole conduct is most mysterious; but, as it was necessary for the interest of the story, no sensible reader would trouble his head in the least about an explanation. Mr. Wood might perhaps object, and with some reason, that no sensible reader would trouble his head about his story, and that silly readers look upon the explanation and the winding up as the greatest treat of all, and, like children at a feast, ask that the nicest morsel should be kept for last. But even they, we should imagine, would be quite satisfied when the disguises were thrown off and each character appeared in his proper form. They would be satisfied with knowing that Joe Boothroyd, the pretended foreman, was in reality Edward Sherwin, the rich man, and they would not trouble Mr. Sherwin for an explanation why he had chosen to pass himself off with his dead father's old partner as a man in need of work. The explanation which is given is so feeble and so absurd that it spoils to a great extent the pleasure that had been given by the various exciting situations into which Sherwin's disguises had led him and the other characters. The story, indeed, soon plunges the reader into an abundance of mysteries. In the first chapter we have, in the midst of the well-known "rich mellow sunlight of a warm evening in July," a stranger "with a heavy moustache and thoughtful eyes," who smokes at least three cigars in nine pages, and wins at the same time the heart of the heroine, Dolly Worsdale. He apparently disappears altogether from the story, though of course the reader knows that it is not for nothing a man has "a certain look of quiet determination in his grey eyes that invested him with an individuality apart from the crowd." Nor, again, was it for nothing that, while in the opening chapter two other characters smoked pipes, this gentleman smoked three cigars. In many novels of the present day the hero is as commonly introduced by the puff of a cigar as in the old plays by a flourish of trumpets. We next learn who Dolly Worsdale was. Her father had, as a poor lad, come to old Mr. Sherwin's mill in search of work. He had been taken in, and in the end had been made a partner. Mr. Sherwin had an only son, Edward, the hero of the story, and one who, in his time, played many parts. The son would not take to business, but generally lived on the Continent, too often frequenting the gaming-tables. One night, when returning from them a large winner, he was nearly murdered and robbed. Besides his money, there were taken from him a portrait of his father, and the last

letter written by the old gentleman, full of good advice to his dissipated son. Just at the time when this attack was made on the son the father died, making a curious enough will for a man of business. While he left "the rest of his handsome fortune to his son," he bequeathed his share in the business to his old partner Matthew Worsdale, expressing at the same time "his hope that his boy would yet return to the usefulness of trade." A father is not very reasonable who hopes that his son will follow him in trade at the very time that he deprives him of all share of the business. The son lived abroad, and was never seen at his old home. His address even was not known, and he could only be communicated with through his London solicitor. Here, then, we have in the second chapter a second mysterious character, not counting the unknown robber who had possessed himself of the portrait and the letter, as will be seen, to some purpose. In the third chapter Mr. Worsdale receives a letter from Edward Sherwin, introducing to him "a young fellow who will probably call on you in quest of employment"; and in the fourth chapter the young fellow, Joe Boothroyd by name, accordingly turns up. Even the most careless reader can at once see that there is a mystery about him, and that he is not the poor workman that he pretends to be.

Meanwhile, Priscilla Worsdale, Dolly's younger sister, goes on a visit to the seaside, and there receives the attentions of a stranger who is more mysterious than ever. He is a Captain Clarence, a gentleman with white hair, but dark brown eyebrows, moustache, and beard. Priscilla's governess, Miss Skimple, has also her mysterious gentleman—a military man who years before, under the promise of an early marriage, had robbed her of all her savings. Item, there was a mysterious man in a large cloak and profusion of dark hair. Item, there was a Colonel Wentworth, who also was mysterious. Item, there was a Major Maismore, who had his mysteries also. Item, there were a mysterious lady and gentleman staying at the country house of Mr. Sherwin's solicitor. As one mysterious character follows another, we feel inclined to call out with Macbeth:—

What! will the line stretch out to the crack of doom?

Another yet?—A seventh?—I'll see no more.

Before long, Captain Clarence, the gentleman with the white hair and the brown moustache, adds to the confusion by turning up at Mr. Worsdale's house and passing himself off as Edward Sherwin. The reader is not kept in the dark on this point. Though he is not told in so many words, he is allowed by his sagacity to see that Captain Clarence is an impostor. In the end the mysteries get swallowed up one in the other like the slides of a telescope, and it is discovered that the real Edward Sherwin and the man who attempted to murder him have to share all the characters between them. It was Edward Sherwin who made love and smoked the cigars "in a dark and almost shaggy beard and moustache" in the first chapter. It was Edward Sherwin who, "with an open bold face neatly shaved and trimmed," passed himself off as Joe Boothroyd. It was the man with the white hair and the dark moustache, whatever his real name was, who robbed the governess, nearly murdered Edward Sherwin, drugged and robbed Frank Ossett, cheated Tim Worsdale, made love to Priscilla, disguised himself with a profusion of dark hair and the large cloak, and passed himself off as Captain Clarence, Major Maismore, and Colonel Wentworth. He at last got murdered himself, through a mistake, by the second villain of the piece, who, being only a bill-sticker, is not of sufficient social importance to be allowed to be mysterious. When dying at the hospital he is recognized by the poor governess, who, by a coincidence as strange as any in the book, happens to be a chance visitor there at the very time he is brought in. He is allowed to die penitent, though his penitence does not much matter, as without it and the usual death-bed confession the hero and the heroine had been able to get married.

In spite of its gross extravagance, there is yet a certain amount of interest in the story, while two or three of the characters are drawn with considerable cleverness, though scarcely with much originality. It is a pity, however, that the thread of the plot should so often be broken with long pieces of fine writing. Who cares for such threadbare remarks as the following?—

Did it ever occur to you, in a crowded thoroughfare, what varied volumes of biography, adventure, and romance,—what histories of schemes and aspirations; of hope, joy, and disappointment; of wild theories, or miserable longings, are before, behind, and on every side of you, more strange and startling, could we but know the inner life of each, than can be found in any circulating library in the world?

To know that every person we see has a history and an individuality of his own, and like to no one's else; from which, were it fairly written down and dispassionately read, we might learn the strangest stories from the most prosaic exteriors; stories of heroism perhaps, such heroism as belongs to fortitude and patience, under great trouble and privation; tales of ambitious aspirations wretchedly bound in the most threadbare of cloth, &c.

Still more dull are the attempts at humorous writing which seem to be inserted almost at regular intervals throughout the story. We could almost imagine that when the author had finished the book, some injudicious friend to whose perusal it had been submitted had pointed out that it wanted humour, and that humour could be with the greatest ease inserted. At all events, the scenes that are meant to be humorous have so little to do with the plot that happily they can be passed over. We would advise Mr. Wood, when next he writes, to keep to his mysteries:

and to leave humour alone. We all of us have our different gifts. As the Vicar of Wakefield said to his wife, "I do not, my dear, dispute your ability at making goose-pie, and I trust that you will leave argument to me."

MINOR NOTICES.

IT is a good sign in these days that so much loyal care and labour should be given to providing more exact and trustworthy presentations of the works of eminent authors. We had recently to notice a very satisfactory performance of this duty in the case of Coleridge; and we are glad to see that similar attention is being paid to Shelley and Burns. We have already spoken of Mr. Buxton Forman's new edition of Shelley's poetical writings*, the third volume of which is now out. It contains "Adonais," "Hellas," and the "Lines written on hearing the news of the Death of Napoleon," completing the series of the mature works published by the poet during his lifetime; and also a number of pieces not published till after his death. In dealing with the latter, the editor has adopted in each case the most complete version and the best readings he could find, at the same time noting minute variations of interest between different editions, and also any variations shown by collation with the manuscript whenever it was available; and all changes made by the editor himself, however trifling or obviously needful, are specified. Guided by these rules, Mr. Forman has produced the most complete and authentic edition of Shelley which has till now been published. Among other things, he remarks that his study of the poems has convinced him that the epithet "careless" ought not to be applied to the peculiarities and laxities of Shelley's punctuation and other points in composition; for he appears to have taken elaborate pains to redact and punctuate, though occasionally he was led away in the ardour of realizing some idea which struck him at the moment. There are, perhaps, some readers who may be amused by the editor's enthusiasm on these matters, and the earnestness with which he notes the difference between the shape of Shelley's and of Mrs. Shelley's commas, and also Shelley's invariable spelling of the final *ize* with a *z*, which Mrs. Shelley altered to *s*; but it is at least a proof of his genuine interest in his work.

The first volume of a new and handsome edition of the works of Burns†, edited by Mr. W. Scott Douglas, gives promise that a complete and carefully revised collection of the poet's writings, such as has long been wanted, will now be provided. The aim of this edition is to bring together the whole of Burns's poems and correspondence, giving the "text with critical exactness, unabridged, and untampered with, and recording the numerous and interesting variations in his manuscripts and several authorized editions." The poems and lyrics are arranged in strictly chronological order; the date of each composition and the author's age at the time of writing it are given on every page, so that the reader can see at once to what period they belong; and the original form of publication is also stated. Moreover, a considerable number of the author's undoubted productions are now to appear for the first time in a collective form, several of them, it is said, having hitherto been kept private. The prose writings will be similarly arranged, and carefully annotated; and the editor hopes to give a comprehensive view of Burns's life, including "submerged and mystified facts in his brief and eccentric career." The typography of the book is large and clear, with a good margin, and the biographical notes to each piece are well selected and to the point, and not diffuse. A great deal of information bearing on Burns's character and career is thus combined with his writings. The work is illustrated with engravings of the poet's portrait, views of the house where he was born; a map of the district of Ayrshire associated with the poet, as it was at the close of the last century, and facsimiles of his handwriting.

Here is also a new impression of Joseph Ritson's *Ancient Songs and Ballads*‡, edited by Mr. W. Carew Hazlitt. Ritson, who is described by Lockhart as a "half-crazy," "narrow-minded, sour, and dogmatical little word-catcher," and a "virulent assailant of Bishop Percy's editorial character," did certainly, in the preface to the first edition of the work now reproduced, warn his readers not to expect to find in it either "the interesting fable, or the romantic wildness of a late elegant publication"—this was Percy's—but it would "at least have the recommendation of evident and indisputable authenticity." Whatever may be thought of this attack on the Bishop, there can be no doubt that Ritson had an astonishing store of really valuable learning. His weak point was, as Scott mentions in one of his letters, an inability to combine anything like a narrative, so that his works reminded one of "a heap of rubbish, which had either turned out unfit for the architect's purpose, or beyond his skill to make use of." This is so far true; but, though Ritson's curious collections might, in one sense, be a rubbish heap, they comprised many things of much value, which others were able to turn to better account than himself; and the present work, with all its faults, well deserved to be reprinted,

especially as not only the original edition of 1790, but that of 1829, is now very scarce. Mr. Hazlitt states that it has undergone such changes only as were clearly imperative "in the correction of obvious and material errors, of which the number has proved very considerable, and a few additional notes have been inserted here and there." A useful index and a new glossary have been included in the volume.

The fourth volume of the new edition of Mr. Kinglake's history of the Crimean war* treats of the period from the beginning of the operations against Sebastopol down to the cannonade in the middle of October 1854.

Dr. Blakiston has published a series of lectures on Modern Society† the main object of which, as he states, has been to show "that no lasting improvement in the state of society is likely to be effected that is not based on attention to social as well as religious duties, and that neither of them alone will succeed in imparting to it a rich and harmonious tone." This is rather a large subject, and though the writer's observations on it are sound enough, they are by no means original. The book is, in fact, a mere collection of obvious commonplaces which have long been current and accepted. It is difficult to conceive why any one should think it necessary to inform people that the state of society at any particular period must necessarily be much influenced by the prevalence of various vices, and the performance or neglect of certain duties; that the acquisition of wealth proves a blessing or a curse, a virtue or a vice, according to the circumstances under which it takes place; that there are times when charity calls for something more than the mere bestowal of money; that luxurious extravagance has its origin in self-love and self-indulgence, and engenders a worldly spirit. All this is perfectly understood by every intelligent person, though no doubt it is not always carried out in action. The greater part of Dr. Blakiston's lectures might therefore be taken as read; and when we come to his suggestions for a remedy, they are merely that sort of vague good advice which has no practical value whatever. In one case his cure for extravagant expenditure is to ask people to inquire whether the money they have at command is really their own to do as they like with, and whether every domestic and social obligation is duly provided for. Again, it is suggested that it would be a good thing if there were more sincerity in the world—for instance, in the marriage ceremony, and so on; but this is not a new idea. At the same time, though there is too much of this empty talk, there are also some just remarks on the decline of commercial honesty and the wasteful habits of various classes of the population.

It is eleven years since Mr. R. W. Bians, one of the proprietors of the Royal Porcelain Works at Worcester, and Art Director since 1852, first published his notes on the manufacture of porcelain, and in the interval, as he says, the taste for collecting this ware has become a passion as well as a fashion. The first edition of the work having been for some time exhausted, another has been called for, and the author has taken the trouble, not only to correct and revise, but to rewrite nearly the whole of it, with the addition of new materials and illustrations. Under the title of *A Century of Pottery*‡ he gives an interesting history of the Royal Porcelain Works at Worcester from 1751 to 1851, adding a short account of the Celtic, Roman, and mediæval pottery of the country. The manufacture of porcelain at Worcester is a remarkable example of an imported industry, for it could lay no claim to any one element as indigenous to the locality; and there seems to be no doubt that its establishment was due to political influences. The cloth trade of Worcester had sadly declined, and some of the citizens attributed "the cause of the decay in Worcester to the frequent and expensive opposition for the election of members of Parliament." There were contests between the Jacobite and Georgian parties—the former using any means in their power to secure an electoral triumph, while the latter were forced to bestir themselves in order to recover strength in the constituency; and the establishment of porcelain works was projected and supported in the hope that it would be one of the sources from which Worcester would recover its prosperity and distinction as a manufacturing city. Taken altogether, Mr. Bians's volume is interesting not only from an historical point of view, but as a record of the successful development of an important industry.

Mr. Stephens's lectures on Christianity and Islam§ have the merit of being tolerant and impartial in spirit, and giving a fair view of the characteristics of each form of faith. He does justice to Mahomet in opposition to the estimate which, as he says, in a past age, "condemned Mahomet as a kind of malicious fiend, and his religion as a diabolical invention"—a foolish calumny which, indeed, is apparently not obsolete at the present day. He shows that to his own people Mahomet was a great benefactor, who introduced political organization, rational faith, and, on the whole, an improved morality—a regulated polygamy, for instance, being substituted for unrestrained licentiousness, and the practice of destroying female infants effectually abolished; and that, as Islam

gradually extended its power beyond the boundaries of Arabia, many barbarous races participated in these benefits. At the same time he points out that Christianity and Islam are radically diverse in their essential characteristics, and that the difference between them is not of degree, but of kind; and further, that Islamism has ceased to be compatible with modern civilization.

Mrs. Pfeiffer* has undoubtedly, in a certain degree, the true poetical spirit, and has shown in former works that she can write with feeling and graceful expression, in some cases rising into bolder efforts, though at the same time there are traces of loose style and want of discipline. In the present volume she has made a mistake as to the limit of her powers. In briefer and lighter pieces her work is above the ordinary standard; but she only displays her weakness in attempting a more ambitious task. It is evident that she does not possess, or at least has not yet developed, the sustained power and the ability to keep up continuous interest which are necessary in what, to borrow a French phrase, may be called a work of long breath. There are, no doubt, picturesque and beautiful passages in the poem; but the general result is disappointing, because the action flags and the pervading sentiment is monotonous. The title is *Glân-Alarch: his Silence and Song*—Glân-Alarch being the bard

who sings

Beneath the morning cloud which wraps Crag-Eyrie—

but there are certainly times when we should prefer his silence to his song, for the latter is often very wordy and tedious. Indeed he is never silent, for he is singing the chant from beginning to end. The story is laid in a remote period in Wales, at a time when there was a chronic conflict between the Saxons and the natives. There had been an attack by "the brutal Saxon" Ethelfrith on Bangor Abbey and a massacre of the monks, and an appeal is made to Eurién, the young chief of Crag-Eyrie, to lead a band against the invaders. He swears to take his vengeance when the hour is ripe; but, in the meanwhile, he thinks it prudent for the Welsh to bide their time, and not "brave the high spring tide of Saxon wrath." Mona, an Irish girl who had been in a manner adopted by the chief's mother, and was betrothed to him, seizes her harp and sings a passionate entreaty to him not to let Wales fall "like a stronghold that treason assails," but to make a bold stand at once. This is thought to be a disregard of maidenly propriety, and she is so dismayed by the manner in which it is received that she takes to flight. But now another lady, Bronwen, a widow, had set her eyes on Eurién, and thought this a good opportunity of getting rid of Mona; so she followed her to the mountain where she had been traced, and persuaded her to believe that Eurién's love was very tame and patient, telling her:—

Child, he loves you as his hound,
Stroking your head when you have served him well;
Or as his falcon that he blinds with jesses,
That perches—blindly happy—on his wrist;
So are you hood-winked; but I tell you this;
If Eurién loved you in another sort—
Loved you as man loves woman—if his eyes
Grew hungry as he gazed on you, his kisses
Clung to your lips—it would be he, not you,
Who did this yeoman's service.

She also urges that Mona is not of the nature to suit Eurién, and would only distress him by her impetuous spirit, till the poor girl, in despair, resolves to give up the chief, and plunges over the precipice on which she was standing. She was vainly sought for, and mourned as dead; and Eurién, having married Bronwen, sank into selfish ease and indifference, giving up all thought of revenge on the Saxon. He is roused from this apathy, however, by Glân-Alarch's patriotic stimulus; and when the Saxons again cross the border, they are driven back. In the course of the battle Bronwen is burned in a house fired by the enemy; and Mona, proving to be alive, suddenly reappears in order to become Eurién's guardian angel. In shorter compass this might have made an impressive poem; but unfortunately, though it has some telling parts in it, it is too much spun out.

The author of the poem of *Lochlère*† has a deep conviction of the injury which this country has sustained through the deterioration of the old language during the Norman Conquest, so that it became so corrupted and finally torpid that after the thirteenth century the people "found expression for their ideas in Greek words, and in Latin words formed on the French, or Gaulish model, rather than in words the materials of which might have been found by them in their own mother-tongue so richly." The writer wishes to revive, as far as possible, this language—the English of King Alfred's time—which he considers "more copious and richer than that spoken in Italy in the Augustan period." He acknowledges that he is ashamed to write in the degraded language of the present day, "a virtually dead form of English, debased by a living alloy of Latin, which is corrupted by French spelling and pronunciation, whilst this corruption is again corrupted by English spelling and pronunciation." He consoles himself, indeed, with the thought of "the English Bible, the Elizabethan literature, and the blessed ignorance of literature among our poorer classes"; but this barrier, he sees, is giving way, and an earnest effort must be made to strengthen it. This object, he appears to think, might be furthered by the present

work, in which his aim has been to show that "a poem of several thousand lines may, by the use of not many old words, be written in almost pure Saxon." This, however, has been a laborious and delicate task, for he has had to modernize the old English words he has made use of, and even, "in some cases, to use my privilege as a scôp or poet to coin such as were wanting." We cannot go into the subject of the poem, which is to exhibit a man's state of mind while "he is undergoing that change of heart to God which goes by the name of conversion"; but as an example of the writer's style we may give the following lines:—

Fly, scôpeoð! fly then, on thought's wide wing;
Fly, scôpeoð! fly to the echo's spring.

Hlist! air is hlistig, while it roars:
For yond that roar up upward soars,
Still followed by its eager hlist,
A stefen clear, although so hwist,
A stefen hwist, and yet so clear,
So hwist, so clear, so full, so near,
That louder seems it thien the blast.

Mr. Allingham's new volume of *Songs, Ballads, and Stories** contains a number of pieces now first collected, and others which have been revised and re-arranged; and makes a book into which the reader will find it pleasant to dip, picking out here and there something to his taste. It may be thought, however, that the collection would have been better for compression. Mr. Allingham has evidently a facile command of rhythm and rhyme; but his fluency is apt to run away with him, and his more substantial creations are swamped by a superabundance of slight and trivial verses which in fact are little more than a flux of words. Indeed this is the prevalent fault of Mr. Allingham's style, which, though in its way pretty and graceful, is deficient in originality of idea and intellectual grasp, and produces the impression that he writes too easily to secure concentration of thought. It may be admitted, however, that there are one or two pieces in the volume of a higher grade, such as "A Dream" beginning—

I heard the dogs howl in the moonlight night,
I went to the window to see the sight;
All the dead that ever I knew
Going one by one and two by two—

the "Music Master," and "Mervanuee."

Although Mr. Glanville's *Guide to South Africa*† was written previously to the announcement of the new policy in regard to that region which has just been adopted, it has a special interest at the present moment, as affording a view of the general condition of the various States and of the grounds for the step which has been taken, and which is anticipated by the writer as a future result.

A "Devonshire Justice of the Peace" has compiled a useful and convenient handy-book of the law relating to the duties of his class‡, which he modestly offers, more as a preface to such treatises as those of Oke and Stone, and other legal works, than as a substitute. It may be presumed that there are not a few justices who, at any rate on their first appointment, must be puzzled with the A B C of the law, and here is a plain, practical help for them.

It may be remembered how Coleridge, Southey, and Lovell once sat down for a bit of fun to write a play between them, with Robespierre§ for hero, and how the scheme broke down. Mr. R. H. Patterson, who is known as a successful writer in other branches of literature, has now also tried his hand at a play on this subject; but it cannot be said that he has succeeded, for his work is wanting both in poetical feeling and dramatic animation, and is, indeed, a very prosaic narrative. There is a preface, however, which is worth reading, on the new phase of the drama which has been produced by altered conditions of stage representation and altered tastes. He points out that, as scenery has become more elaborate, simplicity has become necessary in the number of scenes, there being usually but one scene to an act; and thus there has been, in a sense, a revival of the unities of time and place; but he does not think that novelty of story and dramatic surprises can be satisfactorily combined with realistic scenery. He is hopeful, however, as to the future of the poetic drama; and holds that, when the mind is excited and elevated by lofty emotions, speech rises naturally into rhythmic prose, and then into the cadences of blank verse, or into rhythm capped with rhyme. It may be doubted, however, whether rhymed verse is in general suitable for the English stage, though it is used to some extent, and very effectively, by Shakespeare. Still more doubtful is the employment of music, which he recommends, in connexion with highly poetic dialogue and rhymed verse. The difficulty of this is that theatrical elocution, which ought at least to be articulate and clearly heard, is apt to be drowned by the music in a large building.

Mr. Crump has enlarged his work on the origin and uses of banks||, and brought the information down to the latest date. He suggests that what the money market most requires at the present

moment is a representative government—that is to say, that the body of capitalists should be protected against cheats and swindlers escaping the natural penalties of their conduct through the convenient avenues of the Bankruptcy Court, or that still more wide and easy opening, “liquidation by arrangement,” by “some sort of council of bankers to frustrate the designs of such underminers as Collie.”

Mr. Leone Levi's lectures to working-men in King's College, London, on *Work and Pay**, give, in the main, a dispassionate account of the relations between employers and their men, and also a good deal of interesting information as to division of labour, the use of capital in industry, the budget and savings of the working population, and similar topics.

One result of the present war will apparently be a great extension of geographical knowledge in regard to the regions affected by it. There is already quite a shower of maps, and many places never before heard of will now become familiar names, and perhaps obtain a place in history. The principal map-makers have published sheets of different kinds giving all the information required; so that there is an abundant supply. Mr. Stanford has brought out a large map on the scale of fifty English miles to one inch, containing Turkey in Europe and her tributary States, Greece, and such parts of Russia, Austria, Turkey in Asia, and Persia as are immediately connected with the settlement of the Eastern question, thus representing the whole theatre of the war. He has also issued some smaller and more handy maps—one giving the general area of the war; another, Turkey in Europe; a third, Turkey in Asia, with parts of Persia, the Caspian Sea, and the Caucasian Mountains; and a fourth, by Jankowsky, in which the physical features of the seat of war are pictorially represented. Another very instructive map by Mr. J. Arrowsmith, which is published by the same house, is that showing the acquisitions of Russia in Europe and Central Asia from the accession of Peter I. to 1876. Messrs. W. and A. K. Johnston have produced a series of excellent maps, including a war map of Turkey in Europe, with the latest divisions and railways; a political map to illustrate the Eastern question, showing the limits of all the countries bordering on Turkey, and extending from the Baltic on the North to Egypt on the South, Trieste on the West, and the Caucasus on the East; and a war map of Turkey in Asia and Transcaucasia, and the sites of recent engagements. Messrs. W. H. Smith and Sons have prepared a general map showing the entire Turko-Russian frontier in Europe and Asia with clearness and detail. Further, Messrs. Bacon and Co. offer a series of maps illustrating different aspects of the subject, such as a large-scale military map of Turkey; a map of Turkey and Greece; a large print map of the seat of war; panoramic views of the seat of war, and of the whole country from the Mediterranean to St. Petersburg; a map of Southern Russia, the Caucasus, Black Sea, Asia Minor, &c., from Servia to the Caspian Sea, and showing every fortified town; a large-scale military map of the Caucasus; and an ethnographical map of Europe in which the distribution of races is shown at a glance by coloured divisions. We have also received Handke's general map of the Black Sea, with special plans of the Bosphorus and Dardanelles, the passes of the Balkan, harbours of Sebastopol, &c., a marvel of artistic minuteness and distinctness, and apparently the most complete map of the kind; and also his series of special maps of European Turkey, which are equally clear and good.

In the Annual Report of the Commissioners in Lunacy† for 1868, it is remarked that in the legislation on this subject, as on others in this country, defects from time to time become apparent, and there has sprung up such a series of legal provisions that the number of enactments creates great confusion, especially when the practice of referring in later statutes to earlier ones is taken into account. There can be no doubt that the whole law on this subject ought to be carefully consolidated; and as this still remains to be done, Mr. Fry has rendered a useful service in, as far as possible, putting those loose, fragmentary laws together in a connected and intelligible form.

Dr. Williams, the physician of the Brompton Consumption Hospital, in a little treatise on the influence of climate in the prevention and treatment of consumption‡, advises patients who can take a fair amount of exercise without irritation, and have a good appetite, with a diminishing cough, to remain at home; and those who have the disease in an advanced state ought also to do so, because such a change will not yield a sufficient return for the alteration of food, and habits, and the risk of the journey. In some cases a sea voyage does good, but it is a trying experiment. As a rule, dry climates are most likely to arrest the disease, a cold climate being preferable if the patient can bear it; and elevation is of great importance, mountain air being beneficial both on account of its purity and its low barometric pressure and atmospheric rarefaction. But here comes in the question of suitable accommodation. The lesson implied is that climate is only one element in the system of cure.

Mr. Webster has brought together, partly from certain French works, and partly from his own researches, a number of legends §

which are current among the Basque peasants as a contribution to the science of comparative mythology. The writer explains that he was attracted to this subject by the fact of the Basques being a very marked and isolated people, with a language which is peculiarly their own, and is still practically unwritten, and the chance which he thought he saw of discovering legends in a purer and older form than among any other European race. He has found, however, that these legends are in a very loose and confused state, as they are told by ignorant peasants who mix up old and new ideas, and vary or interlard the traditional stories with touches of their own. Thus all that can be got is modernized versions of old legends, few of which seem to be genuinely or exclusively Basque.

The value of Mr. Liszt's *Life of Chopin** as a descriptive work is greatly diminished by the strain of flighty sentimentalism in which it is written. We certainly have it explained to us that Chopin's “best works abound in combinations which form an epoch in the handling of style”; that “his creative genius, imperious, fantastic, and impulsive, was manifested fully only in entire freedom”; that it is to him we owe “the extension of chords, struck together in *arpeggio* or *en batterie*,” remarkable for their “chromatic sinuosities” and “the little groups of superadded notes falling like light drops of pearly dew upon the melodic figure.” But, after all, those who are unacquainted with the peculiarities of Chopin's music would derive only a very vague idea of it from any mere verbal description; and the account of Chopin's character and career is couched in language which, like a cloud of incense, obscures and mystifies the object of admiration. A good deal of space is given to an account of Chopin's music for the *polonaise*, a dance which is supposed to embody the traditional feelings of Poland, and seems to be in its native form very lively and picturesque. Then the writer goes off into a rhapsody about the Polish women, whose movements in this dance have, as we are told, a magic and intoxicating charm. There is also much discussion of the temperament of genius and its inherent melancholy, and we have some glimpses of the master in society. But as a biography the book lacks detail. We gather, indeed, that Chopin was born in 1810 at Zelazowa-Wola, near Warsaw; showed a strong taste for music at nine years old; received a finished education through the liberality of Prince Radziwill; and made his first appearance at Vienna and Munich in 1831, but afterwards, conscious of how much was necessary for the comprehension of his peculiar talent, he played but rarely in public, and gave no concerts except at Paris, where he spent a number of years. “A gnawing feeling of discontent,” we are told, “of which he himself scarcely comprehended the cause, secretly undermined him.” Then there is a mysterious statement that “the tempest which in one of its sudden gusts tore Chopin from his native soil, like a bird, dreamy and abstracted,” “sundered the ties of his first love, and robbed the exile of a faithful and devoted wife, as well as disinherited him of a country.” She remained devoted to him, but somehow the pair never seem to have come together again. He was also much attracted to George Sand, and used to stay with her at Nohant, till a rupture took place. Although of an affectionate nature, Chopin was passionate and eccentric in his conduct. From about 1840 his health began visibly to decline; in 1847 it was very precarious, but he lingered on till October 1849.

* *Life of Chopin*. By Franz Liszt. Translated from the French by M. Walker Cook. W. Reeves.

THE DEBATE.

THE majority of the Government has been unexpectedly large; but in some respects, and especially against his former colleagues, Mr. GLADSTONE has obtained a considerable success. Almost every Opposition speaker, including Lord HARTINGTON himself, expressed a retrospective approval of the policy of coercion. It was of course reasonable to contend that the opportunity of using force was gone by since the outbreak of war; but Mr. GLADSTONE professes to believe that a concert for the joint coercion of Turkey may still be established among the European Powers. At the moderate cost of withdrawing, after the division, the Resolutions which formed the chief subject-matter of the previous debate, Mr. GLADSTONE has proved to the hesitating dissidents among his former followers that he can, whenever he thinks it necessary, determine in great measure the policy of the Opposition. The enthusiasm of the Liberal Clubs in provincial towns is entirely reserved for Mr. GLADSTONE, although Parliamentary members of the party may openly or silently prefer a more cautious leader. Mr. GLADSTONE will perhaps also take credit to himself for the moderate policy and prudent language which he may, on plausible grounds, believe himself to have imposed on the Government. In recognizing the partial adoption of his own views by Mr. CROSS or Sir STAFFORD NORTHCOTE, Mr. GLADSTONE can always taunt the Government with the supposed divisions within its own body. Lord DERBY is sometimes assigned to one section of the Cabinet, or, if it suits the purpose of Liberal speakers, to the other. Mr. GLADSTONE contrasted his language with that of Sir H. ELLIOT; but he added that the opinions of the AMBASSADOR seem ultimately to have prevailed. To the great disappointment of eager opponents, Lord BEACONSFIELD has now for many months maintained an absolute silence on the Eastern question. Some speakers were consequently driven to criticize his almost forgotten speeches at Aylesbury and the Guildhall. There is no reason to doubt that the head of the Government concurs with his colleagues in the neutral policy which they could scarcely have announced without his assent.

The silent Ministerial members may reasonably complain of over-curious observation of their demeanour or of the comparative applause which they bestowed on different speakers. Mr. CHILDERS professed to have watched the faces of the majority during Mr. CROSS's speech, and to have ascertained by their looks that they were dissatisfied with the careful abstinence of the Minister from appeals to national prejudice. Mr. FAWCETT pursued the same line of personal criticism in the contrast which he drew between the reception of Sir ROBERT PEEL's forcible declamation and the calmness which was not disturbed by Ministerial declarations of neutrality. Experienced members of Parliament might be expected to remember that it is not the tendency of temperate expositions of policy to produce the excitement which attends an eloquent, though perhaps injudicious, denunciation of Russia. The avowed partisans of Turkey in the House are few in number, but they probably possess loud voices; and they are naturally stirred by a spirited exposition of their own feelings and wishes. The large majority which supported Sir H. D. WOLFF's amendment for the most part approved the cool definitions of Mr. CROSS and not the invectives of Sir ROBERT PEEL. It is not improbable that one half of the minority may have held almost exactly the same opinions. Mr. FORSTER and Mr.

GOSCHEN, though they had no difficulty in justifying their votes for Mr. GLADSTONE, showed no disposition to adopt his extreme views. Mr. FORSTER candidly admitted that, if Lord DERBY had not done well, he greatly doubted whether any other Foreign Minister would have done better. It is not as easy for a Foreign Secretary as for a member of Opposition to reverse in a few months the political system which had for some generations been maintained by both parties down to the day of the insurrection in Herzegovina. The Ministers have, after a reasonable interval, executed the evolution which ought to have satisfied their opponents.

The debate was, on the whole, of a high order. Mr. GLADSTONE's brilliant oration would alone have relieved it from the charge of mediocrity; and Mr. CROSS's statement had the gravity and significance of an important State paper. Next to Mr. GLADSTONE's, Sir ROBERT PEEL's speech was perhaps the most eloquent, though it contained no useful guidance for the House or the country. Lord ELCHO spoke on the same side with considerable effect, produced by the clear expression of strong convictions. Mr. BRUCE, to whom it is perhaps, in the eyes of zealous partisans, a drawback that he knows Turkey well, was at the same time moderate and instructive. On the whole, the Government and its supporters were scarcely a match in debate for the Opposition. The Ministers, prudently unwilling to disturb the impression which had been produced by Mr. CROSS, took little part afterwards in the debate. Lord JOHN MANNERS, by an odd coincidence, defended the policy of the Government at the same time at which the Duke of Rutland was assuring the House of Lords, on the authority of a Correspondent of the *Daily News*, that Lord DERBY's answer to Prince GORTCHAKOFF had produced consternation at all neutral Courts. Sir STAFFORD NORTHCOTE, by virtue of his position, was compelled to speak at the close of the debate; but he thought it prudent to deal with incidental questions which had arisen in the course of the discussion, and to leave as little opening as possible for Mr. GLADSTONE's impending reply. Mr. HARDY, perhaps not unwisely, declined to take part in a debate which might have given him occasion to assume the appearance of dissent from some of his colleagues. Some of the younger members of the Government were substituted for their official superiors. Lord SANDON made an animated attack on Mr. GLADSTONE; and Mr. BOURKE delivered a speech in mitigation of Turkish perversity which was naturally censured by the Opposition. Mr. FORSTER, Mr. GOSCHEN, Sir WILLIAM HARCOURT, and Lord HARTINGTON were perhaps on the whole superior to the champions who had been selected by the Government. They all possessed and felt the advantage of comparative irresponsibility. They had vindicated their sound judgment by refusing to vote for Mr. GLADSTONE's original Resolutions; and, when he modified his plan of action, they were at liberty to defend in their speeches proposals which would never have been sanctioned by their votes. Of all the members of the former Cabinet, Lord HARTINGTON was, with the exception of Mr. GLADSTONE, most hostile to the Ministers.

The debate would perhaps have been still more animated if the issues which were raised had not been already obsolete. Diplomacy has done its work, well or ill, and no protocols or memorandums will affect the fortune of the war. When the SULTAN first addressed his new Parliament he stated that he had been unwillingly compelled to call 700,000 men to arms. If he could dispose of two-thirds

of that number of regular soldiers, he might carry on a defensive campaign with fair prospects of success. Unfortunately for the Turks, the enemy are both in Europe and Asia greatly superior in numbers, and they have probably the advantage of better organization and of abler generals. The Russians have no difficulty in securing a passage of the Danube by taking advantage of their superior numbers to threaten the enemy at different points. It is expected that when they have reached the right bank they will content themselves with masking the fortresses, and advance at once to the Balkans. An active and skilful general might perhaps in such a case interrupt or threaten their communications, but none of the Turkish general officers have any considerable reputation for military ability. The events of the simultaneous campaign in Asia are as yet imperfectly known. The Russian generals have reported to their Government several alleged successes in trifling skirmishes; and the Turks on their part have accomplished or imagined a not inconsiderable victory in the neighbourhood of Kars. It seems probable that the Russians may have incurred a check in the neighbourhood of Batoum; and it is reported from Constantinople that the Turks have successfully bombarded the fortifications of Soukoun-Kaleh, and, with the assistance of the native population, driven out the Russians. The main object of the Russians is probably to take Erzeroum, which is not sufficiently fortified to offer serious resistance. Only military critics will be able to judge of the prospects of the war either in Europe or Asia, if the campaign should be prolonged or doubtful. For the present it may be assumed that a great superiority of force will insure the success of the Russian armies, in spite of occasional checks. Even the slow progress of the army through Roumania indicates a deliberate purpose.

THE CRISIS IN FRANCE.

THE French Left are now reaping the harvest which they sowed when they forced M. DUFFAURE to give place to M. JULES SIMON. In so doing they were acting well within their constitutional rights, and they had not learnt that a political party may keep within its rights and yet go beyond all bounds of prudence. The Left showed praiseworthy caution in the late Assembly, because they were not exposed to the temptation of finding themselves in a large majority. But their successes in the elections turned their heads. They thought that the Republic had come safely through its trials, and that nothing was now left them but to enjoy the fruits of victory. It was plain that under M. DUFFAURE this enjoyment would only be vouchsafed in a very moderate measure. M. DUFFAURE's devotion to the Republic was of a type which the Radical Left thought scarcely better than the devotion of Marshal MACMAHON's earlier advisers to Monarchy. What is the good of having a majority if you may not do what you like with it? When the Conservatives came into power in this country, there were doubtless many secret heartburnings at the paltry use they made of their opportunity. But the English Conservatives did at any rate see their leaders in office; whereas the French Left had not even this consolation. They commanded the votes of two-thirds of the deputies, and all the benefit they got from it was the substitution of M. DUFFAURE for M. BUFFET. Yet, as we pointed out at the time, this irritation, though exceedingly natural, was also exceedingly imprudent. M. DUFFAURE had been frankly and heartily accepted by the MARSHAL, and so long as he remained Prime Minister the Republic was perfectly safe. M. DUFFAURE might be intensely Conservative; but at all events his Conservatism was of that genuine kind which aims at retaining and making the best of existing institutions. The Ministers who had preceded him since the fall of M. THIERS had all been suspected of secretly plotting against the Republic of which they were professedly the servants. No such charge could be brought against M. DUFFAURE; and with this honest acceptance of the Republic he combined the inestimable advantage of not being enough of a Republican to make the MARSHAL uneasy. The true policy of the Left would have been to rest content with M. DUFFAURE until such time as the MARSHAL either laid down his authority or became more disposed to regard himself in the light of a Constitutional President.

The Left preferred to have a Minister of their own choosing, and the MARSHAL went the length of accepting M. JULES SIMON. Unfortunately for France, the un-

wisdom which had prompted them to quarrel with M. DUFFAURE prompted them to demand more from M. SIMON than, with Marshal MACMAHON as President, it was possible for a Minister to give and yet remain Minister. M. SIMON would have had a sufficiently difficult part to play if his party had been perfectly manageable; but when, instead of this, they showed themselves determined on every possible occasion to take their own course, and to leave the Minister no alternative but either to follow or be left in a minority, the part, from being difficult, became impossible. M. SIMON probably went further than the MARSHAL liked in his first speech to M. LEBLOND's interpellation; but when, twenty-four hours later, he accepted what amounted to a vote of censure, and publicly promised to amend his ways and do better, the MARSHAL's patience ran out. The same motives which led him to send the curious message that the PRESIDENT would resolutely repress Ultramontane demonstrations would equally lead him to avoid putting his breach with M. SIMON on the true ground. Avowed sympathy with Ultramontanism means danger abroad, and the MARSHAL is too good a Frenchman to provoke this, if it can be avoided. Accordingly the MARSHAL set to work to invent a reason for dismissing M. SIMON which should have no apparent connexion with the ecclesiastical debate. He found one in the circumstance that M. SIMON had not opposed the repeal of certain clauses of the Press-law passed two years ago. It is probable that M. SIMON, who does not despise the art of being all things to all men, had spoken more strongly against the repeal in his interviews with the MARSHAL than he thought it prudent to do in the Chamber of Deputies. This may have armed the MARSHAL with the telling inquiry whether the head of the Cabinet retained the influence over the Chamber which is necessary to make his own views prevail. From the moment that this question was asked there could be no doubt as to M. SIMON's course. It would have been useless for him to assure the MARSHAL that he did possess sufficient influence over the Chamber to ensure the adoption of his views, for on the first occasion on which this assurance had been tested it would have been disproved. M. SIMON's views prevail in the Chamber when, and only when, they are in accordance with M. GAMBETTA's views. The Left have taken care to make this fact perfectly plain to the most careless observers, and it has no doubt been again and again impressed on the MARSHAL by those personal friends whose advice is supposed to have more weight with him than that of his acknowledged Ministers. M. SIMON answered the MARSHAL's letter by an offer of resignation, which was at once accepted, and for twenty-four hours Paris was given up to speculations as to M. SIMON's successor.

For a time it was thought that the MARSHAL's blow might only have been aimed at M. SIMON, or that at least he would be content with a genuinely Republican Minister, provided that he were unmistakably a Conservative. The President of the Senate would have answered to this description; but it is improbable that so prudent a personage as the Duke of AUDIFRETT-PASQUIER would have consented to take office in direct opposition to a Parliamentary majority. If any man was to do this, it must be a politician who, having accepted the fact that his views were not in accordance with those of the Chamber of Deputies, would be willing to set to work to create a Chamber of Deputies in accordance with his views. Under these circumstances there was really but one man who could fill M. SIMON's place. Whether the Duke of BROGLIE was or was not included in the new Cabinet, or whether, being included in it, he did or did not take the post of First Minister, he must equally be the inspiring and informing spirit of every possible combination. He is the acknowledged chief of what may be called the Opportunist Right—of the Right, that is to say, which aims at uniting Legitimists, Orleansists, and Bonapartists in a common opposition to the Republic, and is willing to leave to the future the decision which of these parties shall profit by victory. It is upon this coalition that the MARSHAL is now thrown back, and the first condition of enjoying its confidence is willingness to govern the Republic in the interest of some form of Monarchy. The Duke of AUDIFRETT-PASQUIER would be no more acceptable to the coalition than M. SIMON himself; and if the Duke of BROGLIE is to be Minister in fact, it is better that he should be a Minister in name.

M. GAMBETTA's speech forebadows the nature of the opposition which the Chamber of Deputies will offer to

the new Cabinet. He was wisely /refal to dissociate the MARSHAL from his advisers. His references to the PRESIDENT of the Republic were throughout respectful, and even complimentary. All his condemnation was reserved for the mischievous advisers who had unfortunately got possession of him. The Chamber did not separate until it had passed an order of the day by which its confidence is denied beforehand to any Cabinet which is not free in its action, and resolved to govern according to Republican principles. As neither of these qualifications will be forthcoming in M. DE BROGLIE's Cabinet, an occasion of placing it in a minority will be used as soon as it presents itself. It is believed that the Cabinet will postpone this inevitable defeat by an adjournment for a month, and that the interval will be spent in thoroughly purging the Administration of the Republican leaven which has been introduced into it since M. BUFFET's retirement. Prefects will once more be chosen for their devotion to moral order, and their detestation of the Republic in whose name their commissions will run. When the machinery for managing the elections has thus been provided, the Cabinet will meet the Chamber, will accept its censure with a light heart, and will try the experiment of a dissolution. Why the Duke of BROGLIE should expect this experiment to have a different issue under himself from that which it had under M. BUFFET is not clear. M. BUFFET was not sensitive about the nature of the methods employed on behalf of the Government; and the electors who were then determined to return a Republican majority will probably be equally determined to return one now. The genuine supporters of the coalition are no more numerous in the country than they are in the Chamber; and the moderate Conservatives are not likely to rally round an Administration which they will distrust for its supposed monarchical leanings as much as they distrusted the late Administration for its supposed Radical leanings.

GERMAN PARTIES.

AN article in the *Fortnightly Review* discusses and explains the present composition, aims, and prospects of the parties which make up the German Parliament. The author brings to his task much local knowledge and a long acquaintance with the persons and classes he is describing. There is, therefore, much to be learnt from his essay; but it would be more valuable if it showed the power of grasping the subject as a whole, and if one could gather from it that the critic has some definite principles of criticism. It is an expression of that pessimism which so often characterizes the studies of Englishmen on a foreign country in which they happen to reside. Nothing goes on exactly as they would wish, and foreigners will not behave as if they were all living in London. With the writer in the *Fortnightly* everything in Germany is going on as badly as possible. The parties are absurd, the men who lead them are foolish, the Empire is a mistake, German unity is a delusion, Prince BISMARCK is arrogant and shortsighted. On one party alone he looks with kindly and indulgent eyes. He cannot say too much in praise of the Ultramontanes, with their admirable Parliamentary tactics, or of their leader, Herr WINDTHORST, "the little deformed man, with the lips of a negro slave, but the tongue of a CATO or a TALLEYRAND." They and he really are clever people, who know what they mean and how they mean to get it. They have found out that the dogma of infallibility and the Syllabus are not to be taken literally. They understand that the Church cannot rule the world, and so they have political, not ecclesiastical, aspirations. They aim at something practical, and aim at it in a very practical way—the way, namely, of Parliamentary tactics, and of forming a compact little group which joins this or that section with indifference, so that some progress can be made towards the great end which they are labouring to reach. When we ask what this great practical end is, we find that it is the ruin of the German Empire and the dissolution of the German union. This, if might have been imagined, is exactly what Prince BISMARCK has always said of them. But then whatever Prince BISMARCK says or does must be wrong. Great fault is found with those who adopt the language of Prince BISMARCK in the German press, and say that the Ultramontanes, like the Socialists, are the enemies of the State. This the writer in the *Fortnightly* considers a fallacious mode of putting things. The Socialists really are enemies of any State at all like

the States known to Europe; but the Ultramontanes do not in the least object to a State; they only want it to be one with which they can work in harmony. It seems hardly worth the trouble of living in Germany and studying German parties to have arrived at the conclusion that in this sense the German Ultramontanes are not the enemies of the State. No one in or out of Germany ever dreamt that they were. No one could possibly suppose that the German Ultramontanes would not be perfectly satisfied if they could get a Germany composed of small States resembling Parma, Modena, and Naples. What they make war on is the State as now established in Germany. With an Ultramontane majority in the German Parliament German union would not be worth a week's purchase. The Ultramontanes do not indeed hope for a majority as things are now in Germany; but they hope by skilful management to make the working of the machinery of the present German State impossible. If they cannot crush it, they may hope to spoil it; and why Prince BISMARCK, who invented this machinery, and would like to see it going on in full play, should not point out the aims of those whose wishes and efforts are centred in a direction precisely opposite to his own, and should not explain to his countrymen that they cannot at once support German unity and triumphant Ultramontanism, it is very difficult to conceive.

The author draws attention to one striking point of contrast between France and Germany. In France probably even a greater bitterness of feeling divides parties than in Germany. Nothing can exceed the hatred of a Republican towards a Bonapartist, or the hatred of a Bonapartist towards a Republican. The Clericals think the Extreme Left a crew of raving sinners; the Extreme Left denounces the Clericals as the enemies of mankind. But all parties contemplate France as an undivided whole, which, if possible, they are to get into their power. In Germany half of the Parliamentary parties wish, not to control the country, but to break it up. It is the existence of the order of things under which they live that is the object of their attack. The Ultramontanes, the Socialists, the Poles, and the little fractions of Danes and Alsations wish either to sever all connexion with Germany, or to transform it. It is as if an English Ministry were confronted by four sets of Home Rulers. The other four Parliamentary parties wish to uphold Germany as it is at present constituted, although they vary in their views as to what is to be done with Germany if it be kept in existence. There are the old Conservatives, who represent chiefly the landed proprietors of Prussia, and who would like to see all Germany governed on the ancient Prussian pattern. They may not have any great affection for the Empire, for it is a newfangled and perhaps dangerous institution. But still the King of PRUSSIA is its head, and if Prussia could but return to the type it presented in the last century, and domineer over all Germany as much as could be wished, things might be very comfortable even with an Empire and an Imperial Parliament. Then there is the official Conservative party, which has to please the Court and exhibits that shade of Conservatism which finds favour in high quarters. This party is numerically small; but its members enjoy for the most part some kind of prominent position, and its especial function is to supply Ministers to work under Prince BISMARCK, and to serve him or thwart him as seems most convenient and profitable. Lastly, there are the two great Liberal parties—the party of Progress, which loves Germany and the Empire and the union, but longs to see the new institutions turned to some more effective purpose than has hitherto been accomplished; and the National Liberal party, which is simply and purely Bismarckian. Its liberal aspirations are tempered by gratitude to Prince BISMARCK for having created Germany, and by a constant apprehension that, unless Prince BISMARCK has his own way in everything, he will get angry, and then his creation will fall to pieces. This party has been the instrument by which Prince BISMARCK has hitherto ruled. But the recent elections showed that it had lost ground. The author of the *Fortnightly* article inveighs in the severest terms against its servility and its want of courage; and it cannot be denied that it has made sacrifice after sacrifice to please its imperious leader, and that it manifests an absence of healthy confidence in itself and its country when it is found ready to proclaim on all occasions that without BISMARCK all is lost.

A wave of reaction has swept over Germany as over

many other countries in Europe, and the Empire has now to encounter greater trials and dangers than have hitherto threatened it. The voice of little men is heard, and the stir of little interest is felt, when great things have been accomplished and the enthusiasm they have awakened grows faint. These symptoms of dissatisfaction in Germany are not to be despised. The author tells a curious and significant story as to this dissatisfaction. The MINISTER of the INTERIOR was declaiming against the Socialists and their ignorant dupes, when Herr WINDHORST rose and said that the Minister appeared to be labouring under some misapprehension as to the character of the supporters of the Socialist candidates, as he himself had watched the proceedings at the election, and could state, on the witness of his own eyes, that a large proportion of the supporters of the Socialists had been men with the dress and look of gentlemen, who had taken this means of showing their strong personal dislike of the order of things they found established. And while the enemies of the Government are certainly not to be conciliated, its friends are very much divided; for the old Conservatives and the party of Progress pull in precisely opposite directions, and the official Conservatives get all the sweets of office, which the National Liberals work in such a painful way to secure to them. But the author probably underrates the strength and security of the Empire. He acknowledges that the bulk of the educated classes and the majority of the people are firmly attached to it; that there is much honest pride in what has been accomplished; and that the mere thought of disruption is grievous to patriotic Germans. But he seems to think that no one besides Prince BISMARCK and the National Liberals has contributed to this result. This is scarcely fair. Others have at least acquiesced in it and done something to promote it. The EMPEROR, more especially, has won many victories over himself, over his scruples, his prepossessions, and his fears, during the long process by which he has been gradually taught what it really means to be Emperor of GERMANY. The minor States have also yielded much and agreed to much that must have been distasteful to them, in order that Germany might be united. Little bursts of jealousy, and a wish to show that some real power is still left them, must not be misinterpreted into a desire to upset the great work in which they have taken part. On the other hand, the opposition to which the Empire is now exposed affords some justification for the resolution of Prince BISMARCK not to go too fast and too far in the way of Liberalism, and for the readiness of the National Liberals to follow him in the path of caution. The EMPEROR, the Prussian aristocracy, the rulers and Ministers of the little States, the army, the military position of Germany, had all to be taken into constant account; and it is in a great measure because Prince BISMARCK did constantly take them into account, and the National Liberals, although with sore hearts and many murmurs, trusted him and recognized the necessity of his taking them into account, that the reaction is not more powerful and more bitter than it is now. The struggle is by no means over, but, on the contrary, may become more intense; yet it does not follow that reaction will win in the long run, and there does not as yet appear to be any solid reason why Germans should despair of Germany.

MR. BRIGHT AT EXETER HALL.

MR. BRIGHT's speech at Exeter Hall must have seemed conclusive to his audience, and especially to the farm-labourers who had been brought to London to attend the meeting. In accordance with his uniform practice, Mr. BRIGHT summed up modern English history as a record of progress uniformly coincident with the extension of democratic power. The early part of the century was occupied by unjust and costly wars promoted by a selfish oligarchy, who also imposed vexatious restrictions on the press, on the right of meeting, and on personal liberty. To themselves and to the world at large Englishmen of sixty years ago seemed to be the freest of mankind; and the long and eventually successful struggle against the military despotism of NAPOLEON was regarded as the most glorious among the national recollections; but the labourers who met at Exeter Hall will accept Mr. BRIGHT's doctrines, and they will never hear the other side of the question. In due time came the Reform Bill, the Repeal of the Corn-laws, and at last the establishment of household suffrage in

boroughs and of vote by ballot. Mr. BRIGHT is not mistaken in his conviction that he belongs, and has always belonged, to the winning or stronger party. His sanguine hope of the admission of county householders to the suffrage is combined with a slight feeling of regret that the demand is not at present supported by an exhibition of physical force. Mr. BRIGHT may claim the credit of having first proposed the mob meetings on behalf of reform of which the most conspicuous exploit was the demolition of the railings in Hyde Park. A much larger meeting at Birmingham had less effect in alarming the Conservative party, because it is only in London that mobs can attempt directly to intimidate Parliament. As Mr. BRIGHT admits it is less easy to assemble great multitudes in thinly-peopled country districts; but he suggests that the boroughs may in this respect come to the help of the counties, and reproduce the crowded meetings of 1866. If such gatherings can be organized, there will be no difficulty in finding plausible arguments for an equalization of the franchise. Even if discussion were permitted on such occasions, the reasons of the opponents of the measure would not meet with popular acceptance.

If the right of voting were a personal pleasure or privilege, the most obstinate Conservative would not refuse to farm-labourers a gratification which is enjoyed by workmen who happen to live in boroughs; nor is there any weighty reason against electoral uniformity except that it would place all political power, even more than at present, in the hands of a single class. The speakers at the Exeter Hall meeting complacently enumerated the supposed abuses which are to be suppressed when the farm-labourers assume their share in legislation and government. The Game-laws are of course to be abolished, and it may be added that care will be taken to prevent the institution of an effective law of trespass. The distribution of landed property is in some unexplained manner to be readjusted, so that a future Mr. BRIGHT will not be able to elicit cries of "Shame!" when he shows that the bulk of landed property in England is possessed by a small minority of the population. Other speakers boasted that the labourers would also control the foreign policy of the Government, by preventing wicked Ministers from plunging the country into an immoral and disastrous war. As the object is already accomplished, it seems unnecessary to remodel the constituencies in consequence of the Bulgarian atrocities; but it is substantially true that the revival of democratic excitement is closely connected with the anti-Turkish agitation. Those who consider that uninstructed sentiment has already exercised at least sufficient influence on national policy will bear with patience the adjournment of the happy time when public affairs will be still more entirely withdrawn from the control of responsible statesmen. It was always probable that the farm-labourers would support the most extreme doctrines as soon as they began to take part in politics. Their principal leader has, as might be expected, joined in every recent political agitation. The whole weight of the new county voters would, if Mr. TREVELYAN's Bill were passed, be thrown into the revolutionary scale.

The same measure would destroy the virtual representation of minorities which is provided by the unequal distribution of electoral power. Small boroughs could not long survive the establishment of a uniform suffrage. The same politicians who now plausibly complain of the disfranchisement of a man because he is separated by a rivulet or a road from the precincts of a borough would indignantly ask why the same arbitrary frontier should determine the comparative voting power of the residents on either side. One of thirty thousand electors is supposed to be unfairly treated because his neighbour has a three-thousandth part in the choice of an equal number of members. The distinction is still possible, while counties and boroughs are represented on different principles; but universal borough suffrage would produce an irresistible demand for equality of electoral districts. When the change was once effected, it might well happen that the wealth and intelligence of the country would be practically excluded from political power. In the model borough of Birmingham the party which probably has a majority among the upper classes of the community is not only left without Parliamentary representation, but is permanently excluded from all share in municipal activity. For all electoral purposes the town is managed by a permanent Liberal Club, which effectually discharges its duty of maintaining in all things, large and small, the supremacy of a single

faction. It would be easy to establish a similar organization in any county in which the labourers formed the majority of the constituency. The gentry and the farmers would be excluded from public life, unless they thought fit to obey the orders of Mr. ARCH or some other popular manager. Mr. BRIGGS is perhaps sincere in his hope that the new county constituencies would prefer candidates on account of their genius or virtue; and it seems to him scandalous that the principal persons in a county should, when a vacancy occurs, nominate one of their own families or friends as a candidate. In every electoral system candidates must be chosen by a few leading persons; and, on the whole, the gentlemen of a county seem not to be more objectionable agents for the purpose than professional politicians of the American type.

There is no reason for withholding the representation of counties from the labouring population, except that the change would, in the opinion of those who oppose Mr. TREVELYAN's Bill, be injurious to good government and to the public interest. It is not surprising that the advocates of the measure profess not to understand arguments which have no relation to the rights of man or the rights of the householder. The question whether the extension of the suffrage will be soon conceded or indefinitely postponed depends principally on the will of the farmers. The Ballot has transferred the county representation from landlords to tenants; and both will be simultaneously swamped by the enfranchisement of the labourers. Since the beginning of Mr. ARCH's agitation the farmers have had some practical experience of the operation of the Labourers' Union. They are probably not disposed to increase the political power of a class which has caused them so much social and economical annoyance. The Conservative party, notwithstanding the inclination of its chief to tamper with the question of suffrage, is unanimously opposed to a change which would greatly increase the strength of the democratic party. The moderate Liberals also dislike Mr. TREVELYAN's scheme; but, on the other hand, Mr. GLADSTONE, who is every day more and more visibly resuming the lead of the party, has now for several years supported the equalization of the suffrage. On the eve of his dissolution of Parliament, he had agreed to receive a deputation on the question of county suffrage, with the obvious purpose of making the change of franchise a Ministerial question as soon as he could convert his dissentient colleagues. Mr. FORSTER differs on this point from Mr. LOWE, from Lord HARTINGTON, and probably from Mr. GOSCHEN. It may be admitted that the supporters of the uniform franchise have powerful representatives in the House of Commons. Mr. GLADSTONE, Mr. BRIGGS, Mr. CHAMBERLAIN, and Mr. COURTNEY can give effective aid to Mr. TREVELYAN and Mr. FORSTER. The present House of Commons will be deaf to their arguments and their threats; but the next election may reveal many not less startling results of the Bulgarian massacres.

THE RIDSDALE JUDGMENT.

THE *Record* borrows its appreciation of the RIDSDALE Judgment from ANDREW FAIRSERVICE's estimate of ROB ROY:—"It is a Judgment with which neither party in the Church can be expected entirely to acquiesce, and it will require caution and consideration to estimate the comparative amount of support or damage which the old Reformation ritual has sustained from the doubtful terms in which the charge against the appellant in regard to the Eastward Position, as we understand it, is treated as 'Not Proven.'" No one who is familiar with the *Record* would suspect it of unprovokedly blowing its trumpet with so uncertain a sound; so we may take this depreciatory estimate at its full value. The Eastward Position was, so it says, only "Not Proven"; everything else in that document turned out in the best possible way for the interests of the Church Association, and yet the *Record* is uneasy. All this shows that "Not Proven" is the *Record's* playful way of making things pleasant to the persecutors who are so unceremoniously pulled up in their agitation to restrain public worship within the narrowest limits of a repulsive puritanism. The question of the Eucharistic dress is of less importance, and it affects fewer persons; nevertheless, it is not a matter which could in the present temper of the religious mind be safely played fast and loose with; while we have the volunteered assurance of the *Record* for saying that those who care for it

must not be expected entirely to acquiesce in the judgment. Whatever we may think of the dresses, there can be no doubt that the reasoning by which the Court either forbids or allows them concerns that wide circle of persons who have never seen, and who never wish to see, a chasuble, but who are jealous that the stream of English judicial interpretations may not, as it goes broadening on from precedent to precedent, become proportionately shallow. In their interest we propose to consider the argument by which the Ornaments Rubric was proved to be of the class of words intended to conceal thoughts. The reasoning was very technical. It starts from the known fact that, on ELIZABETH's accession, High and Low Church were in sharp antagonism, and that, by way of keeping the peace, the authorities re-enacted the Low Church Prayer-Book, while—for the time being at all events—they reinstated the higher ceremonial of EDWARD's first book by this clause in the Act of Uniformity of 1559:—

"Provided always, and be it enacted, that such ornaments of the Church, and of the ministers thereof, shall be retained and be in use, as was in this Church of England by authority of Parliament in the second year of King EDWARD the Sixth, until other order shall be therein taken by the authority of the QUEEN'S Majesty, with the advice of her Commissioners, appointed under the great seal of England for causes ecclesiastical, or of the Metropolitan of this realm."

This direction was repeated in a rubric of the contemporaneous Prayer-Book in slightly varying language, and with the omission of any reference to the possibility of other order being taken. As to this rubric, which, we are told, was not inserted by any authority of Parliament, the Judicial Committee—adopting a theory of Bishop GIBSON's which seems rather to savour of the theological than the legal mind—says, "It was meant to be a compendious and convenient summary of the enactment on this subject." This sort of sliding-scale estimate of the value of rubrics is certainly bold; but anyhow, if ELIZABETH never acted under the powers of the statute, the clause in the Act of Parliament must have continued operative. But in 1566 certain "advertisements" were published by PARKER and the other Ecclesiastical Commissioners in the QUEEN's name, though neither signed by her nor issued under her broad seal. Supposing these orders to have been valid in spite of these deficiencies, they may be taken to fulfil the conditions of the statute. Competent authorities have deemed the want of those formalities fatal; but the Judicial Committee, on a review of collateral considerations, judges otherwise, and assumes that until 1662 the advertisements prescribed the law of ritual dress—namely, the cope in cathedral and collegiate churches for the Communion Service, the surplice at all other times and places. In 1662, as there can be no doubt, the whole Prayer-Book with its totality of rubrics was enacted as an integral portion of the Statute of Uniformity. In this statute the Ornaments Rubric was recast so as to make its language textually correspond with the statute of ELIZABETH, minus its qualifying provision:—"And here it is to be noted, that such Ornaments of the Church, and of the Ministers thereof, at all Times of their Ministration shall be retained, and be in use, as were in this Church of England, by the Authority of Parliament, in the Second Year of the Reign of King EDWARD the Sixth."

This is the existing statute law upon ministerial attire, enacted without reference backwards or forwards to advertisement or anything else, except to one thing, the "authority of Parliament in the second year of EDWARD VI."; and the opinion has accordingly prevailed that to this "authority"—i.e. to the Prayer-Book of 1549—recourse should be had for further explanation. The judgment itself puts this view very clearly for the purpose of knocking it down. The Rubric of 1662 "is now the only law as to the vesture of the clergy. It contains within its one sentence all that is now enacted upon that subject. It sweeps away all previous law as to the vesture of the clergy, whether that law was to be found in Statute, Canon, Injunction, or otherwise. It authorizes the use of all ornaments which had the Parliamentary authority of the first Prayer-Book of EDWARD the Sixth. The vestments in question are among the ornaments which had this Parliamentary authority; therefore it authorizes the use of the vestments in question."

The counter theory of the Judges is that the advertisements, whose legality is *ab initio* not unquestionable, and

which are in no part of the statute of 1662 so much as referred to, must be held as revived by being ignored, and that the Ornaments Rubric is to be read as if they formed a portion of it.

The upshot of the reasoning is that the rubric—i.e. the statute law of the land—is to be taken with a huge *subauditoe*, and that when it says that such and such ornaments are to be retained and be in use, it really enacts that those ornaments are not to be retained nor to be in use if they happen to have been excluded by some advertisements of ninety-six years before, to which that statutory rubric carefully, and as if on purpose, refrains from making any reference. We simply state the argument as we find it, and bow before the mystery of Privy Council law. Whether or not these conclusions will ultimately stand, there can be no doubt that it is profoundly unsatisfactory to find that questions which so deeply stir the feelings of living men, and of active religious parties, can only be solved by subtle arguments on the mutual relations of obsolete documents, of which the legal validity is one of the questions about which the deepest uncertainty exists. Mr. RIDSDALE kept or broke the law according as the silence of a statutory rubric two hundred years ago did or did not involve a crypto-reference to the recommendations of a Commission of the preceding century, of which the most which can be said is that Queen ELIZABETH may be assumed to have given to it her constructive sanction. The Dean of St. PAUL's and his friends may have been indiscreet in invoking the living voice of the Church; but they were hardly foolish in their prayer.

If we turn from these bewildering disputes on ambiguous words to the subject matter in controversy, we shall find that the Judges have been compelled to reach the practical conclusions of one side on the principles of the other; and, in according a material victory to Low Churchmen, to accept the theory of the higher party. The controversy over a distinctive Eucharistic dress—disregarding such niceties as the competing claims of chasuble and cope—turns on one simple question—Is, or is not, the Communion Office so much higher in kind or in degree than any other public rite as to require another and a richer *mise-en-scène*? As now, so in ELIZABETH's days, this question divided Church parties, and the advertisements were intended—irrespective of their legal force—to compromise the discussion, as compromises were understood and worked by the prelates and statesmen of the Tudor QUEEN. The side to which, at all events, the QUEEN and the Archbishop leaned was gratified by the principle of the higher and richer *mise-en-scène* being recognized in the more stately fanes in which alone so mighty a princess would take an immediate interest, while the sufficiency of the surplice for the squalid ruck of parish churches was conceded to Puritan susceptibilities. In our own days the controversy is over those parish churches, and the Judicial Committee establishes the practice of the surplice by a document of which the principle is the superior authority of the cope. In ELIZABETH's time "cathedral" and collegiate churches (with which were classed both college and the royal and episcopal chapels) were the only places which were usually served by more than a single minister, or were sure of means to make ends meet. In short, making allowance for different times, the advertisement was equivalent to an order now from Archbishop TAIT that in every church which can show three or four curates copes must be found. Plainly it justifies the vestment theory, except upon the extravagant contention that ELIZABETH's reformers regulated the establishment on the principle that, in proportion as a church was important, so it should be licensed to act superstitiously. Either PARKER and his colleagues thought that the cope was the right dress at Communion time where circumstances concurred to make it possible, or they stood self-convicted of having set their hands to a meaningless and unprincipled arrangement. Similar considerations will explain the motives which led the revisers of 1662 to frame the present Ornaments Rubric while they refrained from driving it home according to its literal meaning. The advertisements were in their eyes no new law; but a current *modus vivendi* in the spirit of which they were still willing quietly to act. So their leader COKE was content to press the surplice on his diocese, while he stuck to the cope in his cathedral.

To sum up the losses and gains which the disputants realize from this judgment, Low Churchmen find themselves absolutely unmolested in all their own peculiarities,

while they receive the justification of seeing their opponents restricted in things which they care for. Churchmen have nothing to complain of, or to agitate about. The other side may reckon to the good that the allowance of the Eastward Position, the compulsion of the cope in the higher order of churches, and the reassertion of the religious use of imagery as contained in the Exeter Reredos judgment—following upon the permissions long since given in LIDDELL v. WESTERTON—vindicate for the Church of England, by the decision of the highest appellate jurisdiction, the possession of that ideal of worship—corporate, historical, and artistic—which corresponds with the convictions of the High Church party. With so much to satisfy them, however, they are quite unable to follow the reasoning which constrains every prebendary of St. Endellion and Heytesbury and every brother of St. Katharine's to assume his cope, while it would expose the Vicar of Margaret Street to Lord PENZANCE's ire if he dared to appear in any richer dress than his surplice. If they desire success and not notoriety they will net what they have got, avoid Lord PENZANCE's Court, protest if it comforts them, and move by constitutional ways to secure more elastic and practical rules of worship than the inductive interpretation of antiquarian documents of doubtful origin and ambiguous value.

POLITICS AT WHITSUNTIDE.

PARLIAMENT has done but little since the beginning of the Session, and it has little left to do. No serious interest has been felt in anything unconnected with the war in the East; and, unfortunately, the progress of Russian conquest is beyond the control of the House of Commons. The Burials Bill will cause more excitement during its next stage than it has done in the calm atmosphere of the House of Lords. It is not easy to think of any other measure which is likely to produce an animated debate, unless Mr. TREVELYAN can invest his scheme of household suffrage in counties with some novel attraction. The disinclination to domestic changes which was expressed in the result of the last general election, still probably prevails; but the anti-Turkish agitation may not improbably revive the activity of the party of movement. Mr. CHAMBERLAIN on a late occasion suddenly converted a meeting of Nonconformist agitators into a society for the support of Mr. GLADSTONE's foreign policy; and, conversely, disapproval of Lord DERBY's diplomatic proceedings will perhaps hereafter take the form of active hostility to the Church Establishment. The section of the clergy which sympathizes on ecclesiastical grounds with the Greek and Bulgarians is also, for well-known reasons, hostile or indifferent to connexion with the State. Although disestablishment and destruction of the Turkish Empire are objects which have no natural connexion political or sectarian impulses, like physical forces, often find for themselves unexpected channels. There is no difficulty in appreciating the temper of the present House of Commons; but the most sagacious observers are not yet able to judge of the feeling of the country. The Salford election seemed to throw a doubt on the existence of a Liberal reaction; but it is not yet certain whether it may not have rather indicated a general protest against attempts to tamper with Home Rule. A fortnight ago the managers of the extreme section of the Liberals organized a series of meetings in support of Mr. GLADSTONE, which were numerously attended. The success of the operation may either prove that the opponents of the Government have a majority in the boroughs, or only that the ultra-Liberal have secured to themselves the control of the party machinery. On the whole, it may be probably conjectured that a general election at the present time would reverse the decision of 1874; but the events of the war may at any time derange political calculations.

The Irish Home Rule members have apparently not exhausted their energies for the present Session. Several Irish Bills which are not destined to become law will afford ample matter for discussion; and it is reported that the Irish Secretary has undertaken to conciliate Mr. BUTT by providing time for the motions in which he takes an interest. The debate on Mr. SHAW's motion was orderly decorous, and not uninteresting. The Irish members assumed a laudable tone of moderation, and the opponents of Home Rule properly treated the question as if it was open to discussion. It would have been less easy to pretend

to proceed with any plan of federation. Mr. BURR's Irish Parliament with strictly limited functions, and the Imperial Parliament which must have parted with a portion of its sovereign authority, are universally regarded as chimerical fictions. The constituencies which return Mr. BURR and his associates only tolerate the theory of Home Rule because they suppose that it may be easier to obtain the concession of a Federal system than to throw off English supremacy altogether. Repealers, Nationalists, and Home Rulers, though they find a pleasure in quarrelling among themselves, really pursue the same policy of separation. A few days after the Home Rule debate The O'DONOGHUE took occasion to illustrate the spirit in which an Irish Parliament would probably begin its course of legislation. The proposal of converting all Irish tenancies into freeholds subject to a rent-charge would, at no long interval, be followed by the expropriation of the sinecurists who would by the previous measure have been deprived of their character of landowners. Mr. BURR indeed professes to include in his imaginary Constitution an Irish House of Lords; but an assembly of landowners unanimously devoted to the English connexion would be summarily suppressed by the representatives of the rural democracy. It would be impossible to defend the existence of an anomalous legislative body in which the majority of members would perhaps refuse to take their seats. The position of the Home Rule party in the present House of Commons can scarcely be agreeable; but it may be worth Mr. BURR's while to wait for the chances of the next election. For the first time in many years the present Government is independent of the votes of the Home Rule party. It is highly probable that hereafter fifty or sixty impartial members may once more command the price of their support.

Even if any party or section of the House were anxious to promote any legislative measure, the productive capacity of the House of Commons seldom survives the beginning of June. In the days of Reform Bills and other exciting enterprises, experienced members were in the habit of calculating that, if nothing had been done before the Whitsuntide vacation, the established system was safe for another year. The obscure details of business occupy a certain number of nights; private members take their share, with much grumbling because it is not larger; and from time to time debates on general policy, such as that on Mr. GLADSTONE'S Resolutions, occupy the time which might perhaps otherwise be devoted to legislation. There is no prospect in the present Session of contests like that of 1874 on the Public Worship Bill, or like that of the Merchant Shipping Bill at the end of the Session of 1875. The chance of surprises is diminished by the removal of Mr. DISRAELI into the Upper House, for Sir STAFFORD NORTHCOKE has no taste for startling or paradoxical proceedings. The Opposition is perhaps more liable to derangement of its plans; but Mr. GLADSTONE is too entirely absorbed by his sympathies with the Bulgarians to interfere for the moment in domestic affairs, and his loyalty to his former colleagues would indispose him to interference with their policy except for reasons which seem to him of paramount importance. There is every ground to hope that the remainder of the Session may be tranquil, and that its duration may be short. Any prolongation of the usual term would probably be the result of the disastrous necessity of appealing to Parliament for the means of taking military precautions. Mr. CROSS assured the House that there was no immediate probability of any event which could render interference desirable or necessary; but one of the contingencies which he deprecated may possibly occur in the course of the summer. If the Russian army approaches Constantinople in July or August, the Government can scarcely avoid the duty of consulting Parliament.

The almost entire suspension of legislative activity produces neither remonstrance nor discontent in the country. The return of the present majority of the House of Commons was essentially a protest against change, disturbance, and uncertainty. If the democratic movement revives in consequence of the Bulgarian massacres, it will probably be directed in the first instance to the extension of household suffrage to the counties. The next process will be a redistribution of seats for the purpose of still further depriving minorities of a share in the representation. A House of Commons constituted on the basis of a more indiscriminate suffrage would probably select the Establishment as its first object of attack. Mr. GLAD-

STONE, though he sometimes seems to think that his career as a domestic politician is over, may still live to return the courtesies of the Liberation Society. The extreme Liberal party in the House has lately been reinforced by some recruits of promise and ability. Mr. CHAMBERLAIN and Mr. COURTNEY have already secured a Parliamentary position which renders it probable that they may become future leaders. The political party is not without promising aspirants to political distinction; but the moderate Liberals, though they are still the official chiefs of the party, seem to decline in influence. If they had divided against Mr. GLADSTONE'S Resolutions, they would have been followed by a small majority of the Opposition; but it is believed that their leader would have resigned, and the present organization would probably have been broken up. The provincial clubs and managers of elections are falling more and more into the hands of the ultra-Liberal section. In many places the Dissenters employ the party machinery for their special purposes, and the descendants of the Whigs are either excluded from influence or compelled to accept the new doctrines. In the late debate the ex-Ministers, who had unanimously determined to oppose Mr. GLADSTONE'S Resolutions, vied with one another in efforts to approximate as nearly as possible to opinions which they were not prepared to accept.

INEBRIATE REFORMATORIES.

AN "inebriate reformatory" is the name of an institution to which Dr. CAMERON and some other philanthropic members propose to send habitual drunkards. They have drawn up a Bill for the purpose which has been submitted to Parliament, and which they will soon ask the House of Commons to discuss. One of the greatest merits of Parliamentary government is that it obliges philanthropists who cannot carry out their aims without new legal powers to state what they mean and propose in definite language, and to consider what is the practical machinery they desire to set up. If we hear it said that an habitual drunkard ought to be subjected for a time to restraint imposed on him by the law, it is difficult to assent to or to dissent from the proposition. We do not know exactly who are the persons with whom it is proposed to deal, or how it is proposed to deal with them. But no one can put the proposal into the shape of an Act of Parliament without examining his own intentions, being made aware of the many difficulties he will have to encounter, and striving to guard against objections. The Bill contains numerous provisions to prevent the system being abused, to make it unlikely that persons who are not habitual drunkards will be treated as if they were, to ensure that when under restraint they will not be neglected, and that the restraint will not be prolonged beyond the time for which it has been sanctioned. The general scheme of the Bill is that there shall be places to which an habitual drunkard may be sent, and that these places shall be of two kinds—retreats kept by licensed private persons, and reformatories established by the local authorities. In these places the habitual drunkard may be detained for any time not less than a month nor more than a year. They are to be, in fact, very much like private and county lunatic asylums; and, if such places are to exist at all—if, in short, an English subject is to be shut up in a sort of prison who has neither committed a crime nor lost his reason—the authors of the Bill may fairly claim to have exercised considerable ingenuity in meeting the objection that the confinement would be easily and wantonly imposed, or of a cruel character, or of indefinite duration. The main question is, whether an habitual drunkard ought to be shut up at all and have an inebriate reformatory provided for him at the cost of his neighbours, merely because he chooses to drink very much more than is good for him.

There is a preliminary point which it must have exercised the authors of the Bill a good deal to decide, and that is what is meant by an habitual drunkard. He is not a man who gets drunk habitually, for this definition would render one half of the population liable to be shut up by the other. His habitual drinking must have some odious or painful peculiarities, so that the inebriate reformatories may not be overcrowded. The definition selected by the framers of the Bill is that an habitual drunkard means a person who, by reason of habitual intemperate drinking of intoxicating liquors, is dangerous to himself or to others, or incapable of managing himself and his affairs. There is no great

difficulty about the case of a man who is dangerous to others; but it is not certain that we want an inebriate reformatory for him. He can only show that he is dangerous to others by acts constituting a danger to them. He must either hurt them or threaten to hurt them. As the law stands now, a man who, under the influence of drink, habitually hurts or threatens others, can be put in prison, or at least bound over to keep the peace, which is a step towards prison. As a general rule, if those who are hurt or threatened are any other persons than the husband or wife of the offender, the law is put in force. But, as to husbands and wives, if inebriate reformatories were established, the same difficulty in getting the law put in force would prevail as prevails now when the common goal is the place of compulsory retreat. If the husband is sent away, the wife starves; if the wife is sent away, there is no one to look after the children and the house. When we pass to habitual drunkards who are only dangerous to themselves, the difficulty about them is that, unless they take the precaution to get drunk in bed, they are always dangerous to themselves. They are always liable to be knocked down by cabs, or to fall into the fire or downstairs, or to catch cold by sleeping under a hedge, or by inducing delirium tremens. In the same way, we may ask what is meant by a man becoming incapable of managing himself and his affairs? While a man is drunk, he is of course incapable of managing himself and his affairs; and if he drinks much and often, he is sure to manage himself and his affairs very badly. The very large number of Englishmen and Englishwomen who on Monday next will celebrate one of the four new grand occasions of drunkenness invented by Sir JOHN LUBBOCK are all incapable of managing themselves and their affairs properly. But this, it will be said, is not what the Bill means. It contemplates persons who altogether neglect their affairs, and not the ordinary Englishman who even after Whitsun Monday is quite capable of doing a day's work in a drowsy sort of way towards the end of the week. But what is to be the standard? If the habitual drunkard brings himself to utter ruin, if no one will employ him or relieve him, he will come upon the parish, and the workhouse will supply the place of the inebriate reformatory. If he can get enough to live on, what is meant by his being incapable of managing himself and his affairs is that he is in a worse position than that which he might have occupied if he had had the sense to keep sober. He might have been a solicitor, and he is a solicitor's clerk; he might have been a law stationer, and he is a crossing-sweeper. In one way or another he does not make the income which his friends reasonably expected him to earn. Where is the habitual drunkard of whom thus much cannot be said?

The Bill provides that, when an habitual drunkard wishes it, he may get himself shut up in a retreat; and if Legislature chooses to interfere in the matter at all, this may be a useful enactment. Many a man on the road to ruin through drunkenness is willing, in a fit of repentance, to give himself a chance of being cured; but, after a little wholesome treatment, he finds himself so very well that he will not stay in the place of cure, and, as there is no legal power to retain him, he can walk out at any moment. But this is quite an excrescence on the Bill. Its real purport is to shut up drunkards who do not want to be shut up, but who, in the opinion of some one else, ought to be shut up. The Bill permits the parent, husband, wife, relative, or guardian of the drunkard, to form this opinion and act on it, subject to the contingency of having to pay the costs of an application if unsuccessful. A single Justice is to issue a summons to the alleged drunkard to appear, and the Justices in Petty Sessions are to order him to an inebriate reformatory if they think fit. But the drunkard is not in his extremity to lose the last proud privilege of a Briton. He may ask that a jury shall pronounce on his case, and, as it might be painful to him to have his private life ripped up in public, all proceedings before Justices and juries are to be conducted with closed doors. This is the real upshot of the Bill. It is quite impossible to say in words what habitual drunkards are to be shut up; but if any are to be shut up, it must be left to common sense to say who they are to be. The jury will have a subtle and inexplicable perception of how much a man may drink, and how often, without being liable to the reproach of being an habitual drunkard. There would be even more than the usual uncertainty as to the verdicts of the juries. In a beery

neighbourhood the jury would be very lenient, and in a teetotal neighbourhood the jury would be very severe. But it is now so customary a feature in English legislation to call on juries to decide points which the legislators and the Judges find themselves unable to determine, that this provision of the Bill, vague as it is, may be covered by precedents. The supporters of the Bill, however, must not disguise from themselves that what they ask Parliament to sanction is that any one may be shut up as an habitual drunkard whom a jury chooses to call one, and that no one except a jury can say whether a man is an habitual drunkard or not. They will also do well to prepare themselves for some perplexing questions as to the persons who are to be allowed to institute the proceedings. Parents we know, and husbands and wives and guardians we know; but who are relatives? Is it a word known to English law? Any one who, if the habitual drunkard died intestate, could take under the Statute of Distributions, supposing persons having a prior claim did not exist, is, it may be presumed, legally a relative. There is something unpleasant in the thought of a second cousin having the power to invite a jury to pronounce whether a man is or is not habitually drunk. It is true that the second cousin would have to pay the costs if he failed; but the mere accusation would inflict a social stigma on the accused which, except among the lowest classes, would always be painful, and often ruinous. It would be a case in which, if enough mud were thrown, some would be sure to stick; and there are second cousins who, if offended, would like to assist in making mud stick, even if it cost them a few pounds to gratify their spite. When the House of Commons examines the Bill it is pretty sure to be frightened by it. The aim of the promoters is excellent. Habitual drunkards are curses to themselves and to their neighbours, and if we could shut them all up and deter others from imitating their example, the world would be a better and happier place to live in. But to legislate prudently and successfully for the attainment of such an end is a very difficult task, and we fear that Dr. CAMERON and his friends will find that they are not likely to accomplish it.

THE INDEPENDENCE OF INDIAN JUDGES.

THE correspondence relating to the case of Mr. FULLER and Mr. LEEDS is, unfortunately, not entirely taken up with the offence committed by one of these gentlemen, or the sentence passed by the other. Had it been so, there would, it may be hoped, have been no need to refer to the matter again. If Parliament, or even the Secretary of State, were to become a court of appeal against every censure passed by the Government of India on its servants, the business of Indian administration would become unmanageable. But a question of great constitutional moment is also dealt with in these despatches, and this fact does undoubtedly make it impossible to dismiss them with any such summary comment. It is impossible not to feel regret that such serious issues should have been either raised or decided on, as it seems to us, so very slight an occasion. The Government of India was hasty in the first instance; the High Court of the North-West Provinces was needlessly irritable; the SECRETARY OF STATE has allowed himself to be drawn without necessity into a formal solution of a constitutional problem which he declares at the same time to be purely speculative; and at each of these stages the judgment of the authorities concerned seems to have been at fault. The cause of the mischief was an expression of regret by the GOVERNOR-GENERAL in Council that the High Court should have considered that its duties and responsibilities in the FULLER case were adequately fulfilled by the expression of the Judges' opinion that the sentence passed by Mr. LEEDS was not specially open to objection. This expression of opinion had been given in answer to a request from the LIEUTENANT-GOVERNOR of the Province. No formal motion was made for a revision of the sentence passed by Mr. LEEDS; but the local Government, finding that Mr. LEEDS's conduct had come under the notice of the Government of India, took the opinion of the Judges as to its propriety. This does not seem to justify the Government of India in making the contents of this opinion a matter of formal censure. The local Government had quoted the Judges in support of their own conclusion that no further action was necessary. There was no reason why the Government of India should take any notice of this. They were not going to adopt the opinion

of the Judges, and the most that was necessary was that they should have stated the grounds on which they had felt obliged to take a different view of Mr. LEMDS's conduct. This error of the Government of India was made the subject of an exaggerated outburst of indignation on the part of the High Court. In a letter which the Court caused to be addressed to the Government of India, the GOVERNOR-GENERAL in Council is asked first, whether the Judges of the High Court are so subject to the executive power of the Government of India that it is within the province of that Government in a published Resolution to approve or condemn the action of the Court in any matter which clearly falls within its functions; and, secondly, whether it is not beyond the competency of any authority other than the High Court to instruct the subordinate Courts touching the conduct of their judicial duties. The Court disclaims any intention of "questioning the competency of the GOVERNOR-GENERAL to notice and punish misconduct on the part of an officer of a subordinate Court"; but it submits that in the exercise of this power any declaration as to the law which should have been administered or the procedure which should have been adopted in a particular instance should be avoided.

The obvious answer to this letter is that the Government of India had not claimed to exercise any executive power over the High Court. The opinion of the Judges had been taken, not by the Government of India, but by the local Government, and the Government of India had merely stated its dissent from that opinion and its regret that it should ever have been given. There was no need to enter upon the questions raised either by the Court or by the CHIEF JUSTICE. The action of the Government of India had throughout been of an informal kind. It may be injudicious in the Executive to say that it thinks the opinion of certain individual Judges wrong, and still more injudicious to imply that the error is one into which they ought not to have fallen. But this want of judgment is not mended by the adoption of a line of defence which holds the Executive to what may have been in the first instance only a hasty expression of irritation. This, however, was the course which commended itself to the Government of India. They take matters quite as earnestly as the High Court, and though they deny that they have in any way encroached upon the authority or independence of the Judges, they are ready with an argument that they might have encroached on either or both if they had been so minded. They maintain that the Governor-General in Council is the only authority in British India invested with the entire responsibility of every department and function of Government; that of these functions the administration of justice is one of the most important; and that for this reason it is the duty of the Governor-General in Council, in the ultimate resort and in adequate cases, to censure and to punish flagrant miscarriages of justice, and to comment, when necessary, on the course of the administration of justice in India. In this case they are of opinion that there was a flagrant miscarriage of justice. As the High Court did not see its way either to call up the case or to reprove the magistrate, the Government of India were forced to reprove the magistrate themselves; and they hold that they had a right to express regret that the inaction of the High Court should have laid this duty upon them.

It is to be regretted that the Government of India should have thought themselves bound to take the opinion of the SECRETARY OF STATE upon the points raised in this correspondence. Every purpose would have been answered if they had informed Lord SALISBURY that they had not meant their censure to apply to the judicial action of the High Court; that all that they had before them was the opinions of the individual Judges on a question asked by the local Government, and that they saw no need to determine the exact limits of judicial authority and independence in India, until one or other of them had been infringed by the action of the Government. Nor is it clear why, when the Government of India omitted to take this sensible line in writing to Lord SALISBURY, Lord SALISBURY should not have taken it in writing to the Government of India. He, too, is of opinion that the question of the relations between the judicial and executive authorities is not in reality raised. In censuring Mr. LEMDS, and in expressing regret that the High Court had not brought his proceedings under judicial review, the VICEROY was dealing with purely executive functions, and these fall distinctly within

his special province. The question whether, and how far, the mode in which judicial duties is performed is a proper subject for the animadversion of the Government of India, is not raised by these papers. If the Judges had not distinctly requested his opinion on the point, Lord SALISBURY would have preferred to reserve the consideration of it till the necessity for a decision practically arose. It is unfortunate that Lord SALISBURY did not consult his own preferences, even though the Judges had distinctly requested his opinion on the point. The Secretary of State for India is not bound, like the editor of a sporting newspaper, to answer all questions that may be put to him. It is his business to determine controversies between one branch of the Indian Government and another; but in this case no such controversy had in fact arisen. There are very great disadvantages in deciding a question of this kind in the purely speculative stage. The authority to which it is submitted has no facts on which to found a judgment. If the question had come before Lord SALISBURY in the ordinary course, he would at all events have seen what practical difficulties had arisen from the solutions severally favoured by the Judges and the GOVERNOR-GENERAL. As it is, he has had to approach the subject with as little reference to facts as though he were writing an essay for a Chancellor's medal. It is by no means an easy matter to pronounce on the relative merits of independence and subjection regarded as the status of Indian Judges. The arguments which establish the necessity of making Judges independent in England cannot be applied without modification to India. Lord SALISBURY assumes that the question has been decided for him by Parliament, and that, in enacting that Indian Judges should hold office "during HER MAJESTY'S pleasure, instead of, as in England, "during good behaviour," the Legislature has withheld from the former that independence of the Executive which has been formally conferred on the latter. Certainly this is to make the distinction carry a very great weight of meaning; and, considering that a sufficient reason for the difference in the tenure of judicial offices in England and in India may be found in the fact that there is no Legislature in India at whose instance a Judge could be removed, it is by no means clear that the words relied on by Lord SALISBURY have the full sense which he attributes to them. It is improbable, however, now that the problem has been formally stated and formally resolved, that the matter can end without some further and more decisive settlement. Mr. Lewis proposes to bring the matter before the House of Commons; but a discussion on going into Committee of Supply is an eminently inappropriate mode of determining a question of this importance. It would have been better if the controversy had never been started, or had been allowed to drop; but in the stage which it has now reached it is difficult to see how it can be adequately dealt with except by direct legislation.

THE BURIALS BILL IN THE LORDS.

FUNERALS and Lord MELBOURNE are hardly congruous ideas; nevertheless, when we read the Lords' debate on the Burials Bill, we can only think of his masterly question, "Why could not he leave that alone?" By "he" we mean, almost without exception, every one who mingled in that eloquent fray of purposeless legislation. There never were so much zeal, ingenuity, piety, and statecraft brought to bear upon the perfecting of a sample of absolutely ideal failure. The results of the night's work may be scheduled as Government discredited, Opposition baffled, Archbishops disconcerted, Bishops alienated, Churchmen exasperated, Dissenters affronted, grievance aggravated, churchyards unclosed, cemeteries unmade. The wrong man proposed the wrong thing all round, and borrowed without leave his neighbours' argument. The Archbishop of CANTERBURY, in launching a scheme which he owned was opposed to the opinion of the great majority of the clergy, supported it by the cogent argument, "I don't say it is desirable in the abstract to make the concession." It is clear that Archbishop TAIR has not taken to heart the Emperor JOSEPH's sound conclusion that the trade of a King is to be a Royalist. It is no doubt the duty of an Archbishop to oppose the great majority of the order whose chief he is, if he conscientiously believes that his own view is abstractedly desirable. When he distinctly thinks the contrary, he may yield to force; but he only forfeits

the confidence of those whose leader he has become by office and not by election, without securing influence over the other side, if he rushes forward to constitute himself the mouthpiece of proposals which it is the part of his opponents to suggest and of himself to criticize. The Bishop of PETERBOROUGH had it all his own way so long as he was content to cut up the policy of his Metropolitan; but he, too, succumbed to the strong temptation of legislation, and gravely proposed to solve the difficulty, in much forgetfulness of the Public Worship Regulation Act, by letting every man do just whatever he liked. The Archbishop of York occupied an "unwilling position." Lord GRANVILLE performed the feat of speaking for Lord HARROWBY's clause without contributing the slightest additional argument to the controversy. The Duke of RICHMOND and GORDON offered the strongest opposition; and so the House got to the clauses. The Government's silent burial project had already been silently interred; and the Peers, making two bites of a not very ripe cherry, accepted without division the first half of the Archbishop of CANTERBURY's clause, providing that any clergyman might, on the invitation of the representatives of a deceased person not entitled to the service of the Church, use a form of his own made up out of that service, with portions of Scripture and hymns, provided that within seven days he reported himself to his bishop.

This rather obscure suggestion was mainly intended to meet the grievances of the unbaptized Baptists and of the Quakers, and was accepted without a division by the Government, probably with an astute perception of the usefulness in future debates of the Arcadian picture of the polite rector and the gratified executor editing the Burial Service between them in the pleasant retirement of the parsonage study. Otherwise, we have too much respect for the ARCHBISHOP's discernment to suppose that he really believed that the Nonconformist grievance would be met by a plan of which the leading characteristic was an unlimited power of veto, both as to the concession itself and as to its details, on the part of the parson. The second half of the ARCHBISHOP's clause, relating to "cases where the Burial Service might lawfully be used"—i.e. that portion of mankind who are not unbaptized Baptists or Quakers—was the logical complement of the half already adopted, and would have obviously been as inoperative within its wider as the former part was within its narrower range. However, the Lords by a small majority decided that they had sacrificed sufficiently to plausibility, and rejected it. The Archbishop of York's proposal to protect the clergyman who might find himself conscientiously compelled to refuse the Burial Service to an unworthy object found no support, and was rejected without a division. This conclusion is not to be regretted, as the clause went on to authorize the representatives of the deceased evil-liver to insult the conscientious incumbent by turning some other clergyman loose into the churchyard to read over the body—probably in total ignorance of all the details of the case—that service which the parish priest, to whom they were familiar, knew would be a blasphemous mockery. We shall only ask the ARCHBISHOP one question—has he ever looked into the archives of such Societies as the Mendicity or the Charity Organization Society? If he has, would he like to set up again, in connexion with funerals, that sort of clergyman who battered upon weddings before the passing of Lord HARROWBY's Act?

All these archiepiscopal suggestions were the prelude to the grand performance of Lord HARROWBY's clause, or, in other words, of our old friend Mr. OSBORNE MORGAN's Bill. One hundred and two peers accepted, and the same number rejected it; and so, by the forms of the Upper House, it was lost; and with it, of course, the Bill goes. We shall not repeat the objections which we have frequently urged against this most unpractical suggestion. Nor shall we attempt to prophesy the future course of the agitation. It is one in which right and wrong have very little place. The Dissenters, when they abolished compulsory Church-rates, ruled themselves out of the churchyards, and now they want to resume the privileges which they then refused to pay for. They have been asked to co-operate in a general system of cemeteries which, at a very small cost all round, and perhaps at some sacrifice of feeling, under which Churchmen would be equal sufferers, would abundantly supply every material want; and they repudiate the

offer. They are short-sighted in their policy. As long as Church-rates were compulsory, they had an ostensible grievance. When they abolished the compulsion, and yet claimed the churchyard, they transferred the invaluable heritage of grievance to their opponents. If the Liberation Society brings its greedy tactics to a prosperous issue, and forcibly steps into possessions in the maintenance of which it has refused to bear its part, it will, we believe, find in the Church of England, thoroughly united under a material wrong, a far more difficult customer than it has had yet to reckon with. In the long run it may come to think that it has dearly bought the privilege of preaching at the parson on his own freehold by the adjournment *sine die* of disestablishment.

SOME ASPECTS OF CHARITY.

REVENGE has been called a sort of wild justice, and the same name might be given to many forms of charity. The wildness, of course, would not lie in that ferocity of meddlesomeness which is sometimes shown by people who vex the poor with their visits, but in a vague and random mode of setting social differences to rights. Among the many impulses to active beneficence a subdued sense of the wrong that is in the world is one of the strongest. In different degrees almost everybody with any heart feels, or has felt, that he has more than the share he deserves of the world's good things, while his neighbours have often less than, in an ideal society, all men and women would possess. This sense of injustice, of *πλεονεξία*, to use the untranslatable Greek word, may become so strong as to prevent people from enjoying their own part and lot in existence. George Eliot has drawn a character of this sort in Dorothea, and, to judge by her autobiography, George Sand was a sufferer from the same form of mental malady. Dorothea could not even take her pleasure quietly in works of art, because so many of her fellow-creatures were incapable, through the strain of bad fortune and the want of education, of the same enjoyment. A great deal of charity—most of it perhaps, in the beginning—springs from this gnawing sense of restlessness, this want of acquiescence in the disparity of conditions, and from the consequent effort to put life straight.

It is clear that different people will feel this inequality of human fates in different relations of life, and in very different degrees. No one is supposed to be exempt from this *malaise* at Christmas, when the opulent purchasers of turkeys and of the material for mince-pies are expected to right the wrongs of those who have no mince-pies and no turkeys. The want which others feel of food and shelter and clothing, of which we ourselves have abundance, is the most obvious and striking shape of social disparity, the aspect of the wrong in the world which lies nearest to sense. But it is not the most delicate, far-reaching, and sympathetic charity which is stirred to the practices of Christmas. Unless we put our own joy in punch and the wassail bowl and so on, we are not much more moved in mid-winter than at any other time to right the wrongs of the penceless, and so to enjoy old English merriment with a clear conscience. An immense gulf separates the people who cannot overeat themselves with perfect comfort unless they have helped their poor neighbours to something indigestible, from persons like Dorothea, who cannot enjoy the sculptures in the Vatican while the crossing-sweeper in the next street is still ignorant of the proportions of a volute. The difference runs all through the practices of charity, beginning with the British merchant whose sense of justice is satisfied when he has signed his usual benevolent cheques, and ending with the men and women who spend themselves and are spent in the effort to raise and enlighten, to feed and save, the bodies, souls, intellect, and even taste, of the crowds to whom fortune has not been kind.

Some of the great historical instances of charity have no doubt been produced by that desire to see justice done which becomes almost a fever and an insatiable passion. As no one can really "play at Providence," like the Prince in one of Eugène Sue's stories—no one at least who has heart and insight—the only satisfaction has been found in reaching a level of poverty in which the ascetic cannot feel as if, by his own better fortune, he wronged any mortal. It was thus that poverty became the bride of St. Francis, and the ideal of hundreds who were touched with his malady. Persons of this way of thinking are like the generals who voluntarily submit to all the privations of the private soldier. Their ardour for equality is so great that they cannot be at ease while they have any worldly advantage over the poorest. No one can "level up," and by his own effort alone raise all mankind to a happy height of well-being. No one can hope, in his own days, to see many fruits of his labours towards this end. The enthusiastic and impatient have therefore found out a swifter and shorter way to the introduction of equality, and have felt it easy to descend to the level of the outcast. It is natural that leaders of men of this character, like generals who drink of the rain water, eat the common biscuit of the soldiers, and march on foot, should have many and loyal followers. But, in the end, this proves to be the wrong way to go to work, and this impatience works no real deliverance. It is only the ease of the conscience of the individual that is obtained by his sacrifices. Perhaps for him there can be, or rather for him there can

tainly is, no greater gain. Yet his charity, to a greater extent than he suspects, has ended at home. The slow movement of the world is quickened, to be sure, and the world's life enriched, by the spectacle of insatiable hunger after almost any ideal. It is so much easier to gain a facile satisfaction out of some little gifts, and slight, scarce-felt self-denials; it is so much easier to grow dull to all large sympathies, and to be absorbed in desires which are not spiritual, that even the pursuit of a false end is better than dull acquiescence in things as they are. Except for the stimulus given by the example even of mistaken energy, humanity does not gain much from the self-inflicted sufferings of the enthusiast who has levelled himself with all the wretched, instead of raising a few of the wretched to equality with his own estate, bodily and mental. The enthusiastic conscience is satisfied, and a cynic, looking at the result, as it affects other people, of even some saintly lives, might parody the Frenchman's *mot*, and say, "Il n'y a qu'un misérable de plus." The remark would be as one-sided as are most cynical aphorisms; but it is true nevertheless that the most devoted charity has been more self-regarding, more meant to minister to an almost morbid passion for justice, than the seekers after holy poverty were aware.

It is because most people feel the inequalities of existence in different ways that charity takes the innumerable and often fantastic forms in which this virtue nowadays goes masquerading. The advertisement sheets of the newspapers are a sort of carnival of queer virtues and of benevolence in odd attire. At Christmas, and in winter generally, we know of course that the unequal distribution of coals and creature comforts will become apparent to the most obtuse, and that some spasmodic efforts will be made to right the wrong. Christmas passes, and "it will go hard," as a large school of writers put it, if we don't have an oppressed nationality somewhere, or a threatening of battle in Europe. This is the moment when the sense of wrong is most widely felt, in an unconscious sort of way, by what is styled the great heart of the British people. The great heart is always in gymnastic training, and a patriotic writer has lately asserted that, if England would only go to war, and if the Prince of Wales would only lead her armies, "the heart of the British people would throb with one huge beat of joy." This is a prophecy merely; but it is certain that the secular exemption of this island from the dangers and distresses of war within its coasts has made the public very sensitive to the misfortunes of less lucky countries. Hence that quaint, unprecedented form of charity which raises subscriptions for the sick and wounded soldiers of nations which are far from loving us. People feel that it is rather a shame that Alsatian, or Servian, or Turkish fields should be wasted by fire and sword, while nothing more perilous than a steam threshing-machine infests the farms at home. They try to throw a little weight into one scale of the world's balance, to adjust the wrong in a feeble way, by giving money right and left to peasants, ambulances, Bulgarians, Bashi Bazarouks—in short, to almost any cause or country which is not too proud to take a cheque. What the public would have felt if, in the Crimean War, the Austrians, a neutral people, had sent handfuls of coal and rice to the starving British forces, it is impossible to guess. No idea was probably more remote from the Austrian mind. But, as long as we are lookers-on, and have a feeling that we are too fortunate, and that some little sacrifice must be made to Nemesis, the absurd system of "tipping" belligerents may be expected to go on. Ideally, in looking at some subscription lists of to-day, one feels as if the British public took the undignified attitude of spectators at a prize fight who choose their side and toss their odd coppers to their favourites in the ring. Something may be said for a charity that does not take sides, but merely brings surgical aid within reach of both combatants in a war. Impartial mercy of this sort rather makes for showing the ludicrous and illogical side of warfare among civilized nations. But when charity is partial, and backs its man with lint and poalices and new boots, then it is the virtue and the people who display it in this silly shape that are made ridiculous.

A perverted sense of justice is probably at the bottom of the charity which is copiously showered on the families of interesting murderers. Murderers are the belligerents of private life, and the sympathy which does not go to military nations bent on blowing up the monitors and magazines of their neighbours is kept for amateurs who do a little butchery in a quiet way at home. Last year one or two respectable men, in France and England, so far yielded to circumstances as to cut the throats of their partners, mistresses, children, and other near connexions. Their surviving relations were consoled by so many gifts that a poor and struggling man might be tempted to commit murder instead of insuring his own life. The returns are quicker, the villainy less, the risk of course considerable; but every investment has its drawbacks. Probably this sort of charity is based on a sentimental theory that the murderer has not been quite justly treated. Society, no doubt, is to blame. Perhaps the poor man had a great-grandfather who drank, or an aunt who was "queer," if not "cracked." Very likely the absurd prejudices of the world drove him to commit murder in order to hide some minor sin on which the world frowns. In any case, the freedom of the will is a knotty question, and gentlemen or ladies who have entered these metaphysical toils can clear their consciences by sending a post-office order to the good clergyman who receives subscriptions for the family of the interesting and misguided murderer. In the meantime, if any virtuous person has died in the performance of his duty and as a consequence of his self-sacrifice, by all means let the memory of his virtue be

the sole reward of his bereaved ones. A great scholar, a modest and original worker, who, self-taught, unlocked the keys of dead languages and unravelled the mysteries of unknown alphabets, lately fell a victim to his devoted enthusiasm for knowledge. Spent with travel, labour, and the toil of dealing with a jealous and barbarous people, he left in a distant land his work unfinished, and his widow and family to the gratitude, not the sentimental charity, of England. We wish we had reason to believe that, while thousands of pounds are collected for unlucky aliens, more than one thousand had been subscribed for the widow and children of the scholar to whom we refer. The descendants of another writer, whose name is known to every English man and woman who can read, and whose works have been the delight of four generations, were also till the other day in utter destitution, but were thought less deserving than the families of assassins and the armies of unfriendly Powers. But happily in this instance the neglect has been corrected by the Queen's generous grant of pensions to the three sisters Defoe. All this freakishness in charity springs from the fact that charity is too often a mere form of self-indulgence. First, a morbid interest is excited by some highly-coloured tale of sin or wrong, and then comes the need to relieve the feeling of undue superiority and unjust good fortune. When once the attention of people is caught by a wrong, they are ready enough to see that it is more by luck than desert that they are saved while others are disgraced or ruined. The charitable gift that follows is partly an effort to right the wrong, still more an attempt to soothe the conscience; not least, it is a little gift to Nemesis, like that sacrifice of a ring which has so often been quoted. A little more discrimination and a little more gratitude would improve the character of that second-rate charity which is mainly impulsive.

MODERN ARCHERY.

THE archery of modern times is in every way different from that which prevailed when the long-bow was the favourite national weapon of our ancestors and when our bowmen were the dread of Europe. Those were the days when the sheriffs had to see that the people duly exercised themselves in archery during their spare hours, and when a man had to stand in the pillory on Cornhill for selling bad bowstrings. It is no longer practised by the yeoman class which during the fourteenth and fifteenth centuries was a distinguishing feature of this country, and supplied the archers that fought at Cressy, Poitiers, and Agincourt. No longer as archers, yet equally as soldiers, these yeomen do the fighting for the community. Strength of pull is not now, as then, the *signum non* of success in the battle-field. It is left to amateurs to maintain, not as a calling, but as a recreation, the reputation of English archery, and the responsibility is not lightened by encouragement from a sympathizing public. The bow, from being the favourite weapon in war and peace, has yielded in popularity to the rifle and the cricket-bat. It is altogether ignored in the public schools, and, when taken up by men, is often only a last resort. Archery has somehow lost ground. Once it was the ruling passion of Englishmen from prince to peasant, and country gentlemen carried their bows, as they now carry their guns, in search of deer and pheasant. But in these times neither prince nor peasant knows the sight of a bow. London itself is hardly conscious that the headquarters of archery in England are in its very midst; and little do the ladies who enjoy their weekly music in the Botanic Gardens guess that on the other side of the high road there is going on a gentle rivalry with the long-bow in place of the more popular rivalry in dress.

The impression produced on the mind of an outsider who sees an archery meeting for the first time will vary according to his tastes and susceptibilities, but in any case the spectacle is likely to amuse. A foreigner would probably be not less astonished at the sight of a party of ladies shooting three arrows under a broiling sun, and then walking sixty or seventy yards to pick them up and repeat the process, than was that Eastern potentate who, when he first saw a cricket-match, inquired why the players did not have slaves to fetch the ball, instead of hitting after it themselves in such mad fashion. To an ordinary spectator who knows nothing of the nerve, skill, or details of archery, the sight must at least be novel and picturesque. We do not refer to the competitions held in London through the summer months, where men in green share their honours among themselves; we have in view certain country meetings where the green coats and caps are subdued and tempered by the many-coloured tutus of the lady archers. All is eagerness and animation, and, if the sky be blue and the flowers in bloom, who will say the sight is not worth seeing? Our forefathers, with all their shooting, could not produce a picture like this. But let us, as one of the uninitiated, look more closely at it, and mingle with the actors. The first thing that strikes us is the marvellous variety of style and attitude indulged in by the shooters, both male and female, all having in view, be it remembered, the same object. One begins his or her "drawing-up" by pointing at the sky over head, and another at the ground in front; others despatch their arrows with a toss-up of the bow-hand, with a horizontal wabbling of the bow, with an onward motion of the body as if to follow the arrow, or with a general jerk of both arms, which leaves the right hand aloft. The arrow is variously drawn to the chin, the ear, the breast, or even lower. The positions are often awkward.

and uncomfortable, but no two are alike. We wonder which of them all is the right thing, and in our perplexity appeal to the judge, who has been measuring golds and is standing near. He directs our attention to a man who is shooting quietly and comfortably, with nothing noticeable about him except the extreme ease with which he shoots and his apparent possession of reserve force; his arrows fly low and sharp; his position is natural, erect, and well set, and his figure remains motionless, yet not rigid, as the arrow quits the bow and leaves his right hand just below the chin. "And yet," adds the judge after a pause, "though he shoots so well, he never looks at the target when shooting, but at some point to the side of it. Many people have no aiming-point at all; but that is a thing every one has to find for himself by long practice before he can attain to any excellence in shooting." We feel that these things are beyond our ken. From remarks we overhear we gather that every one is shooting badly and grumbling accordingly. Many of the men abuse their tackle, and are more or less put out; the ladies are less concerned, but find fault with the weather or the arrangements generally. One man is shooting with a strange bow, and doesn't like it, or it has lost its "cast"; and another has a blister on his finger, caused by an ill-fitting tip, whilst a third has got restive because his companions talk aloud when he is shooting. The ladies' complainings are more those of injured feelings, arising we fancy sometimes from nervousness, and sometimes from force of habit. One is put out because she has been made captain of her target and has to score; another has been placed at an "outside target" where the proximity of the spectators disconcerts her; another has to shoot last at her target and is nervous; another, and one of the best shots, disapproves of percentage deductions from her score, and wants to have back the obsolete ring-deductions. The competitors are evidently on good terms with one another, and the sexes are not separated as they are at the great public competitions. Altogether the fête is stirring and attractive, giving the idea that, in spite of individual disappointments, there is plenty of healthy excitement and honest pleasure for the actors themselves, whilst lookers-on will see quite as much to interest as at a cricket-match or pigeon-laughter.

Middle-aged men and men of literary bent follow archery with much zest and appreciation. Violent exercise is with them out of the question, either from physical inability, waning energy, or from not harmonizing with the other surroundings of life. Health requires exercise as well as air, and archery offers it in the most acceptable form. More than three centuries ago Roger Ascham tried hard to counteract the ill effects of over-study by daily exercise at the butts, and Thomas Waring, the father of modern archery, completely cured himself of chest disease by the same remedy. If the would-be archer has already been an athlete, he will find in a modified form all the rivalry and excitement of his earlier experiences, and he may still combine health and pleasure in an easy and profitable manner. Young men fresh from the public school or university playgrounds are not met with in the archery-field, unless the more blood-quickenings amusements are inaccessible. They look upon archery as a pastime fit for ladies and weakly youths, or for themselves later on when they are good for nothing else. Cricket, boating, lawn-tennis, with their conditions of more robust health and muscular development, enable those who practise them to realize a stronger sense of actual enjoyment than the more sober and deliberate archery. Much as the latter is to be valued, our opinion of a youngster who adopted it when he could get cricket would not be heightened. In London, except to the few, archery is as impracticable as the more vigorous sports, and a man's exercise has too often to be found in the billiard-room. Where archery flourishes, ladies are always in the majority; but they do not take it up for the same reasons as men, and very seldom on the plea of health. Their motives are generally no stronger than the love of a little novelty in their daily life. They do not love archery for itself, but for its accessories; variety, excitement, showing off their figures, as in Gwendoline's case, conversation, tea-drinking, perhaps flirtation, go to make up their ideal of an afternoon's amusement, and one or all of these belong to an archery meeting. This is proved by the reaction that sets in when the meeting is over; bows and arrows are put aside for other attractions, until the prospects of the next monthly gathering begin to be discussed. Practice is neglected, or done by fits and starts, and as a drudgery. It is too hot to shoot, but, strange fact, not to play lawn-tennis and dance through the summer night. There are, on the other hand, those who have fought their way into the foremost rank and are anxious to hold their own, and there are also those who are struggling and striving for a success that is long in coming. But the great mass of lady archers is composed of an intermediate class, with no ambition in their heart and no heart in their work. They have acquired a moderate position with which they are content. They manage to win prizes occasionally for the "best gold" or "most blues"; but these are rather due to good luck than to good shooting. Their method continues to be full of faults, but they are indifferent to that, preferring a style that is unsatisfactory or eccentric to the trouble of changing it. One lady finds it indispensable that the string should touch her nose before the arrow is released, and another cannot loose it until the thumb be pressed against a favourite spot on her face or neck. Some who would shoot cannot for want of instruction at the outset. The present championess practised persistently for seven years; but, having no one at hand to correct and advise her, made

little or no progress and rarely hit the target. No doubt the steadiness, perseverance, and determination that carried her through that long period of ill success and disappointment have since served her well in many a hard-fought fight. Other ladies, again, take to archery naturally and at first sight. Their arms may have been seasoned by riding or driving, and the bow, light as a feather in their hands, calls for little effort; whilst the difficulties of stringing the bow and adjusting the arrow which beset most beginners cause them no anxiety. If a friend is at hand to correct the natural errors into which all archers fall at starting, their way is easy, and success is pretty sure to follow.

The more the subject of modern archery is examined, the more difficult it will be to find points of resemblance between it and the archery of Robin Hood's day. The bows and arrows have an elasticity of draw and a beauty of finish which our forefathers never dreamed of even in the days when labour was cheap and archery universal; they were probably more like those still used by savage tribes in Africa, but longer and stronger, fashioned for work, not play, for the realities of war, not the sportive rivalries of peace. Experienced archers no longer pull their arrow to the ear, but to some point below the right or aiming eye, thereby keeping the arrow, like the rifle, in a true line beneath the eye; in olden times there could have been no more aim than the rough-and-ready one of a boy who throws a stone at a mark, partly because it was desirable to shoot as quickly as possible, and partly because in shooting at distances beyond 120 yards it is impossible to get a point of aim actually on the object to be hit. It is to Horace Ford, the first man who scored a thousand in public on the National Round, that we are indebted for exploding the old theory that the proper mode of aiming was to draw to the ear. Every one knows that the sole advantage obtained by the latter style was that it allowed a longer pull; but when hard hitting ceased to be the one great end of shooting, the time came to solve the problem of aiming on some truer principle than that of drawing the arrow past the eye and on to the ear. Now that the road to good shooting has been made so smooth and straight by others, the work of the modern toxophilite is comparatively easy; with health, patience, and perseverance, and a plentiful command of temper, he ought to ensure for himself a career of enjoyment and success.

THE DISCOVERIES AT MYCENÆ.

THOUGH it is now some months since Dr. Schliemann's discoveries at Mycenæ took place, and though the interest which they have excited has been very general, the European public has as yet only very vague and imperfect notions as to their real value and significance, and amidst the enthusiastic applause which has greeted the discoverer in this country, we still hear a strange expression of doubt and distrust. Many still go about asking, Are these Mycænæan antiquities really so very old? while some few still insinuate that they have no connexion with the heroic age at all—in short, that they are either Byzantine or modern. This doubt and distrust, however unmerited, has been partly caused by the unscientific and inadequate manner in which these discoveries have been made known to the archaeological world by Dr. Schliemann. During the period of his operations he wrote several letters to the *Times* stating generally the nature of his discoveries; but no regular report of them, accompanied by photographs and plans, has, so far as we know, been as yet submitted to any learned Society, and the few persons who have been able to see these Mycænæan antiquities at Athens have seen them under conditions which made accurate description no easy task. Moreover, as no drawings of them have as yet been permitted, it has been very difficult to compare them with what we already possess in museums of kindred character; and the want of such methodical study and comparison has led more than one distinguished archaeologist to pronounce hasty and ill-considered opinions as to the value of the discoveries. It may therefore be of use to note what accounts of the Mycænæ antiquities, giving the result of careful examination, not only of the objects themselves, but of the site of their discovery, have already appeared in print. Here Germany, as usual, was first in the field. In the fourth number of the *Mittheilungen* of the German Institute at Athens, published this year, is an excellent article by Mr. A. Milchhöfer on the excavations at Mycenæ. Very shortly after this appeared in the *Academy* of April 21 and 28 two articles by Mr. Percy Gardner, and in the *Times* of April 20 was a long letter on the same subject from a correspondent fresh from Mycenæ. When we compare the descriptions of these three writers, who are all evidently archaeological experts, we perceive that, though there are certain differences in their mode of viewing the Mycænæ antiquities, they agree in the main in their verdict, of which we offer the following summary:—

1. These antiquities appear to be of a very remote epoch, certainly before the first Olympiad; how much earlier has yet to be ascertained. We have reason to believe that evidence will be adduced which will carry their date back beyond the time of Homer.
2. The art, throughout, is very rude, much ruder than we might have been led to suppose from the glowing descriptions written by Dr. Schliemann in the *Times*, in the first outburst of joy at his great discovery.
3. There are traces of Asiatic influence in this Mycænæan art,

though this influence is slighter and more difficult to trace than in the subsequent stages of archaic Greek art.

4. The great bulk of the objects found are probably of local origin, though some few are evidently imported. There are, for instance, two specimens of Egyptian porcelain and several vases in fine white alabaster, which may have been brought from Sidon through that Phœnician traffic of which such sure evidence is found both in Homer and Herodotus.

5. With a few exceptions, the works in metal, whether gold cups and ornaments or bronze caldrons or weapons, appear to have been executed without the aid of casting or soldering, by means of that primitive process which the Greeks called *aphyrelaton*, and by which plates of metal were beat out (*repoussé*) on a mould, and then united one to another by nails. We know that the most archaic bronze statues among the Greeks were made in this manner, and that casting statuary on a large scale did not come into use till a later period.

6. The metallurgists of Mycenæ were very imperfectly acquainted with the art of chasing and engraving reliefs. What was afterwards known to the Greeks as *toreutic* work was then quite in its infancy. Such attempts at chasing as we find are mere *graffiti*, and the intaglios of the gold rings and stones found by Dr. Schliemann are equally rude.

7. As generally in early art, the attempts to represent figures in the round are very inferior to the reliefs; the ornaments, whether floral or geometrical, are far more correctly and vigorously designed than the representations of animal life, the lions and other animals better understood than the human figure.

8. In the higher subjects represented there is a marked preference for the two principal occupations of the heroic age, war and the chase; but among the miscellaneous mass of ornaments occur here and there mythological figures and symbols, and also strange naturalistic emblems. Thus we find among the small personal ornaments, the sphinxes, hippocamps, and gryphons of later Greek art; a naked female figure with doves, who can hardly be any other than the Aphrodite whose worship the Phœnicians brought with them to the coasts of Hellas; a temple singularly like that on the later Greek coins of Cyprus; on one of the rings three female figures appear to be bringing offerings to a goddess seated in front of a tree from which an attendant behind her is gathering fruit. In contrast to these subjects, we find among the personal ornaments the constantly recurring types of a butterfly with spread wings, executed in low relief, with singular delicacy and fine observation of nature; another winged insect, probably meant for a bee; a sort of grub, perhaps the chrysalis of a butterfly; and a cuttlefish with long feelers. It is not probable that these natural objects were chosen as ornaments at haphazard. Like the scarabæus which the Etruscans borrowed from the Egyptians; like the golden *cigales* which, as we know from Thucydides, the Athenians once wore on their heads in token that they had sprung from the Attic soil; like the bees which appear on the coins of Ephesus and on the statues of the Ephesian Artemis, these Mycænæan butterflies, cuttlefish, &c., probably had a special significance in connexion with the contemporary religion; and it may be that in the myth of Psyche, as it appears in later Greek art, we have only a revival of a symbol already adopted in the earliest dawn of Hellenic civilization.

9. So far as the vast and miscellaneous mass of objects from the Mycenæan tombs has been examined, no trace of writing, whether Phœnician or Greek, has been detected. Of course we except the single fragment of pottery, with an archaic Greek inscription, found in the upper soil, which from the form of the letters evidently must be attributed to a much later period than the objects found in the tombs themselves and in the lower strata which covered them.

10. Very little glass was found in the tombs, and what there was consisted chiefly of beads, such as might have been imported from Egypt or Sidon. The variegated glass bottles which occur in such abundance in the tombs of Camirus at Rhodes, and which are associated with remains of the archaic period in that later stage which we call for convenience the Greco-Phœnician, were altogether wanting.

11. On comparing the Mycænæan antiquities with the incidental notices of art and metallurgy which we find scattered through the *Iliad* and *Odyssey*, many interesting resemblances and coincidences both of subject and treatment suggest themselves. In this respect the difference between the Mycænæan antiquities and those from Hissarlik is very marked. In spite of much ingenious argument which has been employed to establish relations between art as described by Homer and the barbarous products of the *Troia* found at Hissarlik by Dr. Schliemann, we are of opinion that no real affinity exists between the two, and that the art described by Homer is based on recollections of what the poet actually saw in the royal treasuries, and perhaps the temples, of a more civilized time. Nay, we would go one step further, and assert that Homer must, before he composed his description of the shield of Achilles, have seen much finer works in metal than Dr. Schliemann has disinterred at Mycenæ. The art of the Homeric age we believe to have been more like the wonderful treasure of gold objects recently discovered at Palestrina, and those gorgeous objects from the Regolini Galassi tomb at Vulci, which form the principal attraction in the Etruscan Museum at the Vatican.

Much remains to be done before we can appreciate the full value of Dr. Schliemann's marvellous discovery at Mycenæ. The pottery, of which he collected many fragments from his diggings both on

the Acropolis and in the Treasuries, will have to be studied in its relations to the earliest pottery of Rhodes, Santorin, Melos, Athens, Cyprus, and Etruria; and it must be further compared with the fragments of pottery from the tumuli near Sardis, from Assyria, from Palestine, and from Phœnicia, which have been already gathered into museums. Nor must we forget, as part of the same inquiry, the further exploration of that most curious site near Smyrna which Tenier describes in his *Asie Minor* as the Tantalais, and which is believed to have a close connexion with that Pelopid dynasty which, according to legend, was afterwards transplanted to Mycenæ. The work of further exploration in Greece and Turkey, and of study and comparison of the Mycænæan antiquities with what we already have, and what we may some day acquire, will occupy much time, and can only be accomplished by a number of young, well-trained archaeologists such as Germany and France are constantly sending out to the East on special mission. The students of both those countries have the great advantage of a home, a library, and an organization for scientific purposes, at Athens; and the researches of the Athenian *Ecole Française* and of the newly-established German Institute there are contributing greatly to the progress of archaeology in Europe. May we not venture to ask whether it would not be possible to devote some small endowment to the equipment of students to follow in the track of Chandler, Leake, Gell, Cockerell, and other explorers of a bygone generation, whose persevering labours are better appreciated abroad than they are here? We have indeed, as a nation, had our share in laying the foundations of classical archaeology, and may be said to have contributed more than one corner-stone; but how much of this work is due to the aid of either Oxford or Cambridge? Where are the travelling Fellows who might at this very time be at work, as the French are, at Delos, or as the Germans at Olympia? Where are the professors of archaeology to train such students, and the museums which in Germany are to be found in every University as an essential part of academic teaching?

MR. GLADSTONE AND THE LIBERAL PARTY.

THE present time must be one of grave discomfort to the Liberal party. Patent as it is to all the world that there is hardly a single question on which more than two of its recognized leaders think alike, yet there seem to be deeper depths of despair which it may look forward to reaching in the future. To men who believe that the masses require leaders, and that it is essential that those leaders should possess strength of purpose and the courage of opinions formed outside the haze and clamour of popular excitement, the situation is miserable. When every fanatic finds an ex-Cabinet Minister ready to pat him on the back and to speak kindly of his crotchets, men of sense may well wish for a complete set of new pieces on the political board. To do justice to the Conservatives, whether the fact be due to the virtue of organizations or of individuals, there has been much less deference paid by them to the hectoring of cliques and the bullying of associations. There are no views now too absurd to be without support, or without the means of thrusting themselves before the public and obtaining a pledge from a political candidate. If five fools hold that the moon is habitable, and can be advantageously colonized, owing to the value of the volcanic deposits, and that the Government should be pressed to supply the means, the five fools have a career before them. A room is hired, a secretary obtained, an association formed, and, after a refusal on the part of the Government to provide the necessary funds, a letter is written to Mr. Gladstone to know what line he will take with regard to the matter at the ensuing elections. By return of post the five fools get their answer. Mr. Gladstone regrets the action of the Government. He always considered the question of the colonization of the moon an open one, and remembers crying in connexion with it in childhood. He would suggest to the Association the duty of ascertaining the fierceness of the dog in the moon, which might impede their progress. He will, however, fully detail his views in the *Contemporary*; meantime he heartily concurs with the memorialists, and trusts that the next election will enable him to support them actively. Then the letter is published in the local papers—a sorrowful spectacle for those who have no wish to see genius stultified. It is sad that Mr. Gladstone did not live before the invention of printing, when eccentricity was necessarily confined within narrower limits. We can fancy the injured fairy who was not invited to his christening exclaiming, "You shall spend half your time in writing letters which all your friends shall rue. A worse fortune still shall attend you, and conspire towards your ruin. In your lifetime the postal system shall be fully established, and all the wild ideas that teem from your brain shall be sent and read by everybody for a single halfpenny." What additional woe might not Achilles have caused had he been in the habit of writing upon all subjects on post-cards, instead of putting Thersites's circulars in the fire! Most men are aghast at the aberrations of Mr. Gladstone's public conduct. From a political point of view what is to be said about a man who dallies with spiritualism, and considers the expediency of vaccination an open question? If he were a second Petruccio gesticulating on the high road to a second Katherine, the world would be amused at the domestic scene, and would

treat his paradoxes with indifference; but when they appear to be seriously uttered, and calculated to mislead the ignorant and the rash, it is time that every influence should be set at work to nullify them. What can be the position of a party when, each day that it takes up a newspaper, it fears to see the enunciation of some wild piece of folly upon the part of its ex-leader? Conservatives are sometimes credited with the desire to unpick the legislative woe of their predecessors; but what might not Mr. Gladstone abrogate in a moment of conscientious vacillation? What evidence would suffice for him? what laws would avail? what could science do to stop his hand?

Shall I weep if a Poland fall, shall I shriek if a Hungary fail?
Or an infant civilization be ruled with rod and with knout?
I have not made the world, and He that made it will guide.

Mr. Gladstone certainly did not make the world, but he is evidently determined to guide it. The prominent position he has lately taken is not in the least due to the wishes of any one but himself. It is in no obedience to the cries of a nation that he has interrupted the course of politics, and endangered the existence of even a nominal party. Because at the present moment the moderate Liberals are not in strong antagonism towards the Government, it does not follow that they do not adequately fulfil the functions of an Opposition. There may be times when the interests of the country at large are of greater importance than a mere party success. Any very strong feeling in the constituencies on the subject of foreign politics might excuse, if not justify, special interference. Nothing, however, during the last six months has shown the existence of such a feeling. The southern division of Shropshire, on the death of one of its members, fell uncontested into the hands of a respectable Conservative squire, though in 1865 the division had returned one Liberal, and in 1868 had been closely fought. Of the more recent lesson learnt from Salford it is needless to speak. There never was a time when it was more necessary than it is at present to hide the many differences of opinion which exist among the heterogeneous elements out of which what is called the Liberal party is composed. There is hardly a question on which moderate Liberals differ from either Sir Stafford Northcote or Lord Carnarvon. The disestablishment of the Church, the extension of the franchise, interference with the rights of landlords, are looked upon by the great majority of Mr. Gladstone's former colleagues with disfavour. They have not attacked the foreign policy of the Government, and they disapproved of Mr. Gladstone's autumn manoeuvres. There is scarcely any measure desired by them which the Conservatives would not be delighted to pass, and probably in their anxiety to originate they would make more concessions to the spirit of reform than would content their opponents. Fortunately for the Liberals they have the Burials Bill as a *cheval de bataille*; but no one can say at what moment their hopes of raising the country upon this grievance might be taken away from them. The formation of County Boards is the last step that might have been anticipated from a Conservative Ministry, and if legislation proceeds after this fashion, an appeal *ad misericordiam* will be fittest for Liberals, who will not be able to suggest in their addresses any more valid reason for their success than that it is their turn. We should like to see the address of some old Whig issued just now. What would he promise? Were he to record his convictions in sober truth they would run much after this fashion:—"I have really nothing to say against the Conservatives except that they are in office, cannot let things alone, and are in too great a hurry to accept the suggestions of irresponsible persons. As for the Church, it suits me very well as it is, so I shall only say that the question is one which is not ripe for consideration. I should deprecate extremely any change in the land laws in England, where the despotism of the owner is usually exercised to the great advantage of his tenant, and shall leave that topic out altogether. As to the devolution of real estate in cases of intestacy, I don't mind an alteration, as it will have no practical effect. Lord Derby has vacillated in his management of the Foreign Office, but, thank goodness, Mr. Gladstone has had nothing to do with it during the past year. I do not see any social benefit to be gained by the extension of the county franchise; but my ancestors have fought the county for a century and burdened the estate with a sad number of mortgages, and I suppose I must go with the party. Indeed, my family has always held pronounced views, and if Mr. Gladstone would confine his operations to Ireland, there is no progress I am not capable of supporting and no experiment I should object to seeing tested. If the liquor trade were diminished, the country would be immeasurably happier. I have put down nearly all the public-houses on my estate, and proportionately reduced my rents. My agent, however, tells me that in consequence I shall not have a vote in the neighbourhood, and recommends me not to mention the subject. Decidedly I must confine myself to general expressions of interest in the country." The condition of mind represented by these opinions is not a restless one, and Mr. Gladstone is not the exponent of it. If anything could teach the Liberal party a lesson, recent experience might make them wiser. It may be feared, however, that the discord is now too great to enable any order to be kept, and that every question, as it comes uppermost, will disclose fresh divergences of opinion.

THE STEAM TRAMWAYS DELUSION.

WE recently gave a summary of the Report of the Committee on the use of mechanical power on tramways, and this has now been followed by the evidence on which the Report is based, and by a Bill introduced in hot haste by the President of the Board of Trade to carry out the recommendations of the Committee, and allow free scope for all sorts of wild and, as is admitted on official authority, at present dangerous experiments. The chief point in the Committee's Report was the cry of humanity. The managers of horse tramways have given evidence of the shocking way in which they kill off their horses by disgraceful overwork; and the only remedy the Committee can think of is that "common humanity loudly demands some other motive-power than that of horses." We cannot answer for common humanity; but common sense would probably say that the natural and proper way of punishing such conduct would be to prosecute the persons who are responsible for it under the Cruelty to Animals Acts. The Committee state that, "without pledging themselves as to what regulations or what legislative measures may be required at a future and perhaps at an early date," they "are of opinion that the use of mechanical power on tramways should generally be permitted, and recommend that any Provisional Order or Private Bill granting the necessary powers should contain clauses" laying down certain conditions as necessary for public security. The Board of Trade, adopting this view, has taken the responsibility, evidently without adequate reflection, "to authorize the experimental use of mechanical power on tramways," by a Bill the chief clause of which provides that "the Board of Trade may, by a licence containing such restrictions, conditions, and regulations as they may think fit, authorize for a limited period not exceeding one year, and as an experiment only, the use of any specified mechanical power, either in addition to, or in substitution for, animal power, for moving carriages on any tramway in Great Britain; and any such mechanical power may be used accordingly." It is therefore highly important that the exact nature of this singular proposal should be examined and the evidence in favour of it duly weighed.

The first witness was Mr. Farrer, the Permanent Secretary of the Board of Trade, who gave an explanation of the present state of the law as to tramways as far as he was acquainted with it. When tramways were first introduced in this country the sanction of Parliament had to be obtained by means of a private Bill; but in 1870 power was conferred on the Board of Trade for facilitating the making of tramways by means of Provisional Orders issued by that department, while the option was left to the promoters to proceed by private legislation. From the passing of this Act down to the 30th of June last, tramways have been authorized in 44 places, two and a quarter millions of money spent on them, and about 161 miles of lines opened. Altogether 317 miles have been authorized, including those in existence before the new law was passed. A year or two back there was a good deal of opposition to the extension of tramways in the metropolitan district, and the whole of the Bills and Orders were suspended for the Session, the result being that since then tramways have not been allowed in the centre or West-end of London; but, with that exception, they have gone on very much as proposed. On the whole, the Act has, in Mr. Farrer's opinion, worked well; but he mentions certain tramways "which," he thinks, "afford a subject of special interest." One of these is the Wantage Tramway, for which, with horse-power, a Provisional Order was granted in 1874. In 1876 an application was made for leave to use steam or other mechanical power in addition to horse-power, and there was no opposition. The Board of Trade sent down Major-General Hutchinson to inspect the line, and he reported that he did "not see that the tramway would become other than a railway, and thus a source of danger to the public using the highway, as well to those using the tramway, considering the unlocked facing-points which occur at the turn-outs." It was thought, however, that those defects might be amended, and eventually the Board made an Order. The Order, as first sent to the Board, contained a provision repealing the Locomotive Act as regards this Tramway; but the Board, with a modesty which would perhaps have hardly been expected from that department, "thought," as Mr. Farrer puts it, "that it scarcely rested with them, by Provisional Order, to repeal a general Act of Parliament." They were, however, advised that they could, under the Tramways Act, make a Special Order authorizing steam upon this tramway, without infringing the provisions of the Locomotive Act; which would seem to be much the same thing as repealing the Act for the special benefit of the applicants. Mr. Farrer, however, is candid enough to confess that he thinks "this opinion is open to question," and that it would be well in any new legislation to define the powers of the department, which, as the rest of the evidence confirms, is certainly necessary, for the officials of the Board of Trade seem to be setting themselves up in an insidious way as a second Legislature. In the present year there are eight Bills asking for the use of steam-power, and eight applications for Provisional Orders to the same effect. Mr. Farrer on this point expressed a belief that, "if the steam traction upon tramways succeeds, we shall very soon have applications for the use of steam upon roads without rails." He also remarks that "of course the subject is a new one, and the experience of the Board of Trade is very small in the matter"—this is painfully evident throughout the evidence—"and it is very probable that other things may turn out to be necessary." Indeed, Mr. Farrer even goes so far as to predict that

"it is a very likely thing that Railway Companies will promote these tramways themselves, with a view to making them feeders to their lines."

Mr. Farrer confined himself to the law, and did not profess to have any practical acquaintance with the mechanical aspects of the subject. These it was left for Major-General Hutchinson, one of the Railway Inspectors, to expound. He described various experimental steam and other tramways which he had seen. In one at Govan, on the Clyde, the motive-power was compressed air, and there was no noise, smoke, steam, or any fire visible; the speed was from eight to ten miles an hour. The chief objection to this system is that the receiver under the car can only be stored with an amount of air which would be apt to get exhausted in the middle of the journey, and then the machine would stick fast. As to the Grantham steam-car, the experiment reported on was up to a certain point successful, but something got wrong, and it had to be stopped; and it was observed that at both ends of the car there were handles for shutting off and applying steam, which were "much in the way of people getting in and out of the car." The boiler was vertical, and carried in the centre of the car, with steam cylinders underneath; and there was "nothing particularly objectionable" with regard to steam, smoke, and noise; but it was admitted that, as the passengers sat round the inclosure in which the boiler was, and over the cylinders, they would be exposed to serious danger if an explosion took place; though, as the Inspector remarked, this danger would be only slightly less if the engine were apart from the car. Then there was Merryweather's traction-engine, in which the passengers are separate from the machinery, but hauling power is to a certain extent lost, though this may be partially overcome by the application of special means on heavy inclines. Hughes's tram-car has also two divisions, and at the time of the experiment witnessed by the Inspector seemed to be satisfactory as to smoke and steam. But when he was asked "how far modern inventions approached the rules laid down for the safety and convenience of the public?" his reply was that none actually did so, but that "there were engines now in course of construction which would comply with the requirements proposed by the Board of Trade." This of course remains to be seen, no perfect example having yet been exhibited, so far as this witness knows. He also paid a visit to Paris last June to study the tramways there, but the rules as to their management had not then been completed, and they were not open for public traffic; but in an experimental way they worked, he thought, pretty well, though they were apparently not up to the Board of Trade ideal. As to horses being frightened, he observed in Paris that cavalry troop-horses, as a rule, took no notice of the engine, but the non-commissioned officers' horses were more restive, and the officers' horses most of all; so that "it seemed that, as the mettle of the horse improved, so its dislike to the steam-car increased"; and he did not think this would ever wear off in such animals. He did not attribute the terror of horses at a steam-car to either the smell or the sight of fire, but to the unusual style of locomotion, so that, under all circumstances, so far as his experience went, strange horses were more or less restive at meeting such vehicles. "Every horse that had a kick in him would give a kick." It seems that some wisacre has suggested that something in the shape of a horse should be placed in front of the car; but, like most of the "all-important features" of this grand *pseudo*-post-future scheme, it does not seem to have been satisfactorily worked out. The Inspector also points out the dangers to which tram-cars as at present constructed are exposed. "The all-important point" is that the control of speed, whatever the motive-power, should, after it reached a certain velocity, be out of the control of the driver and automatically checked by some self-acting arrangement which, it seems, has yet to be invented. Thus every steam and mechanical car should be able to stop itself, even if the driver were asleep, when running downhill or exceeding the proper speed; and should also have a speed indicator attached to it by which the driver might know how fast he was going, and which should serve as a record of speed; but these also are apparently not yet provided in a practicable form, though they exist in the sanguine imagination of many inventors, and even of this Inspector. It should also be noted that the cases in which he saw these so-called successful experiments were either roads which were very wide, like the new broad boulevards of Paris, or where there was "no large amount of traffic in the streets." He also acknowledges that the use of steam carriages upon roads where there are a good many horse carriages passing would be, he would not say "absolutely dangerous," but would "require great care upon the part both of the tram-drivers and coach-men," which is a very mild way of putting it; and that, under any circumstances, tramways spoiled carriages by wrenching the wheels, and "in introducing steam into crowded thoroughfares you ran the risk of frightening horses, and the more crowded the thoroughfare the more danger there is."

The bulk of the evidence taken by the Committee was almost exclusively given by persons commercially interested in the invention, manufacture, or management of tramways—including one inventor who seems to take almost all the elements of nature under his kindly patronage, and has "got out several schemes for working with steam, compressed air, gas, and ammonia," and another, who, though not unfavourable to the use of mechanical power, has a decided opinion that it is premature, as he had a superior invention for working horse-cars. It is needless perhaps to say that, with the exception of the last, all these gentlemen are thoroughly convinced that the problem of mechanical working in one way or another

has been triumphantly solved, and that the country ought to be at once handed over to their tender mercies. But when we examine this evidence it is rather weak in some points. Thus Mr. Hopkins admits that, if a system of steam-power which shall satisfy all the reasonable requirements of the Legislature is "not actually already invented at this moment," it "is so nearly accomplished that you may consider it accomplished." It is not a new experience to hear of an inventor who, having all but found the philosopher's stone, or how to make gold or diamonds of cinders, believes that "it is so nearly accomplished that you may consider it accomplished." This witness on being asked whether in his inquiries as to steam-cars he had not omitted the material point as to cost of working, said that he did inquire on that point, but did not obtain any information. He also confessed, in answer to a question whether he would, as an engineer, recommend the Companies for whom he was engineer to adopt a scheme as to the financial results of which he was perfectly ignorant, he replied, "Certainly not"; yet practically he gives his support to such speculations. Then he is asked:—"Is there any engine complying with these requirements running at this moment, so that one might go and see it?" and his answer is, "I think not." This witness of course holds that his own engine is a complete success in fulfilling the essential conditions of a steam-car; but as to the indicator and recorder, on which General Hutchinson insists so strongly, these are "not yet accomplished." One or two non-official and independent witnesses were also examined, such as Mr. A. F. Stanley, M.P., who, among other things, gave evidence as to the "very injurious effect upon the roads of traction-engines," and Mr. Gregory, M.P., spoke to the great inconvenience and even danger which were caused to other passengers by the existing steam tramways in Kent, and said he had known cases of people having to turn their carriages into fields till the locomotives went by.

We have gone rather into detail in regard to these minutes of evidence, because they are documents which are little read, most people being content with the Committee's vague Report; and also because it is of great importance that the value and point of the evidence should be clearly understood on account of the empty and delusive talk on the subject which is kept up by persons who think that they are all going to make large fortunes by turning the roads and streets of the country into railways. What, then, does the evidence come to? Mr. Farrer does not pretend to know anything about the subject in its mechanical aspects; and General Hutchinson has only made a very slight and superficial investigation, has never seen anything not purely experimental, and, in fact, knows so little that he cannot say whether the use of traction-engines for drawing carts on the common roads is excessively destructive to highways; and, when asked to explain some wonderful apparatus which he praised, said he should "not like to undertake to describe it, as he probably should not make himself intelligible." On the other hand, the general evidence, even of the promoters of the movement, shows that the contrivances which are relied upon as securities for public safety are still in a crude and visionary stage, and that the liberty which the Government Bill would allow would subject the community to a very alarming and perilous course of experiments. There is one part of the evidence which deserves notice as an answer to the plea that the law is to be worked at the discretion of the Board of Trade. There are few departments in which so little discretion has been shown as in the present administration of this office, in regard to ships and everything else; and Mr. Wyatt, a Parliamentary Agent, shows how unfit they are to be trusted with legislative functions. It is indeed well known that there is not that searching inquiry into the compliance with the Parliamentary Standing Orders in the case of a Board of Trade Provisional Order which there is in the case of a Private Bill, nor is the inquiry made by equally competent persons. Moreover, in the former case it is a mere hole and corner affair, and the promoters of a scheme have ample opportunity of concealing important facts. On the whole, then, this hasty attempt to give legislative sanction to wild and fantastic experiments on a subject of such immense interest to the community, in the bare hope that some day they may come all right, is a very hazardous and unjustifiable proceeding, especially at a time when the existing tramways and road-engines are doing a great deal of mischief, and when the natural increase of population is leading to grave difficulties in regard to wear and tear of roads, and the movement of traffic in crowded thoroughfares.

THE CHAPTER OF ST. KATHARINE'S HOSPITAL.

THE Queen has been graciously pleased to reply, through Sir Thomas Biddulph, to a memorial on the subject of St. Katharine's Hospital, signed by about two hundred clergymen and churchwardens of parishes in the East-end of London. After reciting the prayer of the memorialists to which we referred in a former article, Sir Thomas Biddulph conveys to Mr. Lowder, of St. Peter's Vicarage, London Dock, the message of Her Majesty "that, as the memorialists are aware, a Commission was appointed in 1869 to inquire into and submit to the Queen a scheme for the regulation of the institution. Following the precedents established in 1698 and 1829, the Queen has now called on the Lord Chancellor to frame rules for the future administration of the Hospital."

It is easy, whenever exactly the right thing has been said or done

in a very direct and simple manner, to be wise after the event, and to say that no other course could possibly have been taken under the circumstances. But in this case, fortunately, the wrong thing had been done or said in considerable variety and in much roundaboutness of manner, before a happy inspiration led the East-end residents to ask the Queen herself to listen to their representations. In very few words, the Royal Patroness of St. Katharine's Hospital has assured the memorialists both of her knowledge of the laws of the foundation and of her intention to act upon them. It was necessary perhaps, at least it was kindly and courteous, that the Queen should refer to the Royal Commission appointed in 1869, and to the "scheme for the regulation of the institution" which that Commission "was appointed to submit." To the scheme which that Commission did actually submit the kindness of Her Majesty makes no reference at all. "*Cetera desunt*," as the editors of old MSS. say. Between the first and second sentences of the Royal reply an interval of several years is supposed to elapse. But it is within our province as critics to notice that the Royal Commissioners who reported in 1871 "suggested, firstly, that a private Act of Parliament be obtained to give effect to several parts of this our Report"; whereas "the Queen," having evidently taken more pains to look into the history and law of the matter than Her Commissioners thought worth their trouble, and "following the precedents" thus established, "has now called on the Lord Chancellor to frame rules for the future administration of the Hospital." The view of the Royal Commissioners was founded by the modern horizon of the "private Act of Parliament." The Queen, with wider insight into and care for an historic past, recognizes the charters of Queen Eleanor, of Henry VI., and of Elizabeth, "*reservantes nobis, et Reginis Angliæ nobis succedentibus, plenam et liberam potestatem . . . mutandi articulos quoscunque in presenti churcā contentos, ad meliorationem hospitalis predicti, secundum quod nobis et Reginis Angliæ nobis succedentibus prævia ratione videbitur expedire.*" This provision of Eleanor's charter Her Majesty, following later precedent, interprets by the clauses in the subsequent charters which exempt the foundation "from all jurisdiction, secular and ecclesiastical, other than that of our Chancellor of England or Keeper of the Great Seal of England for the time being, or of the Master or Warden of the said Hospital," &c. It would have been possible for Her Majesty to trace the history of precedent to much earlier days. Yet perhaps the somewhat high-handed dealing of Queen Eleanor with the previous foundation of Queen Matilda would hardly serve as an example to follow. "*Finis coronat opus*" is justification sufficient for the age of Henry III. The Crown and the Bishops had a severe contest in hand against the Pope and the Austin Friars, and if Eleanor had been guided by strict modern rules of law, there would probably have been no Hospital of St. Katharine now existing for the Lord Chancellor's regulation, as the foundation would have disappeared in the dissolution of the great Priory of Aldgate, from whose "custody," as we learn from the lamentations of the Priory chroniclers, it was wrested more or less legally by the Queen.

Of the "precedent" established in 1829 there is not much to say; but it is only fair to the Chapter of half a century since to acknowledge that its Master and members did their utmost to resist, and if possible to prevent, their uprooting from the East-end of London. They petitioned to be left in peace in their ancient home; they illuminated, with such lights as were possible in 1824, when for the time they were left in peace; but the "private Act of Parliament" of 1825 was too strong for them, and they were turned out to seek lodgings where they might find them, as in the Regent's Park in 1829 they did. But the precedent of 1698 is of much higher importance and much greater present interest. The unpublished records of the Chapter of St. Katharine's contain a very graphic picture of the details of Lord Somers's Visitation, which gives life to the dry narration of his "ordinances" as recorded by Ducarel in his appendix, p. 121, and copied by the Charity Commissioners of 1866; and which, it may be hoped, may be published in full when the present Lord Chancellor has submitted his report and "ordinances" to the Queen. The result of this visitation of Lord Somers was a very sweeping reform in the management of the foundation. The Master, Sir James Butler, was removed for non-appearance and for various other offences, including "the using of the common seal for corruptly disposing of the place of a Brother and Sister"; from which it is evident that up to that date the nomination of the Brothers and Sisters had not reverted to the Royal Patroness, although the clerical qualification of the Brothers had been restored after the appointment of a new Master in 1681. Lord Somers also suspended Dr. Lake, one of the Brothers, for six months for non-residence and non-performance of the duties of his office; and he laid down strict and minute regulations for the maintenance of divine service, the residence of the clerical members of the Chapter, and the general management of the Hospital and its revenues.

It is, however, at this point that there first appears a distinction between the position of the Brothers and that of the Sisters in this venerable Chapter, which is preserved to the present time, and which is without any authority whatever in the ancient history of the foundation. At the time of Lord Somers's Visitation in 1698 the stipend of the Brothers was for each 8*l.* annually. This is exactly the amount of the stipend of each Sister in the return of the expenses of the Hospital made to Queen Elizabeth. There is no evidence, of course, as to the payment of the Brothers previously to the Dissolution in 1545, because a common table was kept in the Hall for the members

of the College who lived with the Master, while the Sisters had their separate provision, as in the ordinances of Queen Philippa. But the will of John de Hermesthorp, who was Master of the Hospital when it was visited by the Lord Chancellor in the reign of Richard II. (1380), and who died in 1412, shows an exact equality in the position of the Brothers and Sisters respectively. He bequeaths to each Brother and Sister alike 13*s.* 4*d.*, while to the three "*secularibus capellanis*," or Chantry Priests of the church of St. Katharine, he leaves 6*s.* 8*d.* each, and to each of the ten Beadswomen 3*s.* 4*d.* In like manner, in his bequests for the day of his funeral, he leaves to each Brother and Sister of the Hospital 3*s.* 4*d.*, while "*cuilibet capellano*," "*cuilibet mulieri pauperularum et cuilibet clericorum chori*," he gives 1*s.* 8*d.*, thus exhibiting the social and ecclesiastical equality of the Brothers and Sisters, and their superiority to the other male and female members of the foundation. When Wilson was compelled to reinstate the three Brothers to complete the Chapter according to the charter, as there is sufficient evidence to show that he did, the equal position of the Brothers and Sisters was retained, the Brothers being clearly laymen; and the will of Sir Julius Caesar, Master of the Hospital, who died in 1639, witnesses to this equality. In this will, dated 27th February, 1635-6, he bequeaths "to the three Brethren and the three Sisters of the Hospital of Saint Catherine neare the Tower of London, to each of them three pounds in ready money," and "to each of the ten Beadswomen or Almeswomen of that Hospital forty shillings sterling." During five centuries and a half, therefore, from the first foundation of this Hospital, the Brothers and Sisters of the Chapter were held in equal honour, and were of the same rank; and this as much in the days which succeeded the dissolution of religious houses as in the ages when female members of ecclesiastical communities were familiar to English experience. Not till Lord Somers's Visitation in 1698 was any distinction made between the emoluments of the Brothers and Sisters of this Chapter. By his ordinances the stipends of the Brothers were first to be increased from 8*l.* to 40*l.*, and afterwards those of the Sisters to 20*l.* each, although still the position of the Sisters in Chapter was to be equal with that of the Brothers, and the portion of the fines on renewal of leases which was assigned to the Chapter, exclusive of the Master, was to be divided between the Brothers and Sisters—"share and share alike, for the more comfortable subsistence and better encouragement in performing their respective duties." By Lord Lyndhurst's orders, in 1829, the disproportion between the emoluments of the Brothers and Sisters was to some extent reduced, as the stipends of the former were raised to 300*l.*, while those of the latter were fixed at 200*l.*; but at the same time certain compensations for the loss of clerical fees in the late collegiate church increased the incomes of the Brothers, while those of the Sisters remained still at the singularly poor and inadequate amount, even with the addition of a house of residence for each, at which Lord Lyndhurst's orders fixed them. The share of fines, or the sum due as compensation for loss of fines while the leases are being left to run out, must of course be added in the case of Brothers and Sisters equally. We have in former articles on this subject expressed our earnest hope that in any scheme for the future administration of St. Katharine's Hospital the position of the Ladies of the Chapter may be maintained in, or rather advanced to, the full honour and dignity which belongs to it, and from which Lord Somers, we fear, is responsible for in some measure displacing it. The British Protestant public, no doubt, is unaccustomed to the idea of ladies holding any ecclesiastical position or rank. But here most happily is an undoubted instance of such a position, whatever the ignorance of the British Protestant public hitherto may have been. This ignorance, it may be hoped, will in due time be dispelled and enlightened; and meanwhile, as the Royal patronage in regard to this portion of the Chapter cannot be exercised more wisely than it has been, the only point which we would venture to submit to the consideration of the Lord Chancellor is that the Ladies of the Chapter ought to be restored, in their proportion of emolument from the foundation, to their original equality with the Brothers.

The Brothers of St. Katharine's are by law already—if the mysterious labyrinth of legislation constructed by Church Building and Church Reforming Acts of Parliament admits of being threaded by any definite system of interpretation at all—Canons, and are entitled to be so described. On this point the Chapters Act (3 & 4 Vict. c. 113) is clear in its opening section. "All the members of Chapter except the Dean, in every cathedral and collegiate church in England, shall be styled Canons." That St. Katharine's is a collegiate church is undisputed; but it is worth while to show that the fact is not merely indisputable in theory, but admitted in practice, in order to place in a stronger light the mistake, to which we have previously adverted, of representing this foundation as a charity. Neither Lord Somers nor Lord Lyndhurst knew anything of any Pluralities Act. That piece of legislation was imagined, on its first appearance, to be very dangerous to the dignity of the Church of England. It has in experience proved of great advantage in promoting the Church's welfare and efficiency, chiefly by abolishing the abuses and mischiefs of non-residence. But it was essential that provision should be made under this Act of 1838 (1 & 2 Vict. c. 106) for the temporary non-residence of beneficed clergymen in certain specified cases; and among these is exempted, by section 39, "any spiritual person being prebendary, canon . . . or minor canon in any cathedral or collegiate church" when he is "required to reside and perform the duties of such

office by the charter or statutes of such cathedral or collegiate church." The three Brothers of St. Katharine's Hospital are all beneficed clergymen, and have all been admitted to their benefices, or to their membership in Chapter, or to both, since the passing of the Pluralities Act, and thus come under its provisions. Each Brother is required under the statutes of St. Katharine's "to reside and perform the duties of his office" for four months in every year; while three months' absence is the extreme limit allowed under the Pluralities Act to a non-exempted incumbent. The case of the Brothers or Canons of St. Katharine's is obviously not covered by any of the long list of exemptions contained in the previous or 38th section of the Act; and it is therefore clear that it is as canons of a collegiate church that these three gentlemen receive, and rightly receive, their dispensation or exemption as to the full term of residence required by the Act in ordinary cases from the Archbishop of York and the Bishops of Peterborough and Winchester respectively. It is of course by mere ignorance or inadvertence that local newspapers in the East of London or elsewhere have been in the habit of describing these clergymen and the ladies of the Chapter as recipients of a "charity"; but there is no excuse for such ignorance and inadvertence in official quarters; and we trust that the Lord Chancellor will effectually put a stop to the use, in public documents, of a phraseology which can only be exonerated on the ground of absolute ignorance from the charge of something very like intentional discourtesy.

Very mistaken reports are current as to the available income of St. Katharine's Hospital. It does not now exceed 7,000*l.* annually, even when the rental of the Master's Lodge in the Regent's Park is taken into the account. The residences assigned to the remaining six members of the Chapter are but reasonable additions to their moderate, and in the case of the Sisters their inadequate, incomes. An increase of about 8,000*l.* in yearly revenue will gradually accrue by the falling in of leases within the next thirty years; but only a small portion of this increase can be expected within ten years from the present time. Earlier possession at a smaller rate of increased rental may perhaps be secured by arrangement with some of the lessees; and as such an arrangement was suggested to the Royal Commissioners upon experienced advice, the estimate of a prospective income of 12,000*l.* a year, which we have given in a former article, may be taken as approximately correct. There is abundant provision in the funded capital of the Hospital to make compensation to vested interests for the loss of fines while the leases are running out; and the proportion of the estates and income which should be assigned respectively to the directly ecclesiastical or capitular, and to the eleemosynary or educational, divisions of the original foundation, is a subject which will no doubt fall under the Lord Chancellor's consideration in drawing up the code of regulations which the Queen has now called on him to frame.

BREAKING THE SABBATH.

THE old question of the due limits of Sunday observance has turned up again in a new form. An association composed of clergymen and laymen, which has been established for the purpose of securing the opening, not of theatres, but of public gardens, picture galleries, and museums on Sunday, has already held several meetings. It includes representatives of such widely different types of thought as Professor Tyndall, Mr. T. Hughes, Dean Stanley, and Mr. Stanton of St. Albans. The natural presumption would be that a scheme which combines the suffrages of so heterogeneous a body of supporters must have something to say for itself. We have lately been told on high authority that the opinion of the West-end is generally wrong; but at all events those who can see no impropriety in turning "the Zoo" into a Sunday afternoon lounge cannot with consistency object to throwing open the British Museum on the same sacred day. An *à fortiori* argument might indeed be plausibly urged on the latter point. For, if the fashionable loungers were excluded from Regent's Park, many equally innocuous methods of recreation would remain open to them; but "our poorer brethren in the middle aisle"—as a late popular preacher used to designate his humble auditors—too often find their only resource in the alehouse or the gin-palace. We commend this consideration in passing to those zealous apostles of temperance who are agitating to procure a Sunday closing law. The *Record* however, as might have been expected, is not a little scandalized at the movement, nor is its pious horror diminished by the ominous union of High Churchmen and Broad Churchmen in so unholily a crusade. And here the *Record* undoubtedly expresses the sentiment of that portion of the religious world which especially glories in the name of Protestant. A "moderate" Bishop is described somewhere—if our memory serves us, in one of Mr. Disraeli's earlier novels—as "too High Church to keep Sunday and too Low Church to keep Friday," and the description is not infelicitous. If Friday fasting has always been regarded as a distinctive mark of Papists and Popishly-minded persons, the strict observance of "the Sabbath" is considered no less characteristic of sound Protestants. Yet it seems strange at first sight that those who inveigh so fiercely against the superstitious observance of "days, and months, and times, and years"—in which catalogue St. Paul unquestionably included the superstitious observance of the Sabbath—should cling with such rigid pertinacity themselves to the keeping of a certain day which after all is not the Sabbath. We will

not undertake to say whether the usage in question is or is not "a fond thing vainly invented"; but an invention it certainly is, and an invention of very late date. If those who maintain the observance of fasts and festivals are fairly charged, as they often are charged, with "teaching for doctrines the commandments of men," they can at least plead in their defence a tradition of eighteen centuries. But the Sabbatarian tradition is little more than two centuries old. It derives as little countenance from the fathers of "the Blessed Reformation," English or foreign, as from the fathers of the primitive Church. The Confession of Augsburg expressly condemns it; Cranmer, in accordance with his general Erastianism, calls the observance "a mere appointment of the magistrate"; even the Puritanical Calvin used to play at bowls on Sunday at Geneva. And to this day the countrymen and coreligionists of Luther and Calvin have nothing in common in this respect with their English or Scotch followers. The "Continental Sunday" which Protestants are so fond of denouncing is really characteristic of Protestant more than of Catholic countries; so much so indeed that the measure of influence exercised by the Church may usually be gauged in a foreign city by noting what proportion of the shops are kept open. Thus at Munich and Lucerne they are closed, in Paris only very partially so; at Berlin and Zürich they are open. The Sabbatarian view is an invention, not of the sixteenth century but the seventeenth, when the Puritans so fiercely railed at "the impious *Book of Sports*" issued by authority of Charles I. and Laud, and contrived under Charles II. to secure the passing of what Lord Shaftesbury has designated "the most remarkable and one of the most valuable Acts on the Statute-book." Baxter displayed his wonted moderation in saying—what is perfectly true—that "from and in the Apostles' days the Churches everywhere agreed in the holy use of it [Sunday] as a separated day." But a very brief retrospect will suffice to show that their agreement was far from covering the modern Protestant estimate of the day.

In the New Testament there is no injunction on the subject, and the Sabbath is never spoken of there, any more than by ecclesiastical writers, except as a purely Jewish ordinance. But it may be gathered from scattered intimations, especially with the light reflected on them from later tradition, that the first day of the week, which is called in one passage "the Lord's day," had already begun to be observed in memory of the Resurrection by the celebration of the Eucharist. The Sabbath, or Saturday, was indeed also kept holy in many Churches by fasting and religious services, not at all in connexion with the defunct Jewish law, but in memory of the Burial of our Lord, just as Wednesday and Friday were kept in honour of the Betrayal and the Passion. When, after the conversion of Constantine, Christian institutions first received the recognition of the State, an edict was issued enjoining the cessation of all judicial business, military exercises, and ordinary labour on "the venerable day of the Sun," excepting only agricultural work on account of the uncertainties of the weather. This was confirmed in the year 386 by an enactment of Theodosius, which also prohibited public spectacles on Sunday. Similar regulations had been made by the Council of Laodicea some years earlier, enjoining Christians to abstain from worldly business on Sunday and to attend the Mass. But as regards theatrical entertainments, it must be remembered that these had all along been forbidden to Christians, not on one day of the week, but on all days, on account of their idolatrous and licentious character. When, after the lapse of several centuries, sacred dramas began to be introduced into Christian practice, they were usually performed in churches and on Sundays or festivals. For mediæval usage, while sternly enforcing the abstinence from "servile work"—and that no doubt partly, and very rightly, in the interests of the serfs and labouring classes—always favoured Sunday amusements. The day was treated as the weekly festival of the people, combining recreation with religious worship, which last was itself a kind of recreation and helped to add something of brightness to their dull and monotonous lives. Charlemagne renewed in his Capitularies the civil enactments of the Roman Emperors about the observance of Sunday, and many later Councils confirmed or supplemented the canons of Laodicea on the subject. The same end was promoted by the wide circulation and belief of stories of miraculous penalties of disease or death which had befallen those who profaned the day, many of which may be read in St. Gregory of Tours' work *De Miraculis*. Of course St. Gregory did not talk about "Sabbath-breakers," but these legends remind one strongly of the popular tales of modern Evangelical tract-writers about the awful judgments—miraculous in all but the name—which came upon Tom the poacher or Jim the burglar, who began by playing truant from the Sabbath school and rapidly advanced with the fatality of a judicial process from his boyish neglect of the Fourth Commandment to the gallows.

It is curious sometimes to watch not only how "extremes meet," according to the proverb, but how extremes interchange with one another. The name and notion of the Sabbath, as applied to the Christian Sunday, was a brand-new invention of the seventeenth-century Puritans, and is cherished to this hour as the badge of the strictest sect of Protestant orthodoxy. But the Puritan sticklers for Sabbatarianism would perhaps be surprised, and hardly gratified, to learn that Catholic France was ringing not many years ago with denunciations of sabbath-breaking. Bishop after Bishop issued pastorals to reprove this sin; the Abbé Millon, then chaplain to the Emperor, published an impassioned tract, quite in the style of Mr. Ryle, with the unimpeachably Protestant title of *Sanctifier le Sabbat*; and sabbath-breaking was one of the crying national sins which evoked the anathema and inspired the solemn warn-

ings of our Lady of La Salette. Certainly, if the Puritan tradition does not prove that sabbatarianism is right, neither does its being enforced by ultramontane prelates and miraculous apparitions of the Madonna prove that it is wrong. But the very narrow and rickety basis on which that tradition rests should convince reasonable Christians of whatever Church that, while the observance of Sunday is abundantly justified both on religious and moral, not to add utilitarian, grounds, and its discontinuance would be nothing short of a national disaster, the particular limits and methods of that observance must be controlled by broad considerations of public utility, in the highest sense of the term, which may vary more or less with changes of time and circumstance, and can neither be fixed nor elucidated by reference to the Law of Moses. The rigidity of the Scotch Sabbath has been materially relaxed during the last few years, and it is well worth considering whether some relaxation might not be advisable, even from an exclusively religious point of view, in the lighter but somewhat elastic code of external discipline hitherto prevalent in England.

SCURVY IN THE ARCTIC EXPEDITION.

THE strange delay which has taken place in the publication of the Report of the Medical Committee appointed by the Admiralty to inquire into the causes of scurvy in the recent Arctic Expedition has, as the questions asked on Thursday in the House of Commons showed, excited some surprise and even suspicion, but of course it could not be kept a secret for ever. The Committee was appointed on the 9th of January, and sent in its Report on the 3rd of March; but the document has only just been issued. The inquiry was divided into three parts—the cause of the outbreak; the adequacy of the provision made by the Admiralty in the way of food and medicine; and the propriety of the orders for provisioning the sledge parties. The Committee attribute the early outbreak of scurvy in the spring sledging parties to the absence of lime-juice from the sledge dietaries; and enumerate among the subsidiary causes the long, dark winter, confinement in a lower deck in a vitiated atmosphere not free from damp, extreme changes of temperature, and comparative deprivation of fresh meat, especially on the *Alert*, which were aggravated by severe cold and arduous labour. They also find that the provision made in the way of food, medicine, and medical comforts was in every respect adequate for the performance of the special service of the expedition, and more complete than that of any other expedition which has preceded on Arctic service; that the orders of the commander of the expedition for provisioning the three extended and principal spring parties did not include lime-juice, thereby deviating from the Tenth Article of the Memorandum of Recommendations and Suggestions of the Medical Director-General furnished by their Lordships for his information; and that, the reasons assigned for such deviation being insufficient, the said orders were not proper. The Report contains a paper by Dr. Donnet and Dr. Fraser on the medical treatment of scurvy, giving the prevailing view of the profession on the subject, and recording some of the more salient points of the outbreak of the scurvy, especially in regard to its causation. From this it appears that morbid effusions into the cellular tissues of the body are the peculiar characteristics of scurvy, and represent the deterioration of the blood which is the result of a depraved nutrition, and the evidence is all but unanimous that the want of fresh vegetable food or of some of the constituents which compose such fresh vegetable, and probably also fresh animal, food is the cause of scurvy. It is then pointed out that, though scurvy is essentially a disease of mal-nutrition, there are various conditions which powerfully contribute to its early appearance, and aid in its development, such as those which interfere with nutrition and lower the standard of health. The more prominent of these are illness from intermittent fever, cholera, dysentery, or deprivation of sunlight; deficient meat food and fatigue; and many of these were at work during the sledge journeys.

An account is then given of the incidents of the voyage. The *Alert* and *Discovery* sailed from Portsmouth on the 29th of May, 1875; after "an unprecedented passage," they entered the "north water" on the 25th of July, and about the end of August they settled down in their respective stations in winter quarters. There were at first preparations for watering and preliminary sledging to supply exercise; but on the disappearance of the sun (the 12th of October in the case of the *Alert*, and the 16th in that of the other ship) the sledge work ceased, and the crews entered upon the long Arctic winter, which lasted till the beginning of March. Though there was little exercise in the open air, and confinement on board ship for nearly the whole day, there were amusements and interesting employment of various kinds. During this winter, and for some time previously, the men were fed on a liberal diet, in which the vegetable element was fairly represented, and daily rations of one ounce of lime-juice were served out, while variety was occasionally afforded by fresh meat. When the sun again appeared, there were preparations for the spring sledging; but the diet on board ship continued to be represented by the winter scale, with the exception of a double allowance of lime-juice on board the *Alert*. On the whole, the crews seem to have been during this period in very fair health, considering the conditions of their life, among which were the "bad atmosphere of the lower deck, where the men slept, and spent a large proportion of the twenty-four hours; superabundance of carbonic acid, and an insufficient renewal of the

air in the lower decks, which led to an accumulation of vapour from exhaled breath and the steam of food, so that the atmosphere was generally damp; and there were further extreme changes of temperature. As to fresh meat, it appears that the crew of the *Alert* suffered from the scarcity of game in higher latitudes, for they were restricted to an issue on only fourteen days, while the men of the *Discovery* had a sufficient supply of large game to give them fresh meat on fifty-three days. It is admitted that this was calculated to operate prejudicially on the health of the former crew, and may therefore have favoured the development of scurvy in common with other forms of disease; but the evidence given to the Committee is "pointedly opposed to the opinion that they could produce scurvy in men subsisting on a diet in which the vegetable element was fairly well represented," because, "if they were essential antecedents of the disease, the majority of cases would certainly have occurred while they were in action, and not"—as it was—"until they had for several weeks ceased to operate, and conditions of a totally different character had been substituted for them." Yet, though the conditions of the crews were very similar, there was a disparity in the number of cases of disease, 45 of the 70 men on the *Alert* being afflicted with scurvy, while only 15 men of the 52 on the *Discovery* were affected. To say that this was due to the prolonged absence of sunlight from the *Alert* is of course absurd, for it was only a question of four days; but a more marked difference was the greater amount of fresh meat—chiefly musk-ox beef—which the *Discovery* men enjoyed, though only irregularly and in limited quantities, while the *Alert* men lived chiefly on preserved and salt meat, not so well fitted to keep up health. The authors of the paper on scurvy, however, think that there is no ground for the supposition that fresh meat, in the ordinary cooked form, consumed in such moderate quantities as only one pound three or four times a week, and for a longer period one pound and a half, can exert any antiscorbutic power for several weeks after the consumption has altogether ceased. It is therefore held that "the conditions that existed on board the two ships during the winter do not appear to have any direct causal relationship to the outbreak of scurvy that subsequently occurred; nor indeed do they appear to have affected the health of the crews in any distinct or appreciable manner," though there was no doubt some deterioration of health.

The conclusion, therefore, is that the men, though rather flabby and with impaired strength, had no signs of scurvy until the sledging began, when 59 cases out of the 60 in this outbreak—one being an exceptional case on board ship—occurred. In Commander Markham's party one was taken ill on the eleventh day, another on the twelfth, and another on the sixteenth, and other cases followed in quick succession. In Lieutenant Beaumont's party one became ill on the seventeenth day; but this is not, as the writers show, an unprecedented circumstance in the history of scurvy, and there were causes to account for a speedy outbreak in this case. This was the sudden change which took place in their habits. The enforced inactivity of the winter ceased, the sledging began and a new system of dietary was introduced. The dietary on board ship is considered to have been sufficient, especially with the rations of lime-juice, to protect men against scorbutic disease; but in the sledging expedition the dietary was different, being of good quality, but novel, and difficult to take; and the excessive fatigue to which they were all at once subjected, without preparation, knocked them up. This part of the story has already been told, but the medical view of it is worth notice. In the longer expeditions "the pemmican was so stodgy it was like eating sawdust"; "the bacon was frozen so hard, and so intensely cold to the teeth, that none could eat it." Thus the men did not take their full rations; and it is probable that the cold would absorb a larger proportion of the total potential energy of the food in maintaining a normal temperature than had been expected, and further that the physical work was underestimated on account of exceptional difficulties. All this was, of course, trying for the men, and there can be no doubt that, under the circumstances, they were insufficiently nourished; but the medical opinion is that, though this might issue in starvation, in consumption, or other wasting malady, it would not bring on scurvy. Therefore another cause must be sought for this; and it is found in the absence of the liberal allowance of vegetable food in the ship dietary, together with a ration of one ounce of lime-juice, which in March was increased to two ounces on the *Alert*; while in the sledge dietary the vegetable element was only two ounces of preserved potatoes, a very insufficient quantity; and the bread baked on board ship was necessarily exchanged for biscuit. It is also pointed out that the contrast between the two dietaries in respect of the vegetable or antiscorbutic element is further increased by the absence of lime-juice in the sledge dietary, and to this is traced the serious outbreak of scurvy; for, though these were conditions favourable to the development of scurvy in the state of the sledgers, none of these were necessary antecedents of the disease. It is laid down that "the absence or deficiency of the vegetable element is the only known invariable antecedent of such an outbreak"; and that "lime-juice, on account of its well-established property of supplementing such a deficiency, may confidently be considered an adequate prevention against scurvy." It is added that the reputation of this specific has been increased by the experience of this expedition; because "fifty-eight cases of scurvy out of the sixty occurred in men who, for longer or shorter periods, had been deprived of lime-juice, as well as of vegetable food; while, at the

same time, they were not subjected to any other conditions which is known to cause scurvy, nor indeed had they all been brought equally under the influence of conditions indirectly favourable to the development of this disease." It also appears that, though lime-juice was excluded from the official dietary, it was carried and used by some of the minor sledging parties, and especially by those who started from the ships towards the latter part of the sledging season, or visited the depôts where lime-juice was stored, and that the sledge parties which suffered most severely from scurvy were not provided with it. The case is then summed up thus:—"The men had for several months been subjected to comparative inaction on board ship, and the influence there of many causes known to be unfavourable to healthy nutrition; they were then, without any preparation that can be regarded as adequate, placed in circumstances necessarily demanding a most active performance of the functions of nutrition, while the nature of these circumstances alone rendered such nutrition difficult, if not impossible. Coincidentally with these changed circumstances, they were deprived of a diet which contained, in quantity sufficient at any rate for ordinary circumstances, that kind of food shown by experience to be the most serviceable in preventing scurvy, and in its place received a diet in which this food was undoubtedly deficient."

Now that this authoritative and exhaustive Report, which represents the opinion of the highly competent medical members of the Committee after making a searching inquiry and after communication with the Royal Colleges of Physicians and Surgeons, has appeared, there must be practically an end to controversy on the question. It has been the object of official persons to attribute the breakdown of the expedition only to the physical difficulties which were encountered; but it is now made clear that, though these were accessory, the collapse was distinctly and directly due to the mismanagement of the commander. The fact is that the whole affair was got up in a hurry, perhaps in order to excite popular enthusiasm as a counterpoise to the discredit which had been cast on the administration of the navy by its engineering inefficiency; but it has only shown that this weakness pervades the whole department. The initial blunder was sending off the ships too late in the year, and also without sufficient thought and reflection as to the system of fitting and the methods of exploration. There was of course every desire to spare no expense, and to send out everything of the best quality; and no expedition was ever more liberally provided for. But there were many points on which improvements could have been made if proper counsel had been taken, and sufficient time allowed for deliberate and well-considered arrangements. Mere pluck and dash in an offhand way are of little good in such a piece of work; what is wanted is a thorough understanding of the nature and condition of the task, and strict adherence to instructions. Captain Nares not only wasted his time in idle excursions contrary to his sailing orders, but in his ignorant self-conceit treated his medical advisers with contempt, and deliberately withheld the lime-juice upon which the lives of the sledgers depended. Mr. Ward Hunt will perhaps now be sorry that he was so prematurely lavish of praise and honour to the commanders of this grossly blundered expedition; but it may perhaps be a warning to him for the future, and it may also be suggested that, when he has questions to answer, he may find it prudent to answer them in a less violent manner than he did on Thursday.

THE ROYAL ACADEMY.

III.

OUR notice of last week ended with the last picture in the first room of the Royal Academy. The picture which will attract most attention in the second Gallery is Mr. Long's "Egyptian Feast" (83). To this in the Catalogue is appended a quotation from Herodotus, Book II., which explains the artist's meaning:—"In social meetings among the rich, when the banquet is ended, slaves bring round to the several guests a bier on which there is a wooden image of a corpse, carved and painted to resemble nature as nearly as possible. As it is shown to each guest in turn, the attendant says, 'Gaze here, and drink, and be merry; for when you die such will you be.'" Mr. Long, on the authority of a note by Sir J. Gardner Wilkinson to Rawlinson's Herodotus, has substituted a mummy for a corpse; and this is being dragged on a kind of car around a semicircle of many guests who have arrived at the end of a feast. Upon different members of the company the sight produces varying effects. A girl by whom the image has just passed clasps her arm round the neck of a man, presumably her bridegroom, in half real, half playful terror. To the right of this pair a man whose character, to judge from his face, is that of one who has resolved to make the best of an unsatisfactory world, prepares to follow the precept "Drink and be merry," but pauses for a moment in thought with his goblet poised in his hand. To the left an old woman seems to regard the notion of inevitable death with a sadness which she is at no pains to conceal. But the painter has managed to indicate that it is no selfish dread that possesses her, but rather the feeling of regret for the incompleteness of life, which is common to thinking beings; and her sorrow seems to be quite as much for the possible troubles threatening the happy groups around her as for her own approaching end. On the opposite side of the picture is a group of careless girls playing on harps of the period; and beyond them is the figure of an almost naked

girl, leaning in careless thought against the base of an *Idol*. This figure is charming in its unconscious pose and its delicate grace. To the background of the picture Mr. Long has given an admirable effect of space, and the painting of the tessellated pavement is admirable. It might be possible to point out faults here and there in the drawing of individual groups and figures, and there is a certain want of motion about the people depicted which suggests that they all suddenly stood still on purpose to be painted; but there are merits in the performance which far outweigh such faults as these. Mr. Long's other picture, "An Ancient Custom" (163), in Gallery III., is a singularly graceful and pleasant picture, of the same clime and time, of a waiting-maid painting her mistress's eyebrows. On the wall opposite to Mr. Long's large picture hang Mr. Alma-Tadema's "The Seasons," four panels to which the painter has given some of his best work. For "Spring" we have a flowery meadow, deliciously green, with girls engaged in gathering blossoms, one of whom advances with light step towards the spectator. "Summer" is figured by two women in a marble-floored bath-room. One, the younger, is in the bath, on the surface of which float roseleaves, painted with a skill worthy of M. Fantin. The older reclines on a bench running round the room in an attitude made to express exactly the languor and drowsiness of a hot summer afternoon. The painting of the marble is masterly, and so is that of the reflection in it of the woman whose head leans against it as she lies in the bath; and the whole picture admirably expresses the painter's intention. If one were to find a fault with it, one might perhaps say there was too much insistence on the prevailing tone of yellow. The third period, "Autumn," is a Bacchante dancing with a lighted torch in her hand. The colour prevalent in this is red, and red of a not very pleasant hue, so that we turn with relief from it to "Winter"—three women and a child in arms, draped in grey and blue, sitting round a moveable fireplace beneath a marble column. Beyond this we catch a glimpse of wintry landscape, which makes us feel how grateful the fire must be to those who surround it. In Gallery No. VII. Mr. Alma-Tadema has another picture (597), "Between Hope and Fear." What may be the meaning of this picture—a girl with an inscrutable expression holding up a bunch of flowers, while an old gentleman, clad like herself in Roman costume, looks lazily on—we need not perhaps be at any great pains to discover. As to its execution, the girl's salmon-coloured robe does not strike us as more pleasing than the want of interest in her face; while, to make up for this, the painting of the flowers, the marble-topped table, and the silver jug and bowl, with their reflecting surfaces, is marvellously dexterous.

In spite of the praise which we have given to Mr. Alma-Tadema's "Seasons," we are inclined to think that his best work this year is to be found in the Grosvenor Gallery. Here, in the West Gallery, is to be seen "A Bath" (32), which is an exquisite piece of painting, representing Roman women bathing in a tank of the clearest and most liquid water, constantly supplied by a stream which falls on one of them from the mouth of a Sphinx in green marble. On the steps leading down to the water appears a waiting-maid beating towels; and in a corner on the other side, beyond a marble column, one sees a group of women who have already bathed bending towards each other with so natural an air that one can almost hear their chatter. There is not a fault to be found in the execution of this delicately contrived picture, and the distance which the painter has succeeded in conveying on a very small canvas is astonishing. "How the devil," said Oxberry, speaking of the first London audience that heard Kenn in Shylock, "so few of them managed to kick up such a row is to me a marvel"; and to us it is a marvel how Mr. Alma-Tadema within so small a frame has given us so much depth of space to look into. We cannot, for the present at any rate, dwell in detail upon Mr. Alma-Tadema's other contributions to the Grosvenor Gallery, which, according to the system of that exhibition, are all hung together; but we may point out that "Sunday Morning" (29), a mediæval scene which might belong either to Germany or Holland, shows that the artist is as capable of giving a charm to comparatively conventional subjects as he is of bringing the life of Rome before our eyes in vivid reality.

Not far from Mr. Alma-Tadema's "Seasons" in the Royal Academy hangs Mr. Hook's very fresh and bright "Word from the Missing" (126), in which two little children paddling about in a sea which looks excellently liquid have picked up a bottle containing a letter. The intentness of the little girl who looks at the bottle while her brother holds it is well expressed, and the vegetation running down a sloping cliff to the sea-line is brightly and pleasantly painted. In the same room we have Mr. Faed's "Little Cold Tooties" (125), a careful and pretty presentment of a peasant woman nursing her child, which is however as theatrical and affected as its title; and Mr. Calderon's "Constance" (59), a pretty head, far more satisfactory than the same painter's "Joan of Arc" (91), which can only be described as a complete failure. Between these hangs Mr. Pettie's "Knight of the Seventeenth Century" (96), a fine picture of a man in well-painted armour, which derives an additional interest from its excellence as a portrait of Mr. William Black, the well-known and popular novelist. Of M. Fantin's "Gilly Flowers and Cherry Blossoms" (74) there is no more to be said than what we have already indicated, that the work has all the delightful qualities of true and finished execution which belong to this painter. Nor of Mr. Leslie's "Cowslips" (101) is it easy to make any criticism beyond that the pretty group of figures has the artist's usual

charm of sweetness and also usual want of strength. Mr. Bromley's "Fairy Ring" (88) is an indication, which the painter's many friends and admirers will view with regret, of how much he might have done, had he lived, in a line before scarcely attempted by him. Mr. W. A. Shade's "Spring-time Idyl" (140) is full of delicate feeling, and of the promise of fine execution.

In Gallery No. III. the first picture that catches the eye, not only because it hangs opposite to the door, but also because of its intrinsic force, is Mr. John Collier's portrait of Major Forster (195). Major Forster is represented standing up in a conservatory against a background of green, trimming or plucking from a hanging basket of foliage. The likeness is admirable, the flesh tints are true, the pose well chosen, and the whole effect singularly real. The figure stands out in strong relief from the background; the texture of the grey dress is painted with absolute truth, but with no obtrusiveness; and the way in which the blue shirt and mauve tie are reconciled is singularly skilful. The painting of the whole thing is strong and firm without any tendency to sloppy and careless dashing on of colour. Near this portrait is "A Hazy Day in Snowdonia" (200), by Mr. Arthur Gilbert—a landscape which seems full of veiled light and distance. Praise is due also to Mr. T. B. Hardy's "Caught by the Gale" (206) for its truth and force, and to Mr. E. Bach's admirable characteristic and careful head, "One of the Old School" (207). M. De Bréanski's "Heyham, Morecambe Bay" (213) is a singularly vivid and bright landscape of the foreign school. Mr. H. R. Robertson's "Rush Harvest" (286) is a very quiet and delicate view of a stream on which is carried a boat laden with rushes. Against this load leans a simple girl, whose arm is laid round the neck of an old woman sitting by her. The picture is tender and full of suggestion. All the works which we have mentioned since Mr. Collier's are hung at the extreme limit of height, or, to use a technical phrase, "skied." When we look down to the line which is the place of honour, we find our eye attracted with a horrible fascination, as that of the bird is said to be by the serpent, by various works, among which is prominent "Spring-Time" (220), by Mr. Cope, R.A. Something has already been said of this; but it is so astounding and perplexing a work that one cannot avoid returning to it and wondering what fate would overtake Mr. Cope and other Royal Academicians of the same calibre if they were to submit their works to some gallery unfettered by traditions—say, for instance, to that of the Crystal Palace or the Royal Aquarium. On the line also, and next to "Spring-Time," one cannot but observe "The Time of Roses" (216), by Mr. F. Goodall, R.A., which is almost as happily calculated to adorn a seaside lodging-house's wall as Mr. Cope's effort. Mr. Goodall, however, is inferior to Mr. Cope in that his school is somewhat newer, and his work does not so pleasantly recall the memories of the coloured prints dear to our childhood. Of the other picture in this Gallery sent by Mr. Cope, R.A., "Bianca's Lovers" (280), it may be enough to say that there may be somewhere, for all we know to the contrary, a world where men and women are made and coloured as are the people here shown, and that the less we see of such a world the better we shall be pleased. The "Reflection" (259) of Mr. Hart, R.A. is almost more exciting by dint of the new ideas as to shape and tint which it suggests than the work just discussed. While we are speaking of those works of pure imagination which certain Royal Academicians have given us to contemplate, we may as well turn to "A Sussex Garden Glen" (1341), by Mr. E. W. Cooke, R.A. (hung on the line), in Gallery No. X. If any Sussex garden glen is by nature like this, there must be qualities in the soil of Sussex which are hitherto not generally known. It is no doubt gratifying to find Devonshire "tors" and Norfolk "broads," both on a reduced scale, adorning a lawn in Sussex; and it is not unamusing to observe hounds and huntsmen losing themselves among these strange phenomena. One may contemplate Mr. Cooke's picture with some pleasure; but it is marred by the want of the key with which to wind it up and set the figures in motion, generally associated with works of this class.

REVIEWS.

THE LIFE OF LORD ABINGER.*

LORD ABINGER was a man who deserved to have his life written. Not only was he for many years the acknowledged leader of the Common Law Bar, and afterwards Lord Chief Baron, but he was a man who struggled with and overcame peculiar difficulties; he was through all the more active part of his life associated with men of eminence; and he set a shining example of scrupulous honour in the political world. There is not, indeed, much to be said or learnt about him, for he never played any considerable part in public life. He had no remarkable success in the House of Commons or on the Bench; and that which really marked him off from his contemporaries—his singular gift for managing juries and getting verdicts—cannot be reproduced, or even described, by the pen of a biographer, and is naturally a gift that is thought of more when its possessor is alive than when he

has been dead many years. But his life had a story in it which was worth telling in a simple way; and, as he left a short autobiography, a few letters, and some notes on the leading men he had known, his son had not much to do beyond putting together the materials at his command. What he has had to do, however, Mr. Scarlett has done in a way to deserve the gratitude of the reader, for he is always clear and concise, and never falls into the fault which spoils almost all modern biography—that of heaping up insignificant details, and expanding what ought to be a short sketch into a work in many volumes by the simple expedient of inserting bushel after bushel of wearisome letters. Mr. Scarlett, in fact, had a very pleasant task to perform. For he writes with a twofold object, and both objects are near and dear to his heart. In the first place, he has desired to do justice to the memory of a father whom he loved and revered; and in the next place he longed to correct any inadequate idea which the British public may entertain as to the enormous antiquity and importance of the Scarlett family. A pocket in the cover of the volume contains the pedigree of the family, set out with elaborate minuteness; and we are over and over again assured that when the Scarlets emerged from the mists of antiquity they appeared as the Viscounts Carlat, and that, far from their being called after the colour, the colour was called after them. Lord Abinger himself was satisfied with the position of an English gentleman, and confined himself to the statement that he believed his family had held property in Suffolk and Essex. But the enthusiasm of the son of a newly made peer naturally seeks wider bounds; and if any one henceforth is ignorant of the grandeur of the Carlats, his ignorance must be pronounced to be of an invincible and wholly unwarranted kind, as the present author has done all that man could do to remove it.

Lord Abinger was born in Jamaica in 1769, a year fertile in the production of great men. His father was a landowner in the island, where he took a prominent part in local affairs; but Lord Abinger, in his autobiography, tells us that he was brought up with an abhorrence of slavery, and that his parents were most careful in guarding their children against the dangers of associating in any way with the negroes. He was a remarkably precocious boy in body and mind, ardently devoted to his lessons, and serving at the age of fourteen as a volunteer. When he was fifteen his father told him he was to go to England, get called to the Bar, and return to practise in Jamaica. He obeyed, arrived in England entirely his own master, entered an Inn of Court, and began to reside as a fellow-commoner in Trinity College, Cambridge. During his first Christmas vacation he paid a visit in a country house, and there, almost immediately after his sixteenth birthday, met and loved a young lady, whom six years afterwards he married. He resolved to create for himself an independent practice, so as to have a home to offer to the object of his affections. To form such a resolution at sixteen showed that he was by no means an ordinary boy; but to keep to it day after day, and year after year, without wavering and without discouragement, showed that he was a really remarkable one. He became a student, and a very zealous one, although he had to face a difficulty which any one acquainted with the Trinity of modern days seems the oddest that could have pressed on him. He could not find any one to teach him. He worked on, however, as well as he could; and when he was elected a member of an undergraduate club to which it was the height of the ambition of fashionable undergraduates to belong, he declined on the ground that he wanted to read. His boldness in refusing so high a distinction seemed wonderful even to himself; but steadfast love and zeal for knowledge prevailed, and he was saved from yielding to the attractions of a club which, according to the strange views of University discipline then prevailing, met alternately at Cambridge and Newmarket for the purpose of drinking. The courage he thus displayed drew to him the attention of some men of distinction in the College, and by one of them he was not only advised and stimulated in his reading, but introduced to Romilly and Porson. In his twentieth year he took his Bachelor's degree, and went to London, where he was called to the Bar in 1791, after having spent some time in a special pleader's office, the pupil who took his place on his retirement being Canning. He selected the Northern Circuit, and never knew the anxious pangs of a briefless barrister. For at Carlisle a brief was given him in a case the pleadings for which he had drawn in his tutor's chambers, and the mode in which he explained points in these pleadings during the trial won for him compliments from the judges. In due course he attended the Lancashire Sessions, and in 1792—that is, only a year and a quarter after he was called to the Bar—he found he was gaining ground so decisively that he allowed himself to be made happy at last, and ventured on the marriage to which he had been looking forward so long. The liberal allowance his father made him saved him from any real anxiety, although, in refusing to take advantage of his connexion in Jamaica and remaining in England, he ran some little risk; but from first to last his career was one of unchequered prosperity, and in 1798 his professional income exceeded his expenditure. Few barristers under the age of thirty have so pleasant a tale to tell.

"As to my life as a lawyer," Lord Abinger writes, "I have to say that, urged by the prospect of an increasing family as well as by the ambition which has never ceased to govern me, I devoted myself with increasing application to the duties of my profession." He worked hard, he spoke very well, and he succeeded. This is the sum of his professional history. For a long time he did not astain the silk gown which he justly considered his due, and

* A Memoir of the Rt. Honble. James First Lord Abinger. By the Hon. Peter Campbell Scarlett, C.B. London: Murray. 1877.

thought himself hardly treated by his friends the Whigs, who, when in power in 1806, neglected to bestow on him this mark of their recognition; and although he applied to Lord Eldon for a silk gown in 1807, his letter received no answer until 1816, when at last he got what he wanted. He became the indisputable leader of the Court of King's Bench and of the Northern Circuit; but it was not until 1827 that he became Attorney-General, and he received no offer of judicial promotion until, in 1834, having quarrelled with the Whigs, he was made Chief Baron with a peerage by the Duke of Wellington. He was a sound lawyer, and laborious and zealous in his conduct of a case; but it was neither learning nor assiduity that gave him his position, which was in its way unrivalled. What distinguished him was the consummate art with which he made himself the friend, the adviser, and the guide of a jury. There were, as it was said, really thirteen jurors when Scarlett was speaking. He and the jury talked confidentially over the case, and his twelve associates were naturally influenced by their extra foreman. In his autobiography he has left some record of the mode in which he proceeded, and if the secret had been one that could be communicated every rising barrister ought to learn the passage by heart. Something may be learnt from his revelation, but not perhaps much. It was the look, the gesture, the shrug, the smile, that really told, and these no explanation can teach to imitate. Still he had lessons to teach that might perhaps be learnt. He had a supreme contempt for what he calls tirades, in which the speaker airs his eloquence in order to be admired. A jury, he remarks, regard an eloquent man with the wonder and interest with which a crowd regards a man walking on a tight-rope. They are amused with watching his proceedings, and are surprised he does not fall off, but that is all. His speech has nothing to do with the verdict, which is a matter of business, while the speech is a mere matter of pleasure. Lord Abinger says that he himself always opened his case in the simplest way, and that he made it a rule to understate rather than overstate the facts he expected to prove. For, as he goes on to say, with a shrewdness worthy of Rochefoucauld, whatever strikes the mind of a juror as the result of his own observation and discovery makes always the strongest impression on him. He was very sparing in cross-examination, and seldom tried to shake the credit of a witness; for juries do not like displays of ingenuity to the disadvantage of a man who occupies an unpleasant public position for the moment. When he saw that the impression of the jury was against him, and that the case of the defendant was producing an uncomfortable amount of effect on them, he "made it a rule to treat the impression as very natural and reasonable," and invited the jury to follow him in a candid and temperate investigation, during which he contrived to make it gradually dawn on them that the plaintiff was quite in the right. He "rigidly abstained under such circumstances from any appearance of confidence, and left everything to the candour and good sense of the jury." These expositions of his little arts and subtleties are amusing; but nothing can make an advocate like Scarlett except being born one. It is not by disquisitions on the business and rendering of Hamlet that one man can teach another how to act; and Scarlett was a born actor who played one kind of part better than any one in the profession before or since.

One or two stories are told by Mr. Scarlett to illustrate his father's successful dexterity. On one occasion Scarlett was counsel with Patteson for his junior, and he told Patteson beforehand that he would make Brougham and Parke, who were opposed to him, produce a document which they desired to withhold as being insufficiently stamped. Patteson thought that Brougham might be induced to make a mistake, but that the wariness of Parke would be too much for his leader. Scarlett, we are told, conducted the case with such consummate dexterity, pretending to disbelieve the existence of the document, that Brougham and Parke resolved to produce it. Patteson, who told the story, described the air of extreme mortification and surprise of Scarlett on its production by Brougham with a flourish of trumpets about the "non-existence of which document his learned friend had reckoned on so confidently," and declared that the way in which Scarlett asked to look at the instrument and his assumed astonishment at the discovery of the insufficiency of the stamp was a masterpiece of acting. Then, again, on another occasion Scarlett was for the defence in an action of nuisance. A lady appeared as a witness for the plaintiff, and Scarlett began inquiring tenderly about her domestic relations, her children, and their illnesses. The lady became confidential, and appeared flattered by the kind interest taken in her. The Judge interposed with a remark about the irrelevancy of all this. Scarlett begged to be allowed to proceed, and on the conclusion of the cross-examination said, "My Lord, that is my case." He had shown that, in spite of the alleged nuisance, the lady had brought up a large and healthy family; and the jury, amused as well as convinced, gave him a verdict. These stories are only specimens of thousands which might be told of Scarlett, if any one could recollect them or thought it worth while to write them down. And as the administration of justice in England is to a certain extent a kind of game, in which adroitness is allowed to tell, it is satisfactory to know once for all how adroit a counsel can be. Scarlett's skill was indeed great enough to procure for him the approval of more critical judges than juries are generally likely to be. Coleridge the poet was in court when Scarlett made a speech against Cobbett, and pronounced it to be worthy of the best times of Greece or Rome. Such is the irresistible effect of manner; for a part of the speech selected by Mr. Scarlett as a favourable specimen is given in this volume, and nothing less like

the oratory of Demosthenes can be conceived than its caustic periods and heavy invective. What was really admirable in Scarlett was that, with all his art, subtlety, and dexterity as an advocate, no man in his own life could have been more simple, honourable, and straightforward. A long, but by no means tedious, account is given by Mr. Scarlett of the successive steps, and their causes, by which his father left the Whigs and joined the Tories. His conduct was in every way creditable to him. He thought the Reform Bill a measure full of danger to the country, and left his party rather than countenance it. In doing this he acted with sense and right feeling; not quitting his friends hurriedly, but telling them his opinions and working with them as long as he could. In those days a political lawyer had not only to behave well to his party and to the nation, but to the owners of boroughs who returned him according to the shade of his opinions; and Scarlett did his duty to his varying patrons in a loyal and discriminating manner. He was in turn much respected, and frankly welcomed in private society, although he was not made much of in public. The fact was that he was not of any very great use to his party, since he failed as a Parliamentary speaker, and was absorbed in private practice. Nevertheless he deserved high judicial promotion sooner than he obtained it, and had a feeling of justifiable soreness against those who he thought neglected him. Of his private life his son speaks with an affectionate admiration which was amply deserved. He had most of the social virtues in perfection, and led for three-quarters of a century as happy a life as probably any man in England. He was fortunate too in the time and manner of his death, and died in 1844, after a very short illness, while he was in the actual performance of his duties as Chief Baron on circuit. If he did not attain the highest eminence, he attained almost everything else to which a barrister can aspire.

▲ TRIP TO CASHMERE AND LADAK.*

CRITICISM of a work like that now before us ought to bear in mind the Horatian maxim of not resorting to the *flagellum* when the *scutica* will answer the purpose. A notice of every book ought to keep steadily in view the object of its author, and we have no right to find fault with him because he falls into some of a traveller's errors, or omits altogether novel and interesting topics which he is not qualified to handle with skill. Whether it was right to accede to the "suggestions of a few friends," and to convert "meagre notes" into a sporting tour of nearly two hundred pages, is a question which may be decided in two ways; but the volume before us is not difficult reading, and it may be useful to any one who, being restless and finding no claims on his time in England between March and November, is determined to set off somewhere. Mr. Lambert and three friends, being apparently in good health and having earned a holiday, chose India for good reasons in preference to America or Africa, and started for the only part of our Indian dependencies in which, at that period of the year, sporting can be had without exposure to a fiery hot wind or a thermometer of about 100 degrees. Mr. Lambert at once set his face to the hills and valleys of Kashmir, and experienced in his first fortnight divers ways of travelling, which connect the administration of Lord Lytton with that of Lord Dalhousie, and the latter era with Mohammedan and even Hindu times. From Bombay to Lahore he had the rail: thence he dropped into the not uncomfortable "dawk" carriage with its six-mile stages, its ponies with sore backs, its gesticulating driver, and shouting "syces." After crossing the Chenab, which, for its size alone, is one of the sights of Upper India, he arrived at Goozerat; and thence he had the benefit of a jolting in the primitive "ekka" till his party reached Bhumber, at the foot of the hills. The "ekka," which takes one or two passengers besides the driver, is a mere box, made of bamboo, on two wheels, light but not springy, and rarely resorted to by Englishmen. On cross roads, however, where there is not traffic enough to remunerate a "Transit Company," the traveller may have no resource but to mount one of these equipages, or have recourse to the *dhooly* or the palanquin. Once in the hills, the sportsmen went through the usual programme, and something besides. They stayed at Srinuggur; they stalked bears in the Tilla Valley; thence they went over a high pass to Dras, lying to the north-east of the capital; and from this place they made an excursion to Leh, the capital of Ladakh. With the exception of the last part of the trip, there was nothing extraordinary or peculiar in their experiences. They certainly climbed over very slippery and steep rocks; they endured heavy rain in their tents; they bathed in snow-fed streams, which is for many reasons not always a safe pastime; they put up with sour milk and short commons; and now and then they camped out at a great elevation, when in the pursuit of bears and ibex, with no better cover than a blanket and a few boughs of pine. It is to their credit that, though evidently novices in Indian travelling and ignorant of any native dialect, they generally managed to avoid disputes with petty officials and coolies. Once they had a squabble with the crew of a rival boat who were tracking up the river Jhelum, between the Wular Lake and the capital, for the travellers entered the valley by the orthodox route *via* Saidabad, Noushahra, Punnah, and the Ruttanpir, as the Pir Panjal was not yet free from snow. Another time the writer resorted to

* A Trip to Cashmere and Ladakh. By Cowley Lambert, F.R.G.S. London: Henry S. King & Co. 1877.

the questionable expedient of depriving the Kotwal, or head policeman, of his outer garments, until he procured some milk for the party; but, all things considered, they managed to get on very fairly; and though the bag of game was not large, the deficiency was not due to want of energy or bad shooting. The truth is, that parts of Kashmir have been overworked, and that, however successful a rifleman may be on the Grampians, some familiarity with the habits of Himalayan game and ability to talk freely to native trackers are requisite for sportsmen who would emulate Colonel Markham, Captain Baldwin, or the Old Shekarry.

Not the least interesting part of this tour is where we hear very little of the object for which it was professedly undertaken. Crossing from Deras to Leh, the author came across several members of Sir D. Forsyth's mission to Yarkand. A very good picture is given of the spot where Dr. Stolickza lies buried; and the drawings of a bazaar at Leh, and of Leh itself as seen from a distance, are extremely good of their kind. The latter view has a sort of resemblance to Balmoral. While in Ladakh Mr. Lambert saw that rare animal the snow leopard, and seems to have been disappointed in not finding some hare and snipe in a garden at Golab Bagh, about eleven miles from Leh; although, judging from the habits of the scolopax and the description of the country, disappointment would have been caused by finding any snipe in such a place, unless the birds were resting there for a few hours in transit. A game at polo in its original form was witnessed, the playground being a clear space in the bazaar itself, and the performance taking place under the stimulant of an orchestra composed of four drums, as many flageolets, and six trombones. The game was enlivened by certain incidents which would cause astonishment at Lillie Bridge. The captain dropped the reins of his pony when he gave what in football would be called the "kick off," and it seems that when the ball is hit fairly down to the goal by one party, an adversary can still prevent a score, and claim a no-goal, by jumping off his pony and returning the ball before the successful striker can follow up his advantage and touch it himself. There seems to have been more amusement in this sort of sport than in a native Nautch which followed, and which so far differs from the said institution in the plains that men took part in it. We can well believe that this monotonous movement deserved the epithets of "stupid, dreary, and idiotic," which the author bestows on it. From Leh the party wisely returned by a different route, pointed out to them by Mr. Shaw the Trans-Himalayan traveller, and here, finding fruit in abundance and the harvest ripe, Mr. Lambert notices a curious custom of pulling up the stalks by their roots, instead of cutting them. The reason apparently is, that the roots serve for fuel in a country where wood is scarce. We give this fact as the result of Mr. Lambert's own observation, because it is clear that, when he depends on what he heard, he, or rather the information given him, is not always to be relied on. For instance, in describing the manufacture of ice at Lahore, he says, correctly enough, that ice is made in shallow dishes placed on straw in oblong pits about nine or ten inches in depth, and that, just before daylight, each pan is covered with a thin cake of ice, which is taken to the ice-house and pounded up into a solid mass, in order that it may last through the hot weather. But when he says that the ice is made by the "cold wind sweeping over the ground between six and eight in the morning," it is obvious that he misapprehended the nature and conditions of the process. Ice for the Station Club is formed by evaporation, and complete stillness, and not motion, of the atmosphere is requisite. A sharp wind ruins the hopes of the members of the ice-club. What is wanted, just before and after Christmas, is a fortnight or three weeks of calm cold nights, and then ice can be made when the thermometer is some degrees above freezing-point. We have seen a fine crop as low down as Benares with the thermometer at 38°, and it used many years ago to be made at Hooghly, in the neighbourhood of Calcutta, on a solitary plot of ground which favoured evaporation in some mysterious fashion, for ice is not made artificially, we believe, anywhere below Benares. Mr. Lambert's tour was brought to an end by a visit to the modern city of Jyepore and to the ancient city of Amber, and these pages bear testimony, if any were needed, to the skill with which the city has been laid out, to the beauty of the gardens and the lake, and to the generally enlightened spirit evinced by the Maharaja, who has founded a large hospital in memory of Lord Mayo.

In an appendix, and here and there in the body of the narrative, Mr. Lambert gives a few hints to travellers who may be induced to follow his example. In what he says about equipment, dress, and the policy of purchasing small and portable articles in England, and camp furniture at Lahore, we entirely agree. But it strikes us that he has considerably underestimated the expense of such a trip. He may certainly get to Lahore, with good management, for 100*l.*, and back again for the same sum. But he must be uncommonly lucky if he gets a hill tent, with camp tables and chairs, bed and bedding, pots, plates, and pans, for a hundred rupees or ten pounds. Neither will the sum of a hundred rupees a month represent the cost of living, even though lean fowls and thin cakes of flour are supplemented by black partridge and water-fowl, which cost nothing except powder and shot. Fifty rupees a month would soon be spent in the wages of servants, and there should always be a liberal margin for breakages, carriage of additional stores, remuneration to coolies who have to be paid for extra work, warm clothing for servants who may strike work in camp for want of a good blanket

or a *risai*, and for rewards to be given to experienced native hunters, who will pilot the sportsman to a hole into which they have marked a she-bear and her cubs, or to some rock from which a splendid view may be obtained of half a dozen *markhor* or *burak*. Nothing is likely to prove a better investment than a few rupees of *bakshish*, which may result in a splendid skin or a fine antlered head. Mr. Lambert puts the total expense of his trip at three hundred pounds. We should be inclined to raise it to at least five hundred pounds, and this allows no expenditure on those elegant Oriental articles which the journey of the Prince of Wales has brought more into fashion than before. Few travellers can resist the lacquered ware or the silver owners of Kashmir, still less the tempting display of brocade and scarfs pressed on the bewildered foreigner with such admirable taste and temper by the Manick Chunds of Delhi.

Mr. Lambert says nothing about politics, but there is one point of view in which such tours have a political bearing. The most ardent sportsman, who thinks only of bears and express rifles, cannot well return without having gained some notion of the vastness of our Indian Empire, of the density of its population, of the quiet, unobtrusive, solid work which is there being performed by a few hundreds of his countrymen, and of the scope and difficulty of the political problems which some glib writers in this country are ready to solve at ten minutes' notice.

We subjoin an extract from Mr. Lambert's jottings about the beauty of the scenery, because it compresses a good deal into a small space without exaggeration (p. 27). It is very appropriate to Sir Wilfrid Lawson's late speech about the lowering of cattle and the boredom of the House of Commons:—

I awoke just as we were entering the Wular Lake. The sun was rising over the mountain tops, and bathing the valley in a flood of golden light. Everything seemed to speak of peace and happiness; the little farmhouses, like wooden toys, perched on islands; the green fields and gay orchards; the lowing of cattle, the bleating of sheep and goats, the crowing and cackling of the domestic fowl, the clouds of ducks flying over our heads, the lake dotted all over with tiny fishing-boats, and around the whole the wonderful wall of snow. When I looked at this picture I almost believed the tradition that this was the original garden of Eden.

Nothing, indeed, was wanting to the above picture except Sir Philip Sidney's typical shepherd-boy, who was described as "piping as though he should ne'er grow old"; and if Englishmen wish to see the natural beauties of more than one land combined in harmonious proportion, they cannot do better than follow the author's example, and, with or without their sporting equipment, take a summer's trip to Kashmir.

ALFRED DE MUSSET.*

M. PAUL DE MUSSET is perhaps best known to English readers as the author of a disagreeable answer to a book which should never have been written. He now appears, not as the novelist who in *Lut et Elle* mingled fact and fiction, but as the biographer of his distinguished brother—"the man," he says, "whom I have loved above all others, and who found in me his most faithful friend." Readers will remember Alfred de Musset's verses on M. Paul de Musset's return from Italy:—

Ami, ne t'en va plus si loin,
D'un peu d'aide j'ai grand besoin,
Quoi qu'il m'advienne.
Je ne sais où va mon chemin,
Mais je marche mieux quand ma main
Serre la tienne.

Not sharing the temperament which to the poet made life a series of disconnected moments of surprises, delights, and despair, M. Paul de Musset has told the story of that life, as it were, from without. In Musset's poetry the most sincere and deep-lying emotion is an anxious scepticism which blasphemes in the absence of hope. One often feels that his was a nature which could not abandon the pleasures of passion, and of "riding at adventure" through life, without some certainty of a distant reward. In an age of faith he would have ended in the cloister. But, faith being beyond his reach, he was tormented by an endless inward struggle, the struggle of the child within him against the man. M. Paul de Musset's book lets us see where this struggle was real—namely, after a great sorrow—and where the poet in his younger days only affected the agonies of scepticism. But the biographer is less interested than one might expect in this part of his brother's character and experience.

Alfred de Musset, the descendant of an ancient family—"il avait la pucelle d'Orléans pour aïeule"—was born in an old quarter of Paris, now Haussmannized, on December 11, 1810. As a child he was remarkable for precocious intelligence and impatience:—

When he was three years old some one brought him a new pair of red shoes, which took his fancy. He was dressed, and was eager to go out in his new shoes, and his mother detaining him while she combed his long fair curls, he stamped with eagerness, and at last cried out piteously, "Mother, make haste, my new shoes will be old!"

This was characteristic of him who afterwards described the poetical nature thus:—

Suppose there is something that you love, be it a woman, your friend, your country, your house, your favourite room, what you will. Suppose you are returning from a journey; you enter Paris, you are kept waiting at the *Ostroi*; well, if you are capable of any emotion, you feel some pleasure, don't you, some impatience of expectation, your heart beats as you turn

* *Biographie de Alfred de Musset. Par Paul de Musset. Paris: Alphonse Lemerre. Charpentier. 1877.*

the corner of the street, and draw near to what you long for? Take it that you have the same feeling for everything in the world; that your life is an endless voyage, every fence your frontier, each house your home; that your children await you on every threshold—this is what the poet feels. This is what I was at twenty.

A promise of this eagerness in which the poet's life burned itself away was given by a love affair at nine years old; the story of Byron and Mary Chaworth repeated itself, and De Musset was a schoolboy grown before it was thought safe to let him know that his cousin had married and forsaken him.

The defeat of the Emperor, his exile, the Hundred Days, and Waterloo, came to puzzle and excite the child, but not to sadden him for any length of time. One of the invaders, a Hungarian hussar, was billeted in the house where the family lived, and soon was on a very friendly footing with the two little boys. Their minds were diverted from the wrongs of the Emperor to those of Roland and Oliver and the peers who fell at Roncesvaux, and for years their chief sport was playing at chivalry. From home and all the imaginative delights of clever boys of ten, Alfred, like other curled darlings, was sent to school, where his curls and cleverness only got him cuffs and kicks from the envious. As the head boy of his form in the Collège Henri IV. he became the friend of the young Orleans Princes, and, as boys say, knew them at home, at the Château de Neuilly. This must have been the time when, as Musset writes in the *Confession*, "les jeunes gens sortirent des écoles avec le front serein, le visage frais et vermeil, et le blasphème à la bouche." M. Paul de Musset has only preserved one example of schoolboy flippancy. Ferdinand P. d'Orléans writes that he has been at a wild-beast show, where the showman declared that the elephant, "by a religious instinct, salutes the appearance of dawn." "Où diable la religion va-t-elle se nicher?" asks the wicked prince, with an appropriate memory of Molière.

Musset left school with no intention of adopting a profession. He thought he might be a philosopher, and he read speculative writers, from Spinoza to Cabanis, with an effect on his thoughts and poetry which his brother scarcely takes into account. He followed painting for a while, and retained some skill as a caricaturist. When about seventeen he fell in with the verses of André Chénier, newly published by De la Touche, and imitated them with little success. But this was the deciding moment in his life. When once he had tasted the pleasure of versifying he returned to the attempt, and, in a spirit of schoolboy ambition, wrote several prize poems, which were successful. It was the time of the *Chénade*. Victor Hugo took his friends to the roof of Notre Dame in the evening, and contemplated the setting sun above the roofs of Paris. Then the poets would go home to supper, and mutual admiration would set in. Musset—he was only eighteen—wrote his poem of Spanish intrigue, like the rest, and a tremendous poem it was. Agnes de Guadarrá had twice been a bride; twice at the altar had she clasped the cold hand of a dying man. The bravo Don Carlos wooed her, and on the wedding day found that it was his own brother, a monk, who, for love of Agnes, had poisoned each and all of her bridegrooms. The kinsmen fight a duel, Carlos is slain on the stage, Agnes goes into a convent. It is all very absurd, but scarcely more absurd than *La Coupe et les Lèvres*, one of Musset's published pieces.

The well-known song "L'Andalous" was even a greater success than "Agnes." "L'Andalous" and some other verses of this period succeeded in doing what the other young Romantic poets were always trying, and failing to achieve. Having made his point, Musset passed on to other things; but some of his contemporaries did not forgive him for deserting the style which they admired. The poet, a pretty page, as his brother says, with clustering locks, now began to have adventures, and, to cut a long story short, was the spoiled favourite of women whom he could not respect. He gambled, danced, intrigued, and fulfilled all the duties of the dandy of the time. Lady novelists have written descriptions of his coat, his ruffles, his buttons, and the curls that floated, as Thackeray writes, "on the fashionable shoulders." It was inevitable that he should be spoiled, and inevitable that he should make enemies. Gustave Planché began a promising feud by reporting or inventing some story about Musset and the young lady commemorated as Pépa—Pépa whose thoughts turn at night

Peut-être aux tendres confidences
D'un cœur naïf comme le tien,
A ta robe, aux airs que tu dances;
Peut-être à moi, peut-être à rien.

Even after publishing his second volume of poems, which pleased the Romantic people less than his first, Musset declared that his genius needed a great passion, a real sorrow. He appealed to grief like the boy who went about with open breast, crying "Aura veni!" and he soon got what he asked for. It was not that his father died, or that he wanted money, or that his play *La Nuit Venitienne* was damned. Real trouble was at the door. In 1833 every one was talking of a new novel, *Indiana*, Musset read it, liked it, and passed his pencil through the too frequent adjectives which, in his opinion, disfigured the style. Soon afterwards he met George Sand—whether she really wore a dagger, as in *Lui et Elle*, we are not told—at a dinner given by M. Balot. M. Paul de Musset prints an amusing anecdote of the life which the two people of genius soon led together. They invited the grave philosopher of the *Revue*, Lermier, to meet Debureau, a famous clown and pantomimist of that date. Debureau was to pretend to be a member of the English Government on a secret mission to Vienna. During dinner, at which

Musset waited in the dress of a servant-girl, Debureau maintained an insular reserve and silence. No allusion to Sir Paul or Lord Stanley made him open his lips. At last some one mentioned the balance of power. Then the English statesman roused himself. "Do you wish to know," he said, "how I understand the European equilibrium, and the policy of England? I shall try to illustrate my meaning clearly." So speaking, he tossed his plate into the air, imparted to it a rotatory motion, and caught it, still spinning, on the point of his knife, where it remained twirling, to the great astonishment of M. Lermier. Politics were not mentioned during the remainder of the evening.

Musset and George Sand left Paris together for Italy, in spite of the opposition of the poet's mother. Mme. Dudevant paid her a visit, and declared that she would bestow on the young man "une affection et des soins maternels." Meanwhile, "some one else was bestowing, it may be presumed, on her own offspring all the care and affection which she reserved for the *Enfant du Siècle*. The world has before it some five or six accounts of the journey to Italy. M. Paul de Musset adds nothing new, beyond the fact that the name of the doctor who attended the poet at Venice, who became, as he fancied in a delirious hour, his rival, and who saved his life, was Pagello. M. Pagello still practised at Belluno in 1863, surviving the cyclone of passions into which he was drawn. Did George Sand really see, as is hinted in *Lui et Elle*, the copy of *Indiana* with De Musset's corrections? All this, with the rest of the miserable story, is passed over in silence. Whether he were more sinned against or sinning, the poet came home to his mother and brother in possession of a sorrow which, this time, was genuine. In the fragment called "Un Poëte déchu" Alfred de Musset wrote:—"My thoughts seemed to fall like dead leaves, while I knew not what sentiment, terribly sad and tender, awoke in my heart. I shut myself up in my room; for four months I wept continually; I saw scarce any one, and had no amusement except a game of chess which I played mechanically every evening. As I grew more tranquil, I looked round on all that I had left at home. With the first book I opened I felt that something had changed. An old picture, a tragedy that I knew by heart, a conversation with a friend—everything surprised me, in nothing did I find its old significance." There is no affectation here. Was Musset's heart apt for jealousy and suspicion, full of doubt and disbelief in men and women, before his great passion? From his *L'Enfant du Siècle* we gather that it was so. In verse he takes another view:—

Il était gai, jeune, et hardi;
Il se jetait en étourdi
A l'aventure.

For the future his heart, with as great a need of love as ever, perhaps with as great a misconception of the meaning of love, was embittered and sombre.

Musset was still very young, only twenty-four; he weeded his library, changed his old favourite pictures for engravings after Raffaele, and made a new start in life. It was long before prints after Titian even were admitted into the cell of this anchorite. The play *On ne badine pas avec l'amour* is full of his fresh earnestness. In the midst of renewals of his old intrigue he produced in one year *La Confession*, *La Nuit de Décembre*, *La Nuit de Mai*, as well as other works. *Les Nuits* were really written at midnight. The poet would come home with words and lines haunting him like music. He would light all the candles and lamps in the house, and illuminate his study with them for the reception of the Muse. From midnight till dawn he wrote, and when he awakened next day and read through the poem he found nothing to change. After the excitement of composition he returned to real life like a mortal come back to earth from fairyland, full of a profound melancholy which a new flirtation would dispel. The original of Mimi Pinson was eminently suited to drive care away. In praise of her the poet began *La Nuit de Juin*, a poem which was to be as glad as the other *Nuits* are gloomy. Unluckily a friend asked Musset to meet Felix Arvers, a writer famous for one sonnet, so the lamps of song were never lit, and the Muse did not descend that night of June. Nothing remains of the poem but a large sheet of paper, yellow with time, the title written out fairly, and four lines:—

Muse, quand le bled pousse il faut être joyeux.
Regarde ces côtes et leur blonde parure.
Quelle douce clarté dans l'immense nature!
Tout ce qui vit ce soir doit se sentir heureux.

As great a failure, in another way, was the congratulatory poem on Louis-Philippe's fourth escape from assassination. The verses were shown to the citizen-mesarch, who hated poetry, and was hurt at being addressed in the second person singular. His Majesty, however, not only forgave, but forgot this offence, and when Musset came to his reception, addressed him most generously, under the delusion that he was another Musset, a ranger of royal woods and forests.

Musset's love of the theatre, in which his pieces were tardily welcomed, brought him into connexion with Rachel. The tragedy which he ought to have written for the great actress was never finished. Long after the supper at her house which Musset described so pleasantly, Mlle. Rachel made him accept a ring, which he was to keep as long as he entertained the idea of being her poet. After many quarrels and reconciliations the ring was restored, and *Racine* remains a fragment. At this time, in addition to his religious doubts and sentimental sorrows, Musset suffered from "the ignoble melancholy of peevishness and sentiment." Gambling was a passion with him, as may be gathered

from countless allusions in his poems, in *Une Bonne Fortune*, *Rolla*, *Pensées de Rastoul*, and others. Pressed by want of money, and by the persistent M. Buloz, he promised to write some stories in prose for the *Revue*. Repentance followed promptly. He declared that prose was the ruin of literature, that he would not overwork his muse, nor employ a coarse instrument on which every *feuilletoniste* could play. *Finis prose*, he wrote, in 1839, at the end of the piece called *Croisilles*. But if he did not write prose, he could not keep his engagements, and he was distracted between the fear of this dishonour and the inability to wring anything but personal recollections from his tired brain. In this condition he entered M. Paul de Musset's room at night, and took away his pistols; but, fortunately, could not find the cartridges. Next day came an invitation from Rachel, and Musset, with his usual levity, forgot his troubles in a visit to the country house of the actress.

Musset's repugnance to work at this period may have been caused by the languor of an approaching illness. He was nursed by the "Sister Marcelline," a good creature in whose honour he wrote a poem which he never allowed to be printed. It was, indeed, with a sort of shame and remorse that he permitted *Souvenir*, the very beautiful verses suggested by a chance encounter with George Sand, to be "thrown as spoil to every gossip." He made great promises of improved conduct to the Sister Marcelline, and his affairs, as well as his health, improved in 1842. M. Charpentier began to publish cheap editions of contemporary writers, and the profits on his works freed Musset from the bondage to prose; the success of his acted pieces in 1848 added to his income. With reference to these it is curious that M. de Musset, while he pays a well-deserved compliment to some of the actors who made his brother's plays known to the audiences of the Théâtre Français, says nothing of the one player—M. Delaunay—who has understood and revealed Musset more fully than any one else to the Parisian public. But he had more cruel masters than even debt; passions and habits from which, in spite of the sermons of "the godmother," as he called a lady friend—and of the Sister Marcelline—he could not emancipate himself. Among some strange reflections made by him at the age of thirty, when he was "a young man with a glorious past," this occurs:—"There is one wild effort to make—to go on being a child! And yet this showed fair in the beloved of the Gods, Mozart, Raphaël, Byron, Weber." Musset lived longer than those whom the gods love; his later years were those of an invalid with many chagrins. Sainte-Beuve, his old ally, turned against him. "Lamartine vieillit me traite en enfant," he complained. His last verses, still occupied with himself, were almost the sigh of a hypochondriac. M. de Musset tells many anecdotes of his tenderness of heart. He had the power of winning affection: through all the affectation of his verses his moods of gaiety still attract and charm, with the charm of a wayward child. To modify the pathetic words of the oldest poetry, "the Muse loved him, and gave him good things and evil; of strength she bereft him, but gave him the sweetest song." The temptations which conquered Burns overcame him far more easily, and his fall, being that of a lighter and weaker nature, was less tragic and more pitiful.

THE CHEVELEY NOVELS.*

ORIGINALITY in form and audacity of treatment are assuredly not the most conspicuous qualities of modern fiction. When authors make their maiden efforts they keep for the most part to well-worn tracks; while publishers stick to the time-honoured fiction that any three volumes of average demerit ought to command their guinea-and-a-half in the market. The shilling form of serial publication which was in favour more than a generation ago with the greater masters of the art has long since gone out of date; and attempts at its resumption have been anything but successful. The conditions of the novel trade have changed now that all the world has taken to novel-writing. So that the mere circumstance of an anonymous writer, who is presumably a novice in fiction, venturing in some sort to provoke a comparison with Dickens and Thackeray in their prime, would be sufficient of itself to awaken curiosity. But the courageous author of the *Cheveley Novels* has by no means limited his ambition to the manner of his venture. *A Modern Minister*, the first part of which has just made its appearance, is, it seems, to be the "initial" novel of an important series. It is only from the brief dedication that we get any inkling of the writer's intentions; but we are induced to believe that the series will be a sequence, involving the history and fortunes of a crowd of characters, and assuredly an ample canvas will be needed to do bare justice to the conception. For the *dramatis personæ* are formally catalogued by way of prologue—indeed the cast of the story, with its situations, is distinctly dramatic throughout—their names and qualities occupy three and a half closely-printed pages, and in number they are no fewer than a hundred and twenty. The unknown writer would appear to have deliberately committed himself to such a comprehensive scheme as grew gradually upon Balzac, absorbing the whole of the life and thoughts of that indefatigable anatomist of human nature. We are led to expect a sort of English *Comédie humaine*, where representatives of each class and type of modern society are to play their parts; the pathetic is to be blended with the

humorous; social scenes are to be depicted in almost bewildering variety; while, with the dramatic element predominating over all, the whole is enveloped in an atmosphere of mystery that thins lightly here and there to give us glimpses of thrilling complications. For the writer's ambition does not rest on the development of a single literary speciality. From what we have said it may be inferred that this is a novel of character. And so it is; but it is not pre-eminently so. For the author has evidently been devising and elaborating a plot of extraordinary intricacy, and above all things the story promises to be sensational. As we have often argued, there is no reason in the world why the sensational should be tabooed as inartistic simply because it has been abused and overdone by a certain school who have found it a short cut to commonplace popularity. Sensation judiciously subordinated went far to make the fortune of another series of books by a far greater "Unknown"; and many of our ablest writers have imitated the author of *Waverley*. But in this instance the sensational is so lavishly employed that, although it has succeeded in awakening our interest, it is suggestive of apprehension as well as of promise. Although the writer shows no little power, we feel that his power must be altogether out of the common if he is to finish his story successfully on the bold lines he has laid down. It is too soon to speak with any certainty, but already we think we can distinguish signs of a dangerous tendency to overdo the melodramatic. This at least seems certain, that, if he attains the success at which he aims, his success will be very striking; and the genuine talent he displays in many ways makes his undertaking a literary experiment which will be followed with no little interest.

In the very title of this first of his novels the author plays fast and loose with conventionalities by suggesting a double misconception. Naturally one's first impression is that the "Modern Minister" must be one of the official advisers of the Crown, especially as the story is emphatically a story of the great world. Or, as an alternative, we might fancy on second thoughts that the hero might possibly be a Presbyterian divine, the more so that the publication comes from the north of the Tweed. We remember the very natural mistake of Jeannie Deans in her memorable interview with his Grace of Argyll, when the mention of "a minister" had but a single meaning for the simple Scotch lassie whose father had been a worthy pillar of the Kirk. As a matter of fact, however, the minister in this instance is not only in the Church, but in the Church of England. In the first chapter we are introduced to the Rev. Westley Garland, the most popular preacher in fashionable Brighton; a man of moving eloquence and melancholy experiences, to the secret of whose painful antecedents we shall no doubt sooner or later have the clue. We may remark in passing that, in formally introducing him, the author has one of those trivial verbal touches the use of which was one of Thackeray's happiest talents, although they may sound more or less humorous as they chance to strike the fancy. "Of all the clergy who had supplied Brighton tea-tables with gossip, Westley Garland was the most provoking man; he was so mysterious, so handsome, so wealthy, so talented, so unmarried." But, though we should be bound to believe Mr. Garland to be the hero, since the author says so, the trick that has been played us in the title confirms a certain doubt on the point. For unquestionably, according to present appearances, it is a Mr. John Barnard who is to play the leading part; and, had we been asked to name the book from the present number, we should have christened it (only that the title is, we believe, already appropriated) the "Modern Mephistopheles." For Mr. Barnard is the very incarnation of the powers of evil, possessing a fair share of the subtle malignity with which we are in the habit of crediting the arch enemy of man, and with the satanic attribute of supernatural bodily activity, which is likely to make him terribly formidable. There is a swift shifting of the scenes; in quick succession we are hurried from place to place and from group to group of different characters; but all the various interests converge in this Mr. Barnard. Either he stands out confessedly the central figure, or else he is seen flitting dimly in the background. The preliminary sketch of Barnard and his relations with everybody illustrates what we think may prove the besetting risk of the author, though it is a risk he could very easily eschew. He is prone to exaggerate his situations gratuitously. He shows a tendency even in trivial details to string his story to sensation pitch, so that we sometimes long, by way of relief, for more tranquillity of action and less singularity of character. There are but few of the most prominent personages who have not traits in their idiosyncrasies amounting to eccentricity; and there is an unusual quantity of ugly skeletons locked away in mysterious cupboards. Thus, for example, a misanthrope of birth and position, a man of refinement and strong domestic affections, makes himself the silent accomplice of what would have been a murder save for an almost miraculous interposition of Providence. Again, there is a powerful and pathetic picture of a widowed wife and her orphan child left unbefriended in the hour of their bereavement, which is weakened rather than otherwise by the overcolouring of the material wretchedness of their surroundings, since such misery overtasks our credulity, considering their connexions and circumstances. There is generally a lavish use of theatrical properties in the arrangement of interiors, which are in the extreme either of destitution or of gorgeous and fantastic luxury. Such devices of the art are what we might expect in a shallow and feeble writer who has to fall back upon adventitious effects and make the most of ingenious tricks of description. But we protest against them the more decidedly in this instance because the author might

* *The Cheveley Novels. A Modern Minister. Part I.* London and Edinburgh: Blackwood & Sons. 1877.

obviously gain by dispensing with them, or at least by a more discreet regulation of their use. He has almost a superabundance of imagination and invention; and if he would write in a quiet and natural style, he might make his realistic sketches sufficiently striking without setting them off by the accumulation of stage properties. It would be premature to pronounce on his insight into character; the more so that his talent will soon be taxed to the utmost in shading away the numerous individualities which he collects and contrasts. But in placing his figures before us in outline he gives the impression of a sharp and confident touch; and we shall be disappointed should he seek to attract us by violence of action, in place of leaving them to come forward and explain themselves naturally.

This may be the author's first appearance as a novelist; but we should not have discovered the fact either from his workmanship or his style. If he is a novice in literature, he should go far, as the French say, for already he knows much by intuition which others have to learn by practice and failures. Ambitious as is the scope of the story, it is launched with no appearance of effort; the changes of scene, which seem to have no present link of connexion except in so far as it is supplied by Barnard's concern in them, are accomplished with no sense of violent transition; and the style is easy and flexible when the author chooses, although it almost follows from what we have said of his tendencies that it is apt to border on the melodramatic, and would be more impressive were it more subdued. We have said, "when the author chooses," for, too frequently, he does not so choose; and one is every now and then puzzled and irritated by perversely clumsy turns of speech from which it is difficult to extract a meaning. One can guess what is meant by a lady's "bustling about with that constituent the unkind call fussiness," and by "the bronze dolphin central of the genteel square"; but such experiments on the English language are not pleasant to see. The writer has also a morbid fondness for the odious modern mannerism of stringing jerky descriptive phrases together in verbless sentences, which are really no sentences at all. These offences against good taste and English grammar are the more exasperating because the author can evidently write well enough when he pleases. He has the eye of an artist for telling, pleasing, or touching situations; and there is the genuine feeling of a poet in many of the descriptive passages. In these, too, there is variety of subjects to address itself to every taste. There are Brighton and London, the West End and the East, soft woodland landscapes and stern coast scenery, sunlight, starlight, calm, and storm; just as the personages range from the nobility and clergy, through all ranks and conditions of men, down to the dwellers in Bohemia and the avowed professors of rascality. We have spoken throughout of the authorship in the masculine; but, on the whole, we shall not be surprised if it turns out that the book is written by a lady, notwithstanding the varied programme of the characters, which would seem to argue the other way. Should the fact be otherwise, the author shows even more versatility than we think can reasonably be taken for granted. We need not go at length into the grounds of our conjecture. They are to be found in certain turns of the style; in what appear to be some trivial social inaccuracies natural enough in a lady, however extensive her knowledge of the world; and in the fervour and knowledge thrown into descriptions of the feminine toilet. Yet it is possible that, after all, these may be assumed for the purposes of disguise. Without committing ourselves to an opinion as to the success or failure of a story where the author is playing a daring game, with not a few chances in his favour, against difficulties that are partly of his own creating, we think that we may safely introduce him to our readers as one whose progress ought to repay the watching.

STEPHEN'S DIGEST OF THE CRIMINAL LAW.*

TO the small section of the English public which appreciates the importance of codification and is interested in its accomplishment, this volume will be welcome as establishing by practical demonstration the feasibility of the process when applied to one of the most important, and at the same time one of the most tangled, chapters of English law. For the most sceptical opponent of reform must, with this Digest in his hands, be constrained to admit that the English law of crime is susceptible of concise statement, methodical and intelligible arrangement, explicit definition, and logical symmetry; and that, though the final process of casting the material thus arranged and prepared into an actual code has yet to be performed by the Legislature, still the main difficulties of the task have been overcome, and the portion of the work that remains to be completed is little more than formal. That we have before us satisfactory proof that a code is thus easily within our reach is owing to the industry and skill which Sir James Stephen has brought to bear upon his self-imposed task. He was led to it, he tells us in his preface, by the objection taken by the Lord Chief Justice of England in 1874 to a Bill in which it was proposed to codify the law of homicide, that it was "a partial and imperfect attempt at codification," and could thus "only be productive of confusion and mischief." Upon this Sir James Stephen determined not to lay aside the subject, but to "attempt to exemplify the possibility and convenience of codifying the criminal law by performing, as a private enterprise, the work of making a digest of it which might serve as a first step towards a code," and

thus secure that the codification, when effected, should neither be partial nor incomplete. His work is accordingly in the nature of an appeal to the general public from the decision of those who have declared codification to be either altogether impossible, or so beset with difficulties that it was quixotic to take any step toward its accomplishment. So far is the author from allowing those difficulties to be insuperable that he exhibits them practically overcome; that is, he shows that the huge bulk of ill-arranged learning contained in treatises such as "Russell on Crimes" can be presented with equal exactness, and with far greater lucidity, in the form of 368 "articles," which require only the hand of the Legislature to become "sections" of an Act of Parliament, and which are in every instance so expressed that the merest novice could have little difficulty in ascertaining for himself the law applicable to the case before him, and its relation to the rest of the system. To those, in fact, who assert that codification is impossible, Sir James Stephen replies with that cogent argument known by the formula *solvitur ambulando*, and presents them with what is substantially a code.

Such an argument would seem to stand but in little need of reinforcement. If it be true, as Sir James Stephen affirms it to be, that this Digest gives "the whole of the law relating to those everyday offences which commonly occur in the administration of justice," the boon conferred on the public and the profession can hardly be overrated. At present it is not too much to say that the criminal law of the country is a sealed book to all but an initiated few who have devoted a lifetime to mastering its technicalities, reconciling its inconsistencies, sounding its depths of intricacy and confusion. Sir H. Maine has observed that the ignorance of educated Englishmen about the laws under which they live is a phenomenon at which foreigners are very much astonished; but their astonishment would cease if they became aware of the infinite masses of subtlety, obscurity, pedantry, and inconsequence, with which the subject is beset, and of the bewildering chaos into which, owing to the absence of formal and deliberate arrangement, its huge bulk has been allowed to grow. The last edition, for instance, of the standard text-book on criminal law contained 2,672 closely printed octavo pages; and Sir James Stephen mentions, as a specimen of its arrangement, that its author takes credit for having improved it by transferring to the head of General Provisions title "Pleas of Autrefois Convict and Acquit," which was in the former edition in chapter "Burglary," and title "Amendments at the Trial," formerly under title "Evidence"; at the same time "Bigamy" and "Libel" had been classed along with a treatise on "Evidence." Nor is it merely the formal arrangement of topics which is faulty; the law itself is in many instances substantially bad. Absurdities which no Legislature could enact are brought about by the application of "judge-made law" to novel and unforeseen circumstances, or remain undetected in the tangled thicket of conflicting enactments. A lad throws a stick at a chicken, meaning to steal it, and by accident kills some one; he has, the law gravely informs us, committed murder; a man picks up a ten-pound note, not knowing whose it is and having no reason to believe that the owner could be found; half an hour afterwards he discovers the owner; he then proceeds to convert it to his own use, and can do so, says the English law, without committing an offence. A thief, by pretending to be a plumber's man, gets leave to carry away the lead pipes from a house, and disposes of them as old lead to a receiver of stolen goods; he has no doubt obtained the pipes by a false pretence, but he will go scatheless because such things were not the subject of larceny at common law, and to such things only does the statute apply. A man, his wife, and their daughter commit a crime together; the wife is presumed to act under the husband's coercion and is excused by it; the daughter, though she is proved to have acted under the most stringent coercion, is not excused at all. No one approves of these and similar disfigurements of the law; no one would have originally enacted them; but they are brought about by the agency of successive generations of judges, none of whom are personally responsible for the law which they declare, but who work out to an unreasonable result principles the unreasonableness of which escaped notice till some special combination of facts brought it to light. It is not the least merit of works such as the present that in the clear, dry light which they throw on the subject blemishes of this kind are at once detected, and can be removed without danger or inconvenience.

The material out of which the Digest has been elaborated is twofold. One half consists of the common law expressed in judicial decisions, the other half of statutory enactments; and of this half a moiety is composed of the five Consolidation Acts of 1861, in which the law on the subjects of larceny, malicious mischief, forgery, coinage, and offences against the person is reduced to a more or less completely codified form. The success which has attended this experiment ought to encourage those who desire to carry out a similar process upon the entire law. During the sixteen years which have elapsed since the passing of those five Acts less than thirty decisions have been given on their meaning by the Court for Crown Cases Reserved, and the points involved in some of these were of infinitesimal importance. These enactments, however, though substantially correct, leave much to be desired in the way of style and arrangement. They assume the existence of a large body of unwritten law and are unintelligible without reference to the theories and doctrines on which that unwritten law proceeds. Thus to any but a highly instructed student they are often fragmentary and often obscure. In many instances they repeat

* *A Digest of the Criminal Law (Crimes and Punishments)*. By Sir James F. Stephen, K.C.B., Q.C. London: Macmillan. 1877.

language of prior enactments which experience has shown to stand sorely in need of judicial interpretation and generally the wording belongs to that uncomfortable epoch of Parliamentary diction when full stops were not sanctioned by law, and when the sections of Acts consisted of single sentences of enormous length, "drawn up, not with a view to communicating information easily to the reader, but to preventing a person, bent upon doing so, from wilfully misunderstanding them." Sir James Stephen points out numerous devices, with which his experience as a draftsman has familiarized him, by which this excessive length and consequent obscurity may be avoided; and the result of his system, as shown in the articles in which statutes are embodied, entitles him to the gratitude of all those whose business it is, whether as students, practitioners, or judges, to make themselves acquainted with the law. There is no reason, he says, in the nature of things why Acts of Parliament should be dressed in so shocking a garb as that which tradition assigns to them:—

Precision and explicit statement are so far from being irreconcilable with liveliness and perspicuity of style that they render those qualities doubly valuable. If you have to state a mass of uninteresting details, and if you wish to make them as little repulsive as possible, the least you can do is to put the nominative case near to the verb, to put the rule first and the exceptions afterwards, and to avoid saying the same thing over more than once when there is no real necessity for doing so. The subject must be dull, but the style may be lively. Each word may add to the sense, and may be put in the right place, whether the subject in hand is *Paradise Lost* or the Statute of Frauds.

A careful examination of the articles of the present volume in which Acts are embodied has convinced us that Sir J. Stephen promises no more than he can perform, and that the import of a statute when expressed by him is as precisely conveyed as by the old diffuse method; while, for the purposes of rapid apprehension and subsequent retention in the memory, the advantage is enormously on the side of the novel method. It seems almost profane to say so, but we feel sure that any person of ordinary intelligence who had never looked into a law-book in his life might, by a few days' careful study of this volume, obtain a more accurate understanding of the criminal law, a more perfect conception of its different bearings, a more thorough and intelligent insight into its snares and pitfalls, than many a practitioner can boast of after years of study of the ordinary text-books and practical experience of the Courts, unassisted by any competent guide.

Our limits forbid us to follow Sir James Stephen through the brief but highly interesting notes which supplement the Digest, and explain several topics which could not be adequately elucidated in the text. The subjects of offences against the person, culminating in murder, offences against property, theft, embezzlement, obtaining goods on false pretences, &c., and the cognate topic of "possession," are discussed with a thoroughness, fulness, and masterly lucidity which are the result of a powerful intellect brought to bear with undiluting determination on the subject in hand, until all extraneous matter is got rid of, and all unnecessary confusion cleared away. We can well understand the author's admission of the "untold labour" that some passages in the work have cost him. To sift inaccurate language for the precise meaning which it is intended to convey, to trace a lurking fallacy through the manifold specious forms under which it takes refuge, to reconcile expressions which are really harmonious, though apparently conflicting, or to distinguish those which, though apparently similar, are essentially opposed; to seize the true *ratio decidendi* in rulings where the ruling authority has sometimes only partially perceived it, or, having perceived it, has set it out inadequately or inaccurately—these are intellectual processes which only an able and vigorous intellect can perform at all, and then only with an expenditure of labour and patience of which less indefatigable workers can scarcely form a conception. There are articles in this work which must, we are sure, be the result of weeks of toil; arrangements of topics so obvious, so natural, so intelligible, phrases and expressions so felicitously clear, that one is tempted to overlook the forging, hammering, and polishing by which such bright, clear-cut metal is produced, and to imagine that it is in the natural order of things that the subject should be as we see it before us, with sharply defined edges, glittering surface, and stripped of all foreign or extraneous matter. But those who know how such results are brought about, how with the draftsman, as much as with any other artificer, the *ars celare artem* is a main principle, will be in no danger of underrating Sir James Stephen's services to the literature and the law of his country in the Digest now before us. It is not too much to say that he has rescued a great topic from a limbo of confusion and obscurity in which it was little creditable to the legal profession, and to those great authorities who preside with so much dignity over the legal interests of the nation, that it should have been so long left. The state of our English law as regards informality has long been little short of scandalous; it is, in fact, a scandal that no man should be able to know for certain what the penal law is, what technically constitutes an offence, or what subtlety or technicality may in any instance defeat the course of justice. This state of things no longer exists, and has for the future, thanks to Sir James Stephen's labours, become impossible. We should hope that the Government will not let pass this excellent opportunity of codifying an important branch of the law. The present Digest, if one or two troublesome topics—such, for instance, as the obsolete laws as to religion—were left aside, might in a few weeks' time be prepared for introduction as a Bill into the House of Commons, and the subject is so cleared of obscurity that such a Bill might well be submitted to a Parliamentary Committee, and eventually to the verdict

of Parliament. But, whatever be the fate of the Digest, its effect in clearing up one of the most dusty and gloomy chambers in our legal palace is already achieved. We know exactly how we stand; which points of the law are bad, which doubtful, which confused; the whole wild region is mapped out and systematically surveyed; and nothing now remains but for the Government to give formal expression to the ideas embodied in Sir James Stephen's labours, and to secure for us the inestimable advantage of a Penal Code, intelligible to all, concise and lucid in expression, rational in arrangement, free from technicalities and subtleties, and in every respect worthy of a great nation.

MARSHALL'S HISTORY OF FRANCE.*

IT is always difficult to pass judgment on an adaptation. Whether a work be original, translated, or "adapted," it must of course stand on its own merits, and be judged accordingly. But we are hampered by a feeling of uncertainty as to the lawful recipient of the praise or blame which the work may deserve. There is a lack of "ministerial responsibility," and if there is anything wrong we do not know whether the original author or the adapter is the proper person to hang for it. Mrs. Marshall tells us that her history, "so far as the narrative is concerned, is partially founded on that of M. Lamoignon Fleury, which in its original language has been found for the last thirty years to have the power of interesting young readers," and that "the latter part of the book, from the Reformation to the present time, has been re-written, a concluding chapter added, and the whole carefully revised, by an able and experienced scholar." We are not quite clear whether Mrs. Marshall means us to understand, as her punctuation would in strictness imply, that the "able and experienced scholar" is answerable for re-writing the whole of the post-Reformation period, or only for the concluding chapter and the general revision; but at any rate it is clear that we have to deal with what is in fact the work of three hands. Notwithstanding all this re-writing and revision, there remains about the narrative a certain sprightliness and absence of prosiness which betrays its French origin. It is useless to ask why it is that a French work of any kind, a popular history, a story in the *feuilleton* of a newspaper, is so much superior in point of composition to any English production of the same class. The "twenty-six illustrations," vignettes in the spirited and unlaboured French style of woodcuts, are in like manner above the average of English book-illustration, and make us blush for the wooden figures and confused scratchy shading too often presented to us as great efforts of art. The vignettes before us are never glaringly bad, though they may sometimes be open to criticism. Exception may, for example, be taken to the picture of Clotilda bewailing her murdered grandchildren, the older of whom must have been at least nine feet high when living. On the other hand, we may notice the animated figure of Jeanne Hachette cutting down a Burgundian soldier with right good-will, and the picture of Richelieu at La Rochelle, where there is a fine effect of sea-breeze imperilling the attendant cavaliers' befeathered hats. Realistic critics may perhaps suggest a doubt whether St. Louis, though not always the most prudent of men, would have been mad enough to ride bare-headed under an Eastern sun; but, as some compensation, the artist has had the courage to represent Joan of Arc with the short-cut hair demanded by historical truth. Enough, however, of the pictures, and let us turn to the more serious study of the text.

The opening chapter, if it might be better, might also be worse. There is a good account of the rivers of Gaul, given in a clear manner which is likely to impress them upon a child's mind; and when we read that the conquest of Gaul "placed under the dominion of Rome the large provinces which are now included in the country we know as France," we see that the author has avoided the common error of speaking as if Gaul were only another name for France. But when a few lines lower down we find that Gaul "included many provinces which are now no longer part of France," we trace a leaning to the dangerous doctrine that, if France is not continuous with Gaul, it is only because some unjust fate has bereft her of her lawful property. So it is misleading, to talk of Lyons as "one of the oldest commercial cities of France." The child who thus at the very beginning of his French history finds Lyons reckoned as a city of France will be woefully puzzled when in after days he discovers that Lyons was a free Imperial city, only annexed to France in the fourteenth century. Still, on the whole, the political geography of the book is above the usual standard. Chlodwig's Franks are properly located north of the Loire, and the young reader is warned against considering Chlodwig himself as "the first King of France"; though, by the way, there is a still more doubtful claimant of the honour—that hazy personage, Pharamond, who, in the penny pictures blazoned with red, blue, and gold, which Epinal sends forth for the amusement and instruction of French children, figures as "premier roi de France." Hugh Capet's position as a true Frenchman; and the small extent of his immediate dominions, are well brought out; though the statement that he "was called to occupy the throne of Charlemagne" is too much in the Napoleonic style of history. The Parisian Hugh was unknown alike at Aachen and at Rome. Nor is the process by which France extended its boundaries marked with sufficient clearness. We quite admit that children should not be tormented by attempts to make them remember every petty

* *A History of France, adapted from the French for the Use of English Children.* By Emma Marshall, Author of "Life's Aftermath," &c. With Twenty-six Illustrations. London: Seeley & Co. 1877.

accession of territory; but still the main stages of the nation's growth ought to be chronicled. Such salient points, for example, as the annexation of Lyons by Philip the Fair, of Metz, Toul, and Verdun by Henry II., and of Strasbourg by Louis XIV., ought not to be omitted from any French history, however slight. So, too, the acquisition of the greater part of Aquitaine in the fourteenth century should have received some more definite notice than the vague statement that "the disasters of Crécy and Poitiers were almost entirely retrieved." If it was too much for the original French author's feelings to mention that Henry V. of England was acknowledged by a solemn treaty as the heir of the French throne, and that Henry VI. was crowned at Paris, it was the English "adapter's" duty to supply the deficiency. There is, to be sure, something charmingly English about this calm ignoring of one's own countrymen. Supposing that our Henry V. had been a German prince, what German writing the history of France would ever have made such omissions? Nor can we forgive an English writer the absurdity of talking about the Peninsular War as developed out of "a trifling and almost accidental expedition of some English troops to Portugal." We know our own shortcomings as a nation, and that, if we ever succeed in doing the right thing, it is more by good luck than good management. Like Miss Kenwig, we aren't proud, because it's sinful; but still, even at the expense of our humility, we must say that we did not stumble into the Peninsula by accident. On the contrary, the opportunity afforded by the Spanish uprising was seized with full consciousness of its importance. From the Opposition benches Sheridan exclaimed in well-known words, "Never before has so happy an opportunity existed for Great Britain to strike a bold stroke for the rescue of the world. Hitherto Bonaparte has run a victorious race, because he has contended with princes without dignity, Ministers without wisdom, or people without patriotism; he had yet to learn what it was to combat a people who were animated with one spirit against him." Canning, speaking for the Government, announced that they had "the strongest disposition" "to afford every practicable aid in a contest so magnanimous"; and accordingly money and supplies were at once poured lavishly into the Peninsula. That Napoleon had seized on Spain and Portugal, and that the people were up in arms against him, are facts passed over in silence in Mrs. Marshall's narrative, from which it is impossible to learn what took the English to Portugal, or how their going there affected the French Emperor. Even the dates are inaccurate, the expedition being said to have been sent out in 1807, instead of 1808, and Wellington to have driven the last French regiment across the Pyrenees in 1812, instead of 1813. Louis XVI.'s attempted flight from France is said to have been stopped at Sainte-Menehould, instead of at Varennes; and it is added that as soon as the news of the King's arrest and captivity reached Germany, a large force commanded by the Duke of Brunswick was despatched to France. We need hardly remind our readers that more than a year elapsed between the arrest at Varennes and the invasion under the Duke of Brunswick. The summoning of the States-General in 1789 is accompanied by the information that they had been "suspended since the year 1560." Any one who undertakes to write the history of France might be expected to know that there was a meeting of the States-General in 1614. To come to more recent events, Mrs. Marshall falls into the common error of fancying that the *coup d'état*, which is spoken of in the mildest terms, was immediately followed by the Empire. By a similar error, Victor Emmanuel is made to take the title of King of Italy immediately after the peace of Villafranca in 1859. It was not, as many will doubtless remember, until after the overthrow of the King of Naples by Garibaldi, that the title of King of Italy was assumed. Perhaps, however, the most amazing thing in the book is a piece of philology contained in the first chapter:—

At last the only thing left of the barbarous Celtic times was the Gallic language, and this, which spread with remarkable rapidity amongst the nations which had submitted to the Roman power, after taking up into itself a number of Celtic words, and undergoing some other changes, has formed the French language as it is now spoken.

The "able and experienced scholar" must certainly have nodded over his task of revision when he let pass the statement that the modern French language was formed from the ancient Gallic language. There has evidently been some confusion between Gallic and Latin, due perhaps to careless abridgment of the original narrative; for the statement as it stands is not only absurd, but also irreconcilable with the account of the growth of the French language given further on. Among minor points we may notice that the fine phrases of "All is lost but honour," and "Open your gates to the fortune of France," put into the mouths of Francis I. and Philip VI. respectively, have both been rejected by modern criticism.

It will be seen that there is room for improvement in this work; but nevertheless it cannot be denied a certain amount of merit. It is at any rate pleasant reading, and its bright and simple style forms a refreshing contrast to the "disgusting dryness"—to borrow an expression from Burnet—or the affected babyishness of many of our new school histories. As far as it goes, it gives a vivid idea of French history, without overloading the youthful memory with needless details. Moreover, it has the merit—which it possesses in common with most histories of French origin—of bringing out with a few slight touches the condition of the people, without neglecting the personal and picturesque incidents, the royal and military element which children—and grown people likewise, if they durst confess it—always enjoy.

HIS SECOND WIFE.*

THE ideal virtues are doubtless very admirable, but the ability to learn wisdom by experience is of as much importance; and common sense is almost more necessary for the successful conduct of affairs than saintly purity or heroic self-devotion. Evidently, however, Mrs. Eiloart does not think so, else she would not have made her heroine Pauline (or Lina) Lynton so much of a goose as well as so much of a saint. For, after all, what can be said of a woman who cannot see through the poverty and baseness of her lover's nature, even when shown it in the strongest light and under the ugliest forms, but who goes on loving him as devotedly as ever, after he has abandoned her in the worst way and at the most trying moment, and has made himself decorously miserable in a marriage with a moneyed "animal"? We cannot characterize Lina Lynton's love for Hartley Bertram, as bachelor, Benedict, and widower alike, as the passion which else it might have been called, because she is a saint, and saints do not have passions; we can only call it folly. Mrs. Eiloart prefers "idealization," and sets herself to eulogize an amount of constancy which is both abnormal and unhealthy. The self-deceiving love of a romantic young girl without knowledge or experience for a man unworthy of her is natural enough, and beautiful as well as pitiful; and that such love should continue through life, if the lovers have been separated by death or by the tyranny of adverse circumstances, so that the miserable truth is never shown, is also natural; but that it should survive after such an exhibition of cowardice and baseness as is made to Pauline is not natural, if we are to grant the possession of ordinary reason or penetration.

The cardinal fault of *His Second Wife* is its moral exaggeration. All the characters are daubed in with too "juicy" a brush, and in too crude colours. There is no fine shading, no subtle mingling of good impulses and bad, of substantial virtues and minor frailties, or even of undeniable faults and somewhat redeeming qualities. Every one is either snow-white or coal-black; shining like polished silver, or rusty as old iron. Lina Lynton is absolute perfection. She has not a fault in mind or body. She is pure, self-possessed, unselfish, devoted, unsuspicious, industrious, forgiving, orderly, and loving; she has beautiful hair, eyes, teeth, lips, neck, ears, and skin; she is small and slight, her hands and feet are perfect, and her figure, "without giving the slightest threat of over-exuberance in after life, is as rounded as a girl's of seventeen should be." With the beauty of a goddess, and the moral nature of an angel, we can but wonder that young Hartley Bertram should hold her so loosely as to break off his engagement with her because, compelled by the usages of society, she has danced with a man of whom he fancies himself jealous. And the odd part of it is that, so far as we can make out, he is offended on the very night whereon he has made his offer and been accepted. He quarrels with Lina the next day, parts from her in sullen displeasure, and finally breaks off the engagement in less than a week after it has been made; but all the while the whole world knows of it, and Lina's mother forms her plans, which are spoken of as if they had been based on some months' consideration of events. Hartley and Dr. James Wearelett each make Lina an offer on the night of her first ball; but because she dances with the young doctor, when she could scarcely do anything else, after she has refused him and accepted Hartley, and adds to this the iniquity of dancing also with Mr. Noel Treville, whom she had no reason whatever to refuse, Hartley quarrels with her, and in a very few days' time breaks off the engagement altogether. Surely the author has made a slip here. If she had taken the precaution of reducing her facts into figures and balancing her sum afterwards, she would have seen the chronological impossibilities of her narrative.

This Hartley Bertram, Pauline's idol, is a very shaky divinity. He is handsome, and with a surface kind of amiability that goes no deeper than manner; and when these two qualities are given all is told. For the rest he is weak and jealous, selfish and vain, self-indulgent and inconstant, the shallowest thing all through on which a girl could cast the priceless treasure of her love. But Lina loves him alike in the beginning and at the end; and, though she lives his unappreciated martyr and dies substantially of his cruelty, she dies still as much in love with him as ever, if perhaps a little less blindly than heretofore. Take Dr. James Wearelett, again, as a specimen of the author's skill in character-painting. He is without a redeeming trait, physical or mental, a creature "born old," looking "like a fairy changeling in his nurse's arms," though for this we can scarcely think the creature itself to blame, and should have felt more inclined to pity the poor little wretch than to make its sickness its crime. He had been a quiet boy, which also excites the author's wrath, "never broken a window, thrashed another boy, flung stones, torn his trousers, lost his books," or troubled his mother; but he had dabbled in chemistry, kept himself clean, and dissected small birds and butterflies. By implication we find that, as a medical student, he was a vivisectionist and a materialist. But, more than this, he was bitter, spiteful, unforgiving, and selfish in a manner and on occasions which may safely be pronounced impossible in a doctor who loved his profession as he is said to do. But Mrs. Eiloart is a writer who generally either loves or hates her own creations, and who consequently is partial or unjust in the treatment of them. Noel Treville is another young gentleman for

* *His Second Wife*. By Mrs. Eiloart, Author of "The Curate's Discipline," "Jabez Ebsleigh, M.P.," &c. 3 vols. London: Samuel Tinsley, 1877.

whom she has mixed her palette in monochrome of a sombre and unlovely tint. Just as Dr. James Wearelett's hair "began to grow bald at the crown" when he was only twenty, so at twenty-two young Mr. Treville shows "signs of wear and tear round the eyes and in the corners of the temples." He falls in love with Lina at this famous ball where Dr. Wearelett has been rejected and Hartley Bertram accepted, and where apparently every one in the room knows how things stand between them. James Wearelett, who wishes to spoil for another what he cannot enjoy himself, gives Hartley a look while Lina is dancing with Mr. Treville which the author describes as "all done in an instant; but there was no deadlier poison in all the drugs his father's surgery hold than that look conveyed to Lina's lover." How he knew that Hartley was Lina's lover remains the author's secret, just as it is her secret how Hartley's father knew it the next morning, and how Mrs. Lynton would have speculated on the marriage many pages before the real story opens. This Mr. Noel Treville is, as was said, only two-and-twenty, but is already a young man of morals so debauched and experience so varied as to know that, if he succeeded in seducing Lina, he "should soon weary of her if he saw her too often; that he had outlived love, and exhausted passion; and that, if that pure and faultless beauty were to be his own, he should very soon prize it no more than a camellia that had faded in his button-hole." No wonder that, in a fit of moralizing, the author says of this promising young gentleman, for whose existence she alone is responsible, "But the oldest thing in all Waterhurst, to my thinking, was Noel Treville"; or that his hair was "thinning at the temples," though we are glad to learn that it was "still wavy and glossy." This "fallen god," as he is somewhere called, is the evil genius of Lina's history; but he loves her, for him sincerely, though he does at the end degrade the perfect purity which had been her enduring charm for him by making love to her in the conservatory of his own house, where she and her husband are his guests, she being a married woman of thirty-five or so. He finishes by eloping with Isabel, Lina's step-daughter, and Bertram's daughter; or rather letting her elope with him, though he is still as passionately in love as ever with Lina. However, in this unsavoury little episode he is almost more sinned against than sinning, and more deserving of pity than of shame for the love which he has inspired in Isabel Bertram.

Here again comes in Mrs. Elcort's injustice towards her own characters. Isabel is simply a revolting caricature of an undisciplined and strong-natured girl. She is an ill-tempered, violent, and sensual "animal," like her mother before her. She is a gross and coarsely-painted exaggeration throughout, reminding us of Mrs. Henry Wood's work by the unnecessary introduction of ugly and commonplace details, such as Isabel's idleness—proved by her love of French novels, and the "crotchet antimacassar" which "fell to pieces through sheer dirt before it was half finished;" which by the way is unmitigated nonsense, like very much more in *His Second Wife*. Isabel's hatred of Lina too, as the saintly and all-suffering stepmother, is as exaggerated and unnatural as the rest; and the scene of the child's death is both silly and impossible. Human beings in their sober senses are not monsters, and Isabel is made undeniably a monster. Her very love for Noel, where the author might have shown some kind of sympathy and tenderness, is drawn in the same coarse and cruel manner as the rest; and the saintly Lina's action during the elopement is as unbusiness-like as Isabel's is shameless. Hartley, too, is a mere caricature of a man, and his want of principle and want of common sense together are more than even the most indulgent reader can accept. Not one of the chief characters is endurable; and even the old grandfather, in whom there is more attempt at light and shade than in the rest, is, on the whole, odious.

Altogether the story is weak. It is disfigured by foolish little digs at men and the estimation in which they hold women; by silly little allusions to women's rights, and the wrong done to the sex by supposing that part of their life's duties is to keep their husbands' houses when they are wives, and take care of their children when they are mothers. The picture of country life which it presents is, to say the least of it, queer; and even twenty years ago we think that anyone would be hard put to it to find a country doctor on six hundred a year, and a country lawyer on a thousand, who would speak of a wealthy tea-broker as a "grocer," and hold themselves superior to merchant princes living in their grandest houses, because these had been in trade and they themselves had not. Country lawyers and doctors in such a place as Waterhurst do not rank so very high themselves that they can afford to despise wealthy merchants of refined manners and cultivated minds because of the degrading element of "trade." Nor do we think that such a man as Noel Treville is described to be could be found at the age of twenty-two; or that a high-minded and heroic girl like Pauline would have suffered herself to have gone on consciously loving a man who had behaved so ill to her as Hartley Bertram had done—more especially after he had married another woman; or that she would have been so foolish and weak after her own marriage as not to know how to be mistress in her house; or that such a girl as Isabel is a pleasant or profitable portrait anyhow. We are by no means afraid of truth, nor are we of those who wish to see human nature always painted in rose colour; but neither do we like to see a caricature offered for a faithful portrait, or a work of art scrawled off with the crude passion and injustice of a partisan.

GERMAN LITERATURE.

A BOOK by Marshal von Moltke* would be sure of readers, even if it had no relation to the absorbing question of the day. The references to the military resources of Russia in the Marshal's private correspondence of twenty years ago are not, indeed, very numerous, nor do they enter very deeply into the subject; they nevertheless serve in a general way to indicate how Russia appeared in 1856 to one of the most competent of observers, and to suggest what the first of living authorities probably thinks about her now. We should infer that Count von Moltke's respect for the power of Russia was not inconsiderable, and that he would augur favourably of her ability to accomplish the enterprise on which she is at present engaged. At the same time we can hardly doubt that he thinks she would have done better to have remained at peace. Civilization is in his eyes the great want of the country; he can only feel assured of the great future of which he asserts her to be capable upon condition of the gulf between the upper classes and the bulk of the people being filled up, and the latter thoroughly leavened with Western ideas. The task, he thinks, is gigantic; to convert the Russian Church alone into a civilizing agency might well require a century. It says much for Count von Moltke's superiority of understanding that problems of this nature should have occupied his attention in preference to the professional details by which he might have been expected to have been engrossed. His observations on Russian church architecture and other interesting points outside of his own profession similarly attest the wide range of his interests and knowledge. Written on the occasion of a coronation, and addressed to a lady, these letters naturally contain descriptions of ceremonial and of the appearance of Court personages of comparatively slight interest. Their real importance consists less in what is actually said than in the general impression produced upon the writer's mind. This we should take to be that Russia is a great Power in the making, and that the realization of her ambition depends upon her ability to penetrate her masses with Western culture without impairing that unity of feeling among them which constitutes her peculiar strength. So formidable would she be in such a case that, according to his view, any premature exertion of her force such as she is now attempting may well prove in the long run a benefit to Europe. It will of course be remembered that at the date of these letters the relations of Russia and Prussia were very cordial.

The publication of the memoirs of the late President von Schön†, a statesman intimately connected with Baron von Stein, has called forth a lively discussion on the merits and character of the latter. Schön's efforts to disparage him have led to his own character for veracity being impugned by those who have been accustomed to regard Stein's fame as a precious national possession. The controversy turns largely on a diary of Schön's of the year 1813, which certainly seems to betray a quarrelsome and censorious spirit.

Dr. Blochwitz's‡ summary of Turkish history is concise and impartial, with no especial literary pretensions. It concludes appropriately with a note of interrogation.

The recent success of the Socialist party in the Berlin elections is regarded on all sides as one of the most remarkable signs of the times, and as by no means a reassuring one. While the Ultramontane party show their readiness to convert a public calamity to their own purposes, a Protestant clergyman§ comes forward with an earnest and well-intentioned effort to reconcile capitalists and socialists on the basis of a common acceptance of what he regards as the teaching of the New Testament. We are familiar with such endeavours here under the title of "Christian Socialism," and it need not be said that their practical effect has been but inconsiderable. Self-interest—often ill understood—has always turned the scale in the last resort; it is equally difficult to convince one party that the New Testament goes so far, and the other that it goes no further. It is to be hoped rather than expected that the writer may succeed in inspiring some portion of his audience with his own love of truth and equity. His sympathies are strongly in favour of the Socialists, whose faults he regards as principally provoked by the unfeeling egotism which he rightly or wrongly attributes to the wealthier classes in Germany. He considers their theories, indeed, as irrefutable from the point of view of political economy; the right way of meeting them, according to him, is to demonstrate the fallacy of expecting any considerable social amelioration to ensue from them, were they even carried into effect. The book is chiefly valuable as an exposition of the real scope of the Socialist movement in Germany by one who is neither partisan nor adversary.

"Democracy," by Julius Schvarcz||, is a somewhat indigestible treatise, which may perhaps be best defined as an attempt to base politics upon anthropology. The first part illustrates the author's method from the history of the Athenian Republic.

A biography of Richard Wagner, by C. F. Glasenapp*, originally published with a view to the Bayreuth Festival of last year, may be recommended to the notice of those English readers whom the composer's visit to this country has inspired with curiosity respecting him. It is, indeed, very imperfect in matters of detail, and evidently destitute of any authority at first hand. The writer admits, for example, that he does not know whether Herr Wagner actually bore arms in the Dresden insurrection of 1849 or not. It is also, as indeed any biography written under such circumstances is sure to be, the work of a thoroughgoing admirer and indiscriminate panegyrist. It possesses, nevertheless, the great merit of not being unduly technical, and of setting forth the incidents of a musician's life in diction for the most part perfectly intelligible to non-musical readers. Herr Wagner's career, it need not be said, has been singularly interesting and eventful. Pride and self-assertion appear as its mainspring even in the biographer's partial pages; it is not unamusing to reflect how different its course might have been, and how peculiar a type of musical character the world might have lost, had not his inaptitude for the style he originally attempted prescribed to him a *flectere si nequeo superos* line of action. The first volume concludes with the performance of the *Tannhäuser* at Vienna in 1859.

Countess Nostitz†, the widow of the traveller Helfer, who died in the East India Company's service about 1840, publishes, by way of supplement to his travels, an account of her own adventures since his death. These include the fortunes of her deceased husband's plantation in British Burmah, which had eventually to be given up; some pages of Egyptian travel; a residence at the Prussian Court, and in Bunson's family in London; ultimately an agricultural experiment in the Banat, the climate of which district proved too trying for a resident inured to every kind of hardship in the tropics.

The author of an interesting volume of travel in Phœnicia, Herr Prutz‡, whose attention has always been directed rather to the mediæval than the classical archæology of Syria, publishes a valuable memoir on the possessions of the Teutonic Knights in the Holy Land. He investigates the locality of the various fiefs and lordships possessed by the Order, and the amount of the revenue derived from these and other sources of income. This is shown to have been very considerable, and the administration of the Knights appears to have been distinguished by great practical ability.

We are much indebted to J. G. Kohl§ for his interesting monograph on the exploration of the Straits of Magellan, from their original discovery down to the pending projects of the Chilean Government for their partial colonization and the erection of light-houses. Should these be realized, the Straits may possibly become a commercial highway, which they have never been hitherto. Herr Kohl publishes a curious German map, illustrative of the notions respecting America and the Indies current in the days of Magellan, and of the geographical importance of his discovery. He shows how the ardour of research in this quarter abated after Magellan, partly from the discovery that the Moluccas were more accessible from the Mexican coast, and partly from the jealous policy of Spain, which went to the length of denying the existence of the Straits altogether. Drake's enterprise exposed the deceit; and Spain, finding that the existence of the passage could no longer be concealed, endeavoured to occupy it effectually by expeditions under Admiral Sarmiento. Sarmiento's attempts at colonization proved most unfortunate; but his exploration of the Straits was exceedingly thorough, and he deserves to be regarded as their second discoverer. The best modern authorities are the English navigators Fitzroy and King, whose *Voyage of the "Adventurer" and "Beagle"* is the grand repertory of information respecting the southernmost part of the American continent.

Dr. H. Magnus||, a scientific oculist, publishes an ingenious little essay, partly founded on the philological researches of Geiger, on the gradual development of the perception of colour during the historical period. The vagueness of Homer's epithets derived from colour has frequently attracted the notice of commentators; and Dr. Magnus, or rather Geiger, ingeniously compares such apparent eccentricities as his description of Ulysses's locks as "hyacinthine" with the absence of blue as an epithet of heaven from the Vedas, to prove that neither the Greek nor the Indian bard could distinguish blue from black. It follows, he considers, that further refinements in the sense of vision may be expected, and that the eyes of our posterity may be educated to discern a variety of tints where all is uniformity to us.

The third volume of the excellent series of Swiss lectures¶ delivered at Basel under the auspices of E. Desor and other professors includes a wide range of subjects, from the spectroscopic

analysis of the sun to the music of Mendelssohn. The most remarkable is perhaps one by Carl Vogt on volcanoes, vigorously contesting the current belief in the internal heat of the earth.

Herr Braun-Wiesbaden's* miscellanies are correctly described by the author as feuilletons. They are, indeed, hardly of sufficient importance to deserve reprinting. The best are studies of political characters, especially of personages connected with the revolutionary movement in Baden, such as Karl Mathy and Friedrich Hecker.

Vilmar's standard history of German literature† appears in a new edition, carefully revised by K. Goedeke, and accompanied by an appendix of notes and bibliographical particulars which contribute much to remedy the parsimony of detail conspicuous in the original work. Vilmar's want of sympathy with the modern spirit renders his work, with all its merits, an inadequate guide to the more recent development of German literature.

An essay on the relation of the Norse Niflunga Saga to the German Nibelungen Lied, by A. Raszmann‡, is directed to prove that the former is derived neither from the Nibelungen Lied nor the Edda, but from the combination of a North German cycle of tradition, from which the Eddaic version is mainly derived, with the South German traditions which originated the Nibelungen. This theory is supported by a comparison of Icelandic and German texts, intended to establish the derivation of the former from the latter.

Although as yet less known than his contemporary Björnson, Henrik Ibsen, the Norwegian poet, is rapidly obtaining a European reputation. The translation of his remarkable dramatic poem *Brand* § now before us is the third that has been made in Germany. In its general conception *Brand* bears a considerable resemblance to the late Mr. Dobell's *Balder*, the subject being in each case the sacrifice of the domestic affections in a visionary pursuit. *Brand*, however, is a more interesting character than *Balder*, in so far as he sacrifices his wife and child in fancied obedience to the will of Heaven, instead of at the prompting of his own selfish egotism. The piece, moreover, is no example of "the spasmodic school," but a carefully constructed drama, and the diction is entirely exempt from *Balder's* tenuity and extravagance. On the other hand, it is singularly deficient in poetical beauty, apart from its uniform nervous energy and dramatic propriety. The character of *Brand*—the preacher of righteousness almost bereaved of human attributes by his intense absorption in his mission—is powerful and by no means unnatural; but his barbarous and revolting conduct, however logically derived from his premises, excludes him from our sympathy in a degree fatal to dramatic effect. As a subordinate figure he would have been most telling. The other personages, though merely auxiliary, are well drawn; there is considerable *vis comica* in the decorous bishop and the shrewd Philistine magistrate. The translation appears to be elegant and spirited. The drama is written throughout in octosyllabic rhyme, and must in the original be a most remarkable example of metrical vigour and flexibility.

The new part of Carl Engel's edition of the old German puppet plays|| contains *Christopher Wagner* and *Autrascheck and Juratscheck*. The former is a kind of appendix to *Dr. Faustus*, and might almost pass for a parody upon it, although such was by no means the intention of the writer. It is incomplete, owing to the imperfection of the original MS.; but, if it adhered to the original chap-book, the catastrophe would have been tragical. The other piece is a Transylvanian robber-story.

The first series of Sacher-Masoch's "Bequest of Cain"¶ dealt with the relations of the sexes. The author presented himself in the light of a constructive reformer, destroying in order to rebuild. In so doing he inevitably exposed himself to censure on the ground of the tendency of his writings—censure which was unreasonable in so far as regarded his criticism of mere conventionalities, but well founded as concerned the coarseness of some of his descriptions and the repulsiveness of some of his situations. In his second series he is on less delicate ground, although his disparagement of the institution of property is likely to bring attacks upon him from a different quarter. The general drift of his stories is to represent this institution as a merely transitional and provisional circumstance in human society. However visionary and mischievous such speculations may appear, it is to be borne in mind that Masoch, as an Austrian Pole, is a representative of the traditional Slavonic view of the question, whose tales possess serious interest as illustrations of modes of thought with which we have recently become acquainted through the works of Mr. Wallace and similar writers. an æsthetic point of view they are highly to be commended for their clear energetic diction and general interest of plot; though we cannot concede to them either the philosophic or the artistic significance claimed for them by the author in a disquisition which would have come with better grace from his critics.

*Haus an Haus** and *Verfälschte Liebe*† are two pretty novelettes, with no very distinctive features.

"Love's Fiery Trial," by Alfred Friedmann ‡, is a story in verse founded on the *Filberto* of the Italian novelist Bandello, and appropriately told in the octave stanza. The tale is effectively narrated, and the style is very polished and easy. "Angioletta," a cycle of ballads in Heine's manner, is not equally successful.

The most important contributions to the May number of the *Rundschau* § are the description of a visit to Argos and Mycenæ, a few months before the commencement of Dr. Schliemann's excavations, a hitherto unpublished diary of the unfortunate poet Lenz, detailing the history of a love affair in which he was implicated at Strasburg in 1774, and a memoir of the Russian socialist Bakunin, interesting as exhibiting the relation of the extreme Left of the Hegelian school with the revolutionists of thirty years ago.

North and South||, the new German periodical of the day, appears to aim at a somewhat more special character than the *Rundschau*, and is certainly less adapted to the tastes of readers of general culture. It is graced, however, by a splendid portrait of the composer Riehl, after an etching, and contains one paper which would have been highly interesting, had not the weight of evidence already compelled the writer to retract his conclusions. This is Curtius's celebrated discourse on Dr. Schliemann's discoveries at Mycenæ, in which he more than insinuates that they must be assigned to a medieval date. A violetto by Jensen, verses by Geibel, and a curious paper by Georg Ebers on the traces of rhyme in Egyptian poetry, may be enumerated among the other attractions of the number.

The *German Review of the Collective National Life of the Period*¶ is based on a different plan, and aims at giving a general summary of public activity in various departments. It is a useful publication for reference, but does not aspire to the literary standard of its competitors.

We have received a letter from the Rev. G. T. HUDSON, the Senior Brother of St. Katharine's Hospital, which confirms the conjecture made in our article of last week—that the newspaper reports of the funeral of the late Master were imperfect. Mr. HUDSON states that nineteen persons from the Institution, including two Brothers, the Surveyor, the Schoolmaster and Schoolmistress, and a party of scholars, attended the funeral, as representing the Hospital, and that he himself offered to take part in the funeral service, but the offer was not accepted.

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

PARIS.

Copies of the SATURDAY REVIEW may be obtained every Saturday of M. FOTHERINGHAM, 8 Rue Neuve des Capucines.

THE SATURDAY REVIEW

OF

POLITICS, LITERATURE, SCIENCE, AND ART.

Price 6d.

CONTENTS OF No. 1,125, MAY 19, 1877:

The Debate. The Crisis in France.
German Parties. Mr. Bright at Exeter Hall.
The Riddale Judgment. Politics at Whitehall. Inebriate Reformatories.
The Independence of Indian Judges. The Burial Bill in the Lords.

Some Aspects of Charity. Modern Archæology.

The Discoveries at Mycenæ. Mr. Gladstone and the Liberal Party.
The Steam Tramways Delusion. The Chapter of St. Katharine's Hospital.
Breaking the Sabbath. Scoury in the Arctic Expedition.
The Royal Academy—III.

The Life of Lord Alving. A Trip to Cashmere and Ladak.
Alfred de Musset. The Chevalier Novels. Stephen's Digest of the Criminal Law.
Marshall's History of France. His Second Wife.
German Literature.

CONTENTS OF No. 1,124, MAY 12, 1877:

Mr. Gladstone's Resolutions—The Liberal Party—The Transvaal Ammunition—Egypt—The Rules of Debate—France and Italy—The Faller Case—Manchester and Thirlmere.

Bringing Back the Mastodon County Towns—The Patronage of St. Katharine's Hospital—Modern Quakerism—The Carlton Celebration—Mr. Hargrave on Disestablishment—The Royal Academy—II—Racing at Newmarket and Chester.

Baker's Turkey in Europe—Symonds's Renaissance in Italy—John Bunce—Kamson Folk-Tales—Fallas Commentary on Catullus—Amsterdam and Venice—Shoddy—Minor Notices.

London. Published at 38 SOUTHAMPTON STREET, STRAND, W.C.

ADVERTISEMENTS.

MUSICAL UNION—PAPINI (last time this Season), with SAINI, SAENS from Paris—For the Afternoon, St. James's Hall, May 21. Quartets, Vocal and Instrumental, and Solos. Tickets 7s 6d each, to be had of Messrs. K. C. and O. IVIC, 11, B. Street, at 1. Admission at 10. Half 5s. Can pay at the Box-office entrance. Tickets sold by ELLA, Duff.

THE SOCIETY OF PAINTERS IN WATER COLOURS.—THE EIGHTH EIGHTH EXHIBITION IS NOW OPEN, 5 Pall Mall East. From Nine till Seven. Admission is Catalogue 6d. ALFRED D. FRIPP, Secretary.

DORIS GREAT WORKS, "CHRIST LEAVING THE CRUCIFIX" and "CHRIST ENTERING JERUSALEM" (the latter just completed by the artist, with a Discourse of Philip the Christian Martyr, &c. &c., at the HOLY GALLERY, 1, New Bond Street. Daily 10 to 6, &c. &c.

THE WAR.

THE Russian campaign in Europe is scarcely begun; but the elaborate preparations for crossing the Danube in overwhelming force bode no good to the Turks. The capture of Ardahan is the first success which has been attained on the Asiatic side. The same troops will probably be employed in completing the investment of Kars, which is not likely to offer a prolonged resistance. Erzeroum, which is said to be weakly fortified, will then lie open to the invader, and the Russian commander will be able to determine at leisure the course of his subsequent operations. The successful attack of the Turkish fleet and land force on Soukoum Kale is no equivalent for the loss of Ardahan and the imminent danger of Kars; but it probably took the Russians by surprise, and the attempt at insurrection in their rear may involve trouble and expense. Yet even if the whole of the Caucasus were in possession of an enemy, the Russians could maintain a communication with the army in Asia Minor by the safe, though circuitous, route of the Caspian. It seems improbable that the inhabitants of Western Circassia will respond to the invitation of the Turks, even with the aid of armed bodies of their countrymen who may be disembarked on the coast. The Russian conquest occupied many years in its progress, but it was at last complete. The mountaineers are cowed and disarmed; and all their strongholds are in possession of the conqueror. Those who wish well to the Turkish cause will deceive themselves if they rely on religious enthusiasm as a serious impediment to the progress of the invader. It is not indeed necessary to believe official reports of the eager acquiescence of the population in the establishment of Russian administration wherever the army advances; but, on the other hand, there is no symptom either in Circassia or in Asiatic Turkey of extraordinary fanatical excitement. Regular troops have little to fear from a defensive crusade. It may be assumed that the religious feelings of the conquered population will be respected, especially as the districts which may now be occupied will probably be retained as permanent additions to the Russian Empire.

The declaration of independence by Roumania had been confidently anticipated. The Government had concluded a military convention with the invader of Turkey even before war was declared, and all the resources of the Principality were placed at the disposal of Russia. The Turks, with the straightforward simplicity which often characterizes their proceedings, relieved the Roumanians of the trouble of finding a pretext for a rupture by at once treating as enemies the avowed allies of Russia. The Roumanian Government accordingly pretended to resent an attack, while they pursued without interruption their deliberate designs. Their Parliament has voted the independence of a country which cannot at present stir hand or foot without the permission of a foreign commander. It is not worth while to inquire into the justice of a policy which admits of easy expansion. Roumania has no cause of quarrel with Turkey, nor is it even united by the newfangled fiction of ethnological sympathy with the Bulgarians on the other side of the Danube. The feudal connexion with the Porte was, as long as it lasted, a kind of formal security against the more formidable dominion which is not yet established by Russia; but nominal independence may perhaps seem attractive, and Princes like to gratify the only ambition within their reach by assuming the title of

King. Prince MILAN will either follow the example of his neighbour or remain neutral, according to the orders which he may receive from the Russian headquarters. It is not improbable that there may be an understanding with Austria which may keep Serbia outside the range of hostilities. The recent history of both Principalities forms an instructive comment on the plausible theory that a barrier of petty States should be erected between Russia and Turkey. It is now evident that Servia and Roumania are merely provinces of Russia; and Bulgaria, if it is similarly constituted, will be equally dependent. The Greeks, alone among the races in the South-East of Europe, might perhaps make an effort to establish and maintain their independence. Among contradictory statements it is difficult to ascertain whether the Slavonic inhabitants of the Turkish provinces feel dislike and dread of their Russian patrons. There is no doubt that the Greeks are intelligent enough to regard with repugnance a more formidable and severer despotism than that which has been fitfully exercised by the Porte. If the Hellenic Government takes part in the war, its object will be to rescue Epirus, Thessaly, and Crete rather from the Northern invader than from the present possessor. It is true that the motives of a troublesome hostility will not concern the Turkish Government.

The old saying that law is reduced to silence by the presence of arms might advantageously be extended to party criticism. The speeches which are still from time to time delivered at Liberal meetings are obsolete as well as one-sided. Mr. GLADSTONE, indeed, will not be charged of dulness when he presides over the organization of a new Liberal party next week at Birmingham. His eloquence will, as on former occasions, be animated by enthusiasm, and no restraints of prudence will be allowed to interfere with his appeals to popular sympathy. It should be necessary to sacrifice Church and State to the memory of the Bulgarian victims, Mr. GLADSTONE will not shrink from disestablishment or from universal suffrage. His followers, and Liberals who are wavering between their former leader and Lord HARTINGTON, are not equally exempt from the risk of becoming irrelevant and tedious. The Peace Society may perhaps claim exemption from the ridicule which attaches to ordinary anti-Turkish meetings, in consideration of the unconscious humour of its complacent approval of the present state of affairs. Great satisfaction was expressed at the supposed adoption by civilized States of the device of arbitration. It was stated that the PRESIDENT of the United States approved of the measure, which has proved so remarkably advantageous to his Government. It is not understood that Russia offered to submit to arbitration the justice of a cause which is maintained by entirely different methods. The Peace Society apparently regards without either disapprobation or regret the commencement of a struggle which may prove to be prolonged and bloody. The only notice of the war contained in a series of resolutions condemning the conduct and character of the weaker belligerent. Protests against intervention to check the aggressor may perhaps be justified by the circumstances of the case; but the passive encouragement of a war of conquest scarcely becomes the advocates of peace.

The Duke of ARGYLL, and a correspondent of the Times who has answered his speech and letter, fail to make clear to ordinary understandings the real bearing of the Protocol and the Russian and English Declarations. The French in

the poem speaks of a text which no one can read, illustrated by a gloss which none can read except himself. The assembled diplomatists composed an unintelligible engagement, which was accompanied by one or two contingent forms of defiance; and the English Minister hoped that under the cloud of words the threatened war might disappear. It is not known whether the representatives of Russia were then aware of the irrevocable determination of their Government to begin the war for which long preparation had been made. When Prince GORTCHAKOFF announced in his Circular that his Government was about to execute the decision of Europe, Lord DERRY not unnaturally expressed the disappointment of his hopes as well as his repudiation of the Russian assumptions. It is a question of little interest whether, as the Duke of AEGYL holds, the English Government ought not to have been misled by documents which, interpreted by the light of later events, may perhaps indicate the real intentions of Russia. The issue would be best decided by a judge trained in the old mystery of pleading, after such an argument as was formerly held on special demurrers. The fictions and deceptions of diplomacy will be forgotten by the historian of a war which may perhaps change the face of Europe. It is not edifying to listen to intelligent speakers of the political rank of Lord F. CAVENDISH or Sir H. JAMES as they expatiate for the twentieth time on the alleged mistakes of Lord DERRY since the ancient days of the ANDRASSY Note and the Berlin Memorandum. Mr. FORSTER candidly said in the late debate that, if Lord DERRY had not done well, he was not certain that any other Minister would have done much better. The assailants of the Government now contend that Russia ought to have been held in check by officious co-operation, as a wild elephant in India is fastened between two tame ones. With England and Austria on either side, Russia would perhaps have crossed the Danube in smaller force; and it is barely possible that there might have been no campaign in Armenia. The hypothetical possibilities of the past are but idle subjects of discussion when not only peace, but national honour and safety, may at any moment be compromised.

GERMANY AND FRANCE.

PRINCE BISMARCK has come back to Berlin, and his return has fluttered the dovescots of the Continental Bourses. At Paris it was immediately taken for granted that it was the establishment of the DE BROGLIE Ministry that had brought him from his retirement. Whether he really intends to take any personal part in affairs for the present may be doubted when his very urgent need of rest is considered; and there certainly can be nothing in the mere fact that Marshal MACMAHON has thought fit to change his Ministry to make the German CHANCELLOR deny himself some more days of repose. Whatever may be the consequences to the outside world of the very remarkable crisis through which France is now passing, they cannot show themselves directly. Time may show that Germany is really interested in what is going on in France; but for the moment there is nothing for Germany to do. At the same time it may be remarked that the whole German press, with scarcely an exception, regards with apprehension the step which the MARSHAL has suddenly taken. The papers that are opposed to the existing state of things in Germany denounce the MARSHAL's proceeding, not because it is wrong, but because it is inopportune, premature, and rash. Those who like the French Republic and liberal institutions denounce what the MARSHAL has done, because they think it wrong and unprincipled. But all Germans consider that the French change of Ministry is a serious thing for Germany, and they are aware that Prince BISMARCK, whether he stays at Varzin or comes to Berlin, cannot fail to think so too. He has never been slow to point out to his countrymen the dangers that threaten them, and his views on the relations of Germany to France are so well known that no one can affect to misunderstand them. And yet it might seem as if any fear of danger to Germany from France in consequence of the new French Ministry must be very chimerical. There are two things which Germany has to fear from a French Ministry—a menace of hostilities, and the patronage of Ultramontanism. But the new French Ministry is as pacific as possible, and it is very anxious to separate itself from the extreme clerical

party. Duke DECAZES is to continue his prudent course of absolute neutrality, and assurances have been given to all foreign Powers that it is only the internal policy of France that is to be changed, and that its foreign policy will not be in any way altered. No sooner was the Ministry formed than, at the instance of General CIALDINI, a notice was posted up on the walls of the Chamber that the MARSHAL would firmly repress all Ultramontane demonstrations; and Signor DUPRETIS has informed the Italian Parliament that he is convinced that Italy has nothing to dread from the new French Ministry, and that no pressure will be brought to bear on Italy in ecclesiastical matters. Even Don CARLOS has been summarily expelled from France at the request of the Spanish Government, and Don CARLOS rivals the Count of CHAMBORD as a symbol of legitimacy and clerical ascendancy. And, what is more important, there is, as all well-informed Germans, and especially Prince BISMARCK, must know, every reason to suppose that the French Ministry is sincere. It has no wish for war, and is convinced that war would be very unpopular in France and very perilous to French interests. It also considers itself the champion of lay Conservatism. Only one of its members is openly allied with the clerical party; and, as a body, it is determined to appeal to the secular and not to the religious motives of those who it believes will rally round it. All this is true; but to a reflecting German it would show that the danger which Germany dreads is comparatively remote, not that it does not exist. The DE BROGLIE Ministry must not, he would say, be looked at merely as itself, but in connexion with the general state of France.

The friends and enemies of the new Ministry agree at least in this, that the only foundation and reason of its existence is the determination that a French Republic, in any sense which the most moderate Republicans think deserving of the name, shall not exist. France is not to govern itself, but is to be governed. But the government of the nation, as opposed to the governing of the nation by itself, is, in the present state of France, Imperialism and nothing else. The Legitimists have no power, or chance of power, or wish for power. Their function is to grumble and scorn and wrap themselves in the cloak of their own virtue. As to the Orleanists, they are utterly dead as a party. It is almost impossible to meet a Frenchman who avows himself to be an Orleanist. There are a few members of the ORLEANS family, and a few men of eminence belonging to a past generation who are popularly called Orleanists; but there are no hopes or prospects attached to the name. Bonapartism, on the other hand, is a very living and powerful reality. The family of the BONAPARTES has scarcely anything to do with Bonapartism in its real meaning, except that the party must have a head, and a Court is essential to it. Imperialism is essentially based on a certain way of looking at life which has a great hold on France. It signifies the desire of gentlemen to keep down snobs, the desire of adventurers to push themselves, the desire of those who have taste and wealth to see refinement and luxury triumphant, the desire of the timid to lead a quiet life, the desire of the busy to make money, and of the pious to see religion glorified, and the desire of Frenchmen to hear the world talk once more of the power and fame of France. The strong influence which this mode of regarding the aims of human existence exercises on French society can only be appreciated by those who, like the Germans, study a country before talking of it. Republicanism in France rests on the discordant foundations of high principle in some, and envy in others, and to Imperialists both elements are equally obnoxious. High principle is bad style, and the obvious are to be made to keep their envy to themselves by being trodden under foot. In the contest which the MARSHAL has now provoked, Imperialism and Republicanism are brought face to face, and one of the two will conquer. The Imperialists have for the moment possession of the field. Their representatives do not call themselves Imperialists; but that is a mere question of name, or at most refers to the extremely subordinate question whether they favour the restoration of the PRINCE IMPERIAL or not. But the programme of the Government is in all essential points thoroughly Imperialist. It proposes to manage elections, to let loose Imperialist prefects and sub-prefects on the departments, to call the clergy to its aid, to make all its adversaries feel that it has the army at its back, to give order instead of liberty, and to let polite society and fashionable politicians dis-

tribute the prizes of ambition. This is Imperialism pure and simple, and it makes no difference whether evening receptions are given by a lady and his mother, or by a most respectable soldier and his wife.

If the establishment of the DE BROGLIE Ministry is regarded as a question of French politics, there is much to be said as to the time and history of its origin. The contests between the MARSHAL and his Ministers, between his Ministers and the Assembly, between the Assembly and the clerical party, have all to be taken into account before justice is done to those who hope to profit and those who fear to suffer by what has taken place. But to a German the important thing is that Imperialism once more reigns, and must reign, or kiss the dust of utter defeat; and a German need not be anything of an alarmist if he thinks that Imperialism in France touches German interests very closely. French Imperialism has really no choice. However it may think it would like to be secular and peaceful, it must have the support of the clergy and the army, and it must pay the price which the clergy and the army ask for their support. LOUIS NAPOLEON was as little of a bigot as any man, and, at least towards the end of his life, he hated war; and yet, at the bidding of a clerical clique, he challenged Prussia, and went helplessly with his army to Sedan. No electioneering manoeuvres could help the Imperialists to pack a docile Assembly without the active co-operation of the priests; and no packed Assembly, however docile, could vote in the name of France unless the army was there to say that its votes must be obeyed. But the clergy will certainly not continue to support Imperialism without making a bargain, which sooner or later the Imperialists will have to carry out. The army cannot simply sit on France year after year doing nothing but repressing its fellow-citizens. It could not and would not place itself in this passive hostility to the people for more than a time which might be long or short, but which must come to an end. All experience shows that an Imperialist army must be employed. Repression must be varied by war, or the soldiers will get so sick of repression that they will not be trustworthy. This may be taken as permanently true; but it is especially true now, for France is not as yet at all frightened at the Republic, and the general feeling is that the Republic has been very harshly treated. The army would therefore be a more engine of repression, and would not be sustained by that feeling of union with popular sentiment which incontestably sustained it in the early days of the Second Empire. It would no doubt obey orders, and would aid in establishing a reign of repression; but the Republicans have now little faith in barricades and street conflicts, and the army would have no work at home. This state of things could not go on, and the only vent that could be given to the army would be a German war. The Ultramontanes, having destroyed one of their two great enemies, the French Republic, would work very hard to destroy the other—the German Empire. They would be encouraged by success, and they might in the chances of things find some opportunity of weakening Germany by divisions, and then choosing the moment for attack. A war with Germany would in all probability not be a great success for France; but then it is equally likely that it might not be very disastrous. The opinion of the best military judges appears to be that neither Germany nor France could now do much to hurt the other. There might be bloody battles and hotly contested sieges, but perhaps at the end the game would be nearly a drawn one. But the drawn game might appear in a very different light to the two parties playing it. To Imperialist France it would mean the employment of the army, the distraction of the popular attention, the gratitude of the clergy, the honour of upholding the name of France, the recovery of a dignified position in the councils of Europe. To Germany it would mean heavy anxiety, the effusion of blood, the expenditure of treasure, and the sense that new dangers would be for ever threatening. Perhaps the struggle would do something to consolidate the German Empire; but it would also tend to strengthen the military caste in the Empire. What the ordinary German wants, above all things, is peace, and peace is so inconsistent with the continued triumph of Imperialism in France, that the DE BROGLIE Ministry cannot fail to be to some degree connected in his mind with painful thoughts of the spiked helmet and the newest kind of gun, and long marches and bloody fields.

WHIG REFORMS AND AGRARIAN AGITATION.

LORD RUSSELL'S graceful hospitality to a party of working-men from London perhaps expressed a natural feeling of complacency in the state of things which has partially resulted from his own long career. In his early prime Lord JOHN RUSSELL had the good fortune to associate his name with an experiment in the diffusion of political power which was seasonable, and therefore on the whole successful. At a later period, when his popularity had declined, he resorted to the cause of his former triumphs by endeavouring to promote a further extension of the franchise. The proposal which was defeated during his short Administration in 1866 was carried with large additions in the following year; and no agitation has since taken place for an alteration of the borough suffrage. Lord RUSSELL has also taken an active part in the legislation of the last generation; and if he were still engaged in active political life he would probably co-operate with the party of movement. He now tells his admiring visitors with perfect truth that they have been liberated from nearly all restrictions of which they could justly have complained, and that their future welfare depends mainly on themselves. It is not the business of a retired statesman far advanced in years to anticipate the struggles in which his successors may be engaged. Lord RUSSELL was fortunate in living through a period in which the most obvious duty of legislators was to relax or correct existing limitations on freedom of action. It is true that some of the greatest measures passed by the Whig Government of forty years ago were not exclusively negative or destructive. The abolition of West India-slavery, the Municipal Reform Bill, and, above all, the Poor Law Act of 1834, still remain monuments of wise and beneficent legislation. In a moment of unwonted timidity Lord JOHN RUSSELL shrank from the opportunity of repealing the Corn-laws; but he aided his bolder rival in the enterprise, and immediately afterwards he profited by the consequent disruption of the Conservative party.

While Lord RUSSELL was exchanging courtesies with his guests at Richmond, an assemblage of farm-labourers in Somersetshire was addressed in inflammatory language by demagogues who may perhaps share the violence and cupidity which they strove to excite. Members of Parliament who profess to be incapable of understanding the reasons which are urged against household suffrage in counties ought not to be surprised if some apprehension is caused by the teachers and organs of their clients. The chairman of the meeting produced an instrument of corporal punishment as a symbol of the treatment which is supposed to be inflicted on the labouring classes by an aristocratic Government and Parliament. The immediate object was probably to discourage recruiting for the army as well as to propagate general feelings of disaffection. A Nonconformist preacher naturally took occasion to carry a resolution for the disestablishment and spoliation of the Church of England; but the most stirring appeal to the passions and prejudices of the audience proceeded from the agitator who has for some years taken the principal part in the movement. Mr. ARCH informed the multitude that the Emperor of Russia had done more for his people than any King of England. It would, indeed, hardly have been possible to abolish a non-existent condition of serfage; but the Emperor of Russia had, according to Mr. ARCH, given the land to the peasantry. The inference was obvious, that labourers in England might perhaps in their turn divide the land, if only they could first attain to political power. Thoughtful politicians have long foreseen the facility with which agrarian agitators might work on the ignorance of the rural population. Little is to be got by declaiming to the artisans of large towns against the monopolist owners of land. By a labourer the value of land is better understood, nor is he likely to inquire into the tenure which preceded or followed the emancipation of the serfs in Russia. It may be admitted that the mischievous threats and arguments of demagogues form no sufficient reason for withholding from any class privileges which it may on general grounds be expedient to confer; but one element for consideration when Parliament discusses the county franchise will be the revolutionary designs of some of its advocates. In modern times political questions are almost always complicated with an admixture of social and economical projects of change.

In promotion of his ulterior objects, Mr. ARCH always invites the alliance of tenant-farmers, who with some reason regard him as a formidable enemy. On questions

of wages and of the conditions of labour, farmers in the Eastern counties and elsewhere have learned to dread the interference of the Labourers' Union; but in dealing with landowners Mr. ARCH thinks it possible that occupiers and labourers may be united by the tie of a common enmity. It is true that many theorists on tenant-right have advocated transfers of property as arbitrary as the proposed subdivision of estates into petty freeholds. Mr. SHAW LEFÈVRE lately urged the extension to all classes of English holdings of the advantages which were conferred by exceptional legislation on the occupiers of little farms in Ireland. Less extreme politicians constantly devise new methods of restriction on freedom of contract between landlord and tenant. The theory of Protection fortunately became unpopular thirty or forty years ago, because those who were most immediately interested in the system formed an aristocratic minority. But the doctrine itself is perpetually reappearing in unexpected places; and agricultural reformers who would have all private relations superseded by legislation are the most habitual offenders against the fundamental principle of political economy. If it is expedient to prohibit freedom of contract in the hope of conferring a boon on the farmer, it will be difficult to resist Mr. ARCH's demands for a more comprehensive agrarian law. The present tendency of popular prejudice is curiously illustrated by a notice prefixed to an admirable essay by the Duke of ARGYLL on the commercial principles applicable to contracts for the hire of land. The Committee of the Cobden Club, while they consent to publish a pamphlet by one of the ablest and most eminent members of the Club, think it necessary to disclaim agreement with his doctrines or responsibility for his statements. In other words, freedom of private enterprise is no longer one of the principles which are associated with the memory of CORDEN.

The Duke of ARGYLL at the beginning of his treatise throws aside with merited contempt the arguments which are deduced from the existence of rude systems of tenure in primitive or semi-barbarous states of society. It is almost enough to deter men of genius such as Sir HENRY MAINE from divining and elucidating forgotten conditions of society, when the learned reproduction of extinct organizations is used as a reason for rejecting subsequent developments and improvements. The former occupation of the earth by mastodons or pterodactyls is not a proof that cows and horses and sheep may not be useful animals. During much shorter spaces of time, and even within his own memory, the Duke of ARGYLL can trace changes of tenure in Scotland which have also "been the change from men living in smoke, "squalor, and periodical starvation to men conducting "perhaps the most prosperous agriculture existing in the "world." To the argument founded on the numerous instances in which modern legislation has interfered with personal discretion or caprice, the Duke of ARGYLL replies by a thoroughly sound and accurate distinction. "During "the last half-century we have been steadily repealing all "laws which interfered with general liberty for the purpose "of obtaining any results purely economic—that is to say, "any results connected with the increase of wealth or the "success of industry. On the other hand, we have been "interfering more and more where the purpose has been "to attain moral ends, or to secure results which are "beyond the reach of individual exertion, or even of "voluntary associations." The entire pamphlet is an expansion of an instructive speech delivered in the House of Lords on the Agricultural Holdings Act. Conclusive reasons in favour of absolute freedom of contract are perhaps more convincing when they are set forth in fuller detail. The most eloquent member of the House of Lords is also one of the most forcible and most logical of political and economical writers. Tenant-farmers who might incline to sophisms constructed for their supposed benefit may profitably study the demonstration that every legislative boon to themselves will have the drawback of a corresponding increase of rent. They will also find that tenants are monopolists as well as landlords, if the invidious designation were properly applicable to either class.

THE FRENCH MINISTRY AND THE DISSOLUTION.

IT is probable that Marshal MACMAHON and his enemies are alike surprised at the calmness with which the startling measures taken last week have been witnessed in

France. No doubt this is in part attributable to the absence of any convenient machinery for displaying excitement. Neither the late Cabinet nor any other has ever dreamed of giving free course to public meetings; and, as it is difficult to be excited alone, and dangerous to be excited in the streets, the French politician is condemned to an enforced calm which must be extremely trying to his temper. On the whole, it is the MARSHAL and his advisers—it is no longer possible to draw any distinction between them—who have most to dread from the reception given to their policy. A step which bears so suspicious a resemblance to a *coup d'état* ought to have some obvious justification. If its authors cannot point to one before the event, they ought at least to be able to point to one after the event. Marshal MACMAHON is in the position of a captain who has had his ship prematurely towed out of harbour, and finds that the wind which he counted on has not risen after all. In the days of the Empire these things were better understood. If the same tactics were practised now, the morning on which the MARSHAL'S letter was delivered to M. SIMON would have seen all the approaches to the Minister's official residence lined with troops. The message to the Chambers would have taken the form of an appeal to the people, and the Chambers themselves would have been prorogued without the deputies being allowed to meet each other again. If this had been done France might, for the moment, have believed that M. SIMON was a more dangerous person than anybody had suspected, and that the eminently *bourgeois* Cabinet which has just retired was really a nest of socialist conspirators. As soon as the troops had gone back to their barracks the delusion would have vanished, and M. SIMON'S essential harmlessness would once more have been recognized. But the public mind would at least have been started on the right tack, and the Duke of BROGLIE might have been regarded for a day or two as the deliverer of his country from a danger to which he alone had the key. As it is, everything goes on as though it were August, and the Session had come to an end in the usual way. The Duke of BROGLIE has perhaps almost forgotten how he regained power, and has succeeded in persuading himself that he holds office as the natural chief of a reactionary majority. At all events, he has neither done nor said anything in explanation of the MARSHAL'S policy in taking the most unpopular man in France for his Prime Minister.

The longer the invention of such an explanation is delayed, the harder it will be to invent it. If the timid conspirators who arranged what the MARSHAL was to do, or were prepared to take advantage of it when done, had been thoroughly up to their work, they would have had a decree of dissolution ready, and presented it to the Senate at the moment of M. SIMON'S dismissal. The Right usually commands a majority in the Upper House, and the wavering members who occasionally vote with the Left would hardly have found the necessary boldness at such short notice. It is by no means so certain that a majority for a dissolution will be forthcoming when the Chambers reopen. To vote it then will be to associate themselves with the MARSHAL in cold blood; and this is just the operation which puts a man's courage to the test. If the MARSHAL wins, everything will go well. But, supposing he does not win, supposing that the decision of the country is adverse, that a majority of the deputies returned belong to the Left, that the MARSHAL, not choosing to govern in utter defiance of the Constitution, resigns his office, and that M. THIERS or M. GRÉVY is elected President in his room—in what a very unpleasant position the Senators who have voted for a dissolution will find themselves. A senatorship may not seem much to the outside public, but it may mean a great deal to the particular Senator. It may be all the distinction he has, or is likely to have, and the prospect of losing it is naturally not a pleasing one. Yet if he votes for dissolution, and the new Chamber comes back as Radical as the old, nothing but a *coup d'état* can save him from permanent retirement at the end of his term. His name will be in the black book of the Left, and his vote in 1877 will certainly be brought up against him at the next election. The waverer who has voted for a dissolution which was meant to confirm Marshal MACMAHON'S tenure of power, but which has, in fact, brought his tenure of power to an untimely end, will have but a poor chance of seeing Versailles again as a Senator. The Right will not care for him, because he is a waverer. The Left will hate him because he wavered in the wrong direction at a critical moment. The half-dozen Senators with whom

it really rests to say whether there shall be a dissolution or not will be keenly alive to those threatening contingencies, and it may easily happen that when they come to choose they may think it safer to cast in their lot with the Left. To vote against a dissolution will not pledge them very seriously for the future. It may only mean that they feel a mild preference for constitutional methods, or a mild dislike of the composition of the new Cabinet. This latter feeling is probably shared by a good many professed supporters of the new Cabinet, so that no unpopularity is likely to be earned by avowing it. If, after all, their calculations prove mistaken, and the MARSHAL does do something desperate, it will not be too late to go over to him. A Government which has successfully overthrown the Constitution will naturally be inclined to favour such constitutionalists as go over to its side; so that, on the whole, to vote against a dissolution may seem the best attainable method of hunting with the hounds and running with the hare.

If the Senate does reject a dissolution, the prospects of the new Cabinet will certainly be altered for the worse. It is not likely that the dissolution itself will be very long delayed, for the situation in the existing Chamber must very soon become intolerable, and it would not do for the Left to lay itself open to the suspicion of shrinking from an appeal to the country. The first aim of each party will naturally be to count the dissolution to its own score. The Cabinet will propose it as the appropriate means of enabling the country to condemn the Radical violence of the late Ministry. The Left will oppose it in the hope of proving to the country that even the Senate—the reactionary Senate—cannot bring itself to believe that Franco was in any danger, or that there was any need of stirring up this extraordinary commotion because M. SIMON did not always know his own mind. But, as soon as the motion for a dissolution has been defeated, the Left will be eager, or, if not eager, they will at all events wish to appear eager, to give the country an opportunity of condemning the Duke of BROGLIE's intrigues. When next the Government are defeated in the Chamber of Deputies they will be told that, if they like to dissolve now, the Left will raise no objection; and, as a nominally constitutional Cabinet cannot go on for ever in a minority, they will have to accept the permission. But to dissolve in this way will be much less satisfactory for the Government than to dissolve at their own instance. They will have shown the Senate to be against them, instead of with them, and a Conservative Government which cannot count on the support of its Second Chamber is in a bad way to begin with. More than this, the Left will be appealing to the country against them, instead of their appealing to the country against the Left; and this is not a state of things that can bring any good to the Ministry. MARSHAL MACMAHON'S Message has implied that the electors are not really represented by the present deputies, and it will have an awkward look if the challenge to put this theory to the test comes virtually from the deputies who are said not to represent the electors. All these considerations make it probable that, by the time the general election really comes, it will have sunk very nearly to the commonplace level of an ordinary contest in which the country is asked to choose between a popular Opposition and an unpopular Ministry. Of course many things may happen in the meantime to upset this calculation. The Government are doubtless hoping that the Left will say or do something violent enough to give them an excuse for applying measures of strong repression. As yet, however, even the most extreme section of the Left shows no signs of allowing itself to be drawn on in this fashion. The resolution adopted on Tuesday by the Irreconcilables is characterized by unusual prudence. When extreme Radicals take to impressing on their followers that calm energy and vigilance are above all things requisite; that prudence consists in observing the law and in using for the defence of public liberties all the weapons allowed by the law; that circumstances impose on Republicans of every shade the duty of union, and that the Extreme Left will concert with the other Republican groups as to everything which is of common interest, M. DE FOURCROU must feel with natural regret that there is little present chance of his having a barricade to storm or an insurrection to put down. So long as the Left maintain this strictly Parliamentary and constitutional attitude, they

place the Government in a difficulty which continually threatens to become ridiculous. Saviours of society are never less imposing than when they cannot find anything from which society wishes to be saved.

SERVIAN AND ROUMANIAN JEWS.

THERE has been a natural desire on the part of those who look with little sympathy on the cause of the Christian subjects of the Porte to prove that, when those Christians get the chance, they show themselves to be quite as bad as their masters. If they have been harshly treated, they are quite capable of treating others with equal harshness. If the Bulgarian has been the victim of the Turk, the Jew has been the victim of the Servian and Roumanian. All the papers in the possession of the Foreign Office bearing on the treatment of the Jews in the two Christian dependencies of Turkey during the last ten years have accordingly been asked for and published. The result has amply justified the expectations of those who hoped that the Christians would be placed in as odious a light as possible. The story of the treatment of the Jews in Servia and Roumania is precisely the story over again of the treatment of the Rayahs by the Porte. If there is any difference, the treatment of the Jews has been worse than the treatment of the Rayahs. There has, of course, been nothing like the massacre of Batak, as the Jews never gave the slightest pretext for imputing to them projects of insurrection. But there is no evidence of such daily tyranny, such fanatical hatred, such deep-seated longing to do something cruel on the part of the Turks towards the Rayahs, as is revealed in the pages of the Blue-book which tell how the Servians and Roumanians have treated the Jews. Otherwise the two stories are curiously alike. There are sad incidents in abundance in the Blue-book to parallel the records of Turkish oppression. We read of Jews drowned in the Danube, of houses pillaged, girls violated, women beaten, trembling wretches paying all their little cash in bribes to officials for a respite, and then, when all was gone, turned adrift to starve. The numbers injured were not in any case very great, because the Jews in Roumania are few; but the spirit which prompted the cruelties was as fierce and as bad as if thousands had been slaughtered. Nor is the parallel apparent only in the list of injuries. We have all the accessories so familiar in the Turkish story. We have the enlightened Minister who deeply regrets everything, and the audacious Minister who simply denies everything. One of the latter kind is especially remarkable, as he boldly declared, not only that the Jews in Roumania had nothing to complain of, but that they were actually much better off than the mass of the Christian population. Then we have mock trials, tortured witnesses, rejection of Jewish evidence; and the Roumanians have eclipsed the Turks in one way—for to all the other farces of mal-administration they have added that of trial by jury, no Jew being allowed to be a juror. Further, we have the indignant consul who really inquires, and the amiable consul who takes the version which a courteous official chooses to give him, and complacently sends it home to the Foreign Office. We have the consul who reports that none of the alleged atrocities are known to his respected colleagues, not even to the Austrian consul, who naturally knows the country by heart, and then the subsequent admission that the writer is afraid that the tale of horror is true. We have the Government sometimes stirred up by riots to make an attempt at restoring order, sometimes relapsing into utter apathy, or issuing a new decree against the Jews to please its supporters. We have the press of the capital howling against the sufferers, and proclaiming that the dignity of the country demands above all things that it must be left to do as it pleases with its own inhabitants. In short, we are in full Bulgaria; and those who take comfort in discovering that Christians can be as bad as people of any other religion may derive a poignant pleasure from every page of the Blue-book.

In one point, however, there is a difference in the two stories. For ten long years, and during almost every month of those years, England has been pressing Roumania and Servia to do justice and give redress to the Jews. There has been none of the supineness here of which English Governments have been accused as regards Turkey. LORD STANLEY, LORD CLARENDON, LORD GRANVILLE, and then, again, LORD DERBY, every Foreign Minister of

every Government, takes up the cause with the same eagerness and decision. This time, fortunately, there was no doubt as to the right to remonstrate, for the Powers which had secured the virtual independence of the persecuting States had stipulated for the equal treatment of men of all creeds. Nor did the English Government content itself with acting alone. It was continually appealing to France, to Germany, to Italy, to Austria, and to Russia to act with it. On one occasion it girded itself up to try the last weapon of diplomacy, and proposed that the terrible engine of a joint remonstrance should be called into play. The history of what then took place is most curious. Nor, if the sadness of the story as regards the Jews is left out of sight, could anything be more comical. The parts which England and Russia have lately played were precisely inverted. England proposed a sort of Berlin Memorandum, and Russia baffled her. France and Italy were willing to join; Germany and Austria were not unwilling; but Russia stoutly refused. Prince GORTCHAKOFF pointed out that the step proposed would be an interference with a Power the independence of which was precious to all. He hated persecution, but thought the Roumanians must be left to mend their own ways. Anything like compulsion from foreigners would weaken the authority of the sovereign, exasperate the natives, and render the condition of the sufferers worse than ever. Then other Powers began to see things more from a Russian point of view than they had done. Austria hesitated, Germany drew back. Turkey, which in its quality of Suzerain had been also appealed to, declared that it could not see any practical remedy except the suppression of trial by jury, and the Roumanian Ministry adroitly asked Lord GRANVILLE whether this concession would suit the views of England; to which Lord GRANVILLE replied, like a bold Briton, that nothing could be proposed which he should dislike more. He mildly suggested that Jews should sit on juries; but the Roumanians said this was quite out of the question, and so the matter dropped. Diplomacy did nothing whatever for the Jews, except that it mitigated for a time the employment of persecution on a large scale and by open riots. Fear of scandal impelled the Government to some sort of activity. But this is the very most that can be said, and at last the Jews informed the Consuls-General that they thought they should be better off if foreign Governments did not interfere on their behalf. They had indeed one most singular champion. The United States had thought fit to mark their zeal in the cause of humanity by appointing as their Consul at Bucharest an American Jew, and this Jew was a Jew of a very famous kind. He claimed a sort of supreme mission to drag all the grievances of the Jews to light, to listen to every tale any Jew would tell him, to thander his wrath at the Government, and to wage a war with Roumanians in general. The consequence was that, as the English Vice-Consul wrote to Lord GRANVILLE, "M. PEIXOTTO now goes about armed with a bowie-knife and a revolver, and threatens to use them on the very 'first occasion.'" *Si vis pacem para bellum* appears to have been the motto of this remarkable diplomatist.

So far as the Roumanians and Servians condescend to excuse themselves, their excuse is that it is really quite impossible not to hate the Jews. They are so incredibly filthy and nasty, they nourish such horrible diseases in their disgusting dwellings, they are either so rich through their vile commercial arts that honest Christian traders must loathe them, or they are so wretchedly poor that it is distressing to think they should be alive. The precautions taken against these objectionable creatures are the following:—They are not allowed to hold houses or land, they are not allowed to live in the country, they are not allowed to sell spirits. No foreign Jews are permitted to come into the country, unless they can distinctly prove that they are so well off that it would be quite monstrous to turn them away. No Roumanian pretends that Sir MOSES MONTEFIORE or Baron ROTHSCHILD ought to be turned back at the frontier, although there are Roumanians who assert that the authorities would be quite justified in sending away Jews even of this class, if they thought fit. At one time the bright idea struck the Roumanians that something more might be done than had ever been done before. What if the Jews were turned bag and baggage out of Roumania? This would solve every difficulty. The great question was where to send them. The experiment did not seem very promising if tried on Austria or Russia; but there was no knowing what the Turks would stand, and so it was decided to try

Turkey. But even Turkey was to be treated with some respect, and therefore the batch of Jews selected as the pioneers of their nation were not landed on the Turkish mainland, but on an island composed exclusively of mud, not far from the Turkish shore. There the Jews were left to take their chance, and when they were discovered by the Turks they were simply taken back to the Roumanian shore. The Turks had enough bag and baggage of their own, and did not want any addition. To avoid complications with the Roumanian mob which was watching the proceeding, the Turks did not go quite up to the opposite shore, but stationed themselves near it, and made the Jews leap into the water. Two were drowned, although the rest got off with their lives; so that at least the Roumanians had not had all their trouble for nothing, but succeeded in reducing the number of Roumanian Jews by two; and even a couple of Jews less in the country seemed something to be thankful for. But the Jews are the most tenacious people in the whole world, and not even persecution can keep them wholly down. They are not allowed to sell spirits, but they do sell them. They somehow manage to keep possession of their beloved stores, where they retail alcohol, blended, as it is popularly said, with vitriol. Mr. VIVIAN, who until recently was the English Consul-General at Bucharest, was so struck with this curious fact that he made a tour of personal investigation to inquire into its causes. The conclusion to which he came was that the Jews kept the spirit-stores for the simple reason that the Christians were too stupid to understand how to keep them. The Jews have that inborn superiority over their persecutors which fits them to keep a very low public house—a flight of genius too high for the noble Roumanian with his guaranteed independence and his enlightened religion. The Jews are no doubt very dirty and very disagreeable, but they are cleverer than the Roumanians and the Servians, and far more industrious. This is the simple secret of their sufferings. They are hated just as a lot of a boy whose waistcoat is smeared with grease, who plays at no game and joins in no conversation, but who gets to the top of his class, is hated at school. The Roumanians and Servians at once despise and fear the Jews. They can neither do with them nor without them. There are thus lulls and crises in the persecution. Loathsome as the Jews may be, yet men who have a natural thirst for a mixture of spirits and vitriol would rather have it from a Jew store than not have it at all. The Jew lives on sufferance. Suddenly some one is more vexed with his prosperity than cheered by his liquor, and the Jew is denounced, sold up, and ruined. Then he or some other Jew begins again, and so the life of Jews in Roumania passes away—one of the saddest and most forlorn lives, as it would seem, lived by any of the children of men.

THE CLYDE SHIPBUILDERS' LOCK-OUT.

AT a time like the present, when the industrial prospects of the country are so gloomy, and there is so much uncertainty and anxiety as to the future, such an event as the lock-out of the shipbuilders on the Clyde is a most unfortunate aggravation of the general distress. This dispersion of labour began to be partially carried out on Saturday last, with the effect of throwing 10,000 men at once out of employment; and, if a settlement is not immediately come to, the total number will probably amount to from 25,000 to 30,000, involving a loss of not less than 50,000*l.* weekly in wages, to say nothing of the consequent hardships inflicted on the families of the workmen and on the shopkeepers of the district. Nor is even this the limit of the impending evil; for, apart from the waste of resources in the meantime, the complete stoppage of the shipbuilding business may drive the trade away from the river, which, it will be remembered, was the result of a similar strike some years ago on the Thames. Under such circumstances, the lock-out is obviously a calamity of the first magnitude, as bad in its way as a famine or an epidemic. The Trade-Unionists, of course, are raising an outcry against what they consider a tyrannical outrage on their supposed liberty to annoy and paralyse their employers without being exposed to reprisals; but in cases of this kind the question always is, who, in the main, are to blame? For the lock-out in itself the employers are immediately responsible; but it is only fair to assume that they have not taken so grave a step without careful consideration;

and they are also entitled to plead that it is an act of self-defence into which they have been forced by the conduct of their men. Some time ago there was a general combination of the shipwrights, riveters, and other classes of shipbuilding operatives on the Clyde—whose working hours are only fifty-one a week, while on the Tyne and in most English ports they are fifty-four—for the purpose of demanding an increase of wages which, in one way or another, would have amounted, it is said, to nearly fifteen per cent. on the current rate. The trade was then in a depressed condition, with no likelihood of early improvement; and most people will think that the agitation occurred at a singularly inopportune moment. This was, at any rate, the view which the employers took, and they at once gave notice that they were resolved to resist such demands to the utmost, as it was quite out of their power, in the then state of the markets, to agree to them except at a dead loss. Thereupon the ironworking section of the operatives quietly went on with their work on the existing terms; but the shipwrights, after asking to be allowed to examine the books of the firms with which they were connected in order to ascertain their precise financial condition, which was of course refused, struck in a body. Although, however, the strike in itself was confined to the Glasgow shipwrights, it was evident that all sections of the trade, though continuing to work, were practically supporting it.

The operatives of the Clyde yards, in fact, adopted the tactics which had formerly been tried, not with success, by the Welsh miners—that is, to attack the proprietors in detail by strikes in particular cases, while the general body of men drew their wages as usual and assisted those on strike, whom they recognized as fighting their battle. The employers naturally objected to be dealt with in this piecemeal fashion; and felt the necessity of combining for joint protection. The present lock-out no doubt affects in its operation a large body of men who are willing for the present to work on the masters' terms, and who complain that they are very unfairly treated in having to suffer with the strikers. It does not require much reflection, however, to see that, however grievous a lock-out may be in some of its effects, it is practically brought about by the men themselves, and that they have it in their power to save themselves from it. The ground on which the employers profess to have acted is that the shipwrights' strike was only the beginning of a combined movement against themselves, and that it was necessary to put a stop to these constantly recurring agitations for advanced wages, which placed those against whom they were directed in a very disadvantageous position, both from the uncertainty which was thus imparted to the fulfilment of contracts and the increasing expense of their arrangements with their hands. Hence they determined to make a stand at once, and the lock-out was applied not merely to the Glasgow shipwrights, but to the whole body of workmen engaged in the different branches of shipbuilding along the Clyde. This was certainly a very sweeping measure, and its consequences are for the time deplorable; but it is possible that it is only by a decisive proceeding of this kind that the difficulties out of which these strikes and lock-outs arise can be met. In other words, lock-outs are the direct and unavoidable results of strikes.

This system of warfare, barbarous as it may seem, is unfortunately now an old story; and, though it might no doubt be conducted with greater moderation and reasonableness on both sides, there is at present no apparent probability of a more satisfactory substitute being discovered. It is natural and inevitable that there should always be a certain element of conflict in the relations between the employers and the employed. Each side has a perfect right to make its own terms, and in all branches of industry there is the same struggle. Among most classes of the community, however, people have the good sense to take what they can get, even though not satisfied with it, or else to seek some other employment. Strikes are never heard of among clerks or shopmen. It is the labouring class alone who imagine that they have a right to settle their wages for themselves, or else to leave off work altogether; and there cannot be a more short-sighted and foolish idea. It is no doubt in a certain degree a loss to an employer who has costly machinery to use to have it brought to a stand-still for want of labour; but his capital remains, and he can invest it in other ways. As a rule, a mechanic has only his labour for capital; and if he puts his hands

in his pockets and refuses to work, he loses it altogether while he maintains this attitude. It is often said, and in theory it is true, that co-operation is the proper resource for workmen who quarrel with their employers; but the experience of this system shows that in carrying it out brains and business capacity are at least as indispensable as physical power, and are entitled to adequate remuneration; and thus the old difficulty continually arises.

Of course this is all very stale and threadbare talk, and is familiar to every one, but it is not the less true; and, though there are unquestionably not a few employers who are too hard and grasping, just as there are labourers who are too greedy in their own way, it is on the side of the men that the most conspicuous ignorance and blundering are usually displayed. The leading principles on which the Trade-Unions usually act are essentially false and mischievous, whatever may be their effect in particular cases. When the markets are good and steady, it is natural that working men should expect to have their share of this profitable state of things; and, under such circumstances, they are generally able to get it. But, on the other hand, there are bad times when the employers are pinched, and when the men also must expect to be not so well off. The idea that wages are always to be kept up to a certain point or even to advance, irrespectively of the general condition of the trade and the way in which the workmen do their work, is a pure delusion; yet this is practically what the Trade-Unions have been trying to carry out. The great aim of these organizations is by artificial and arbitrary rules to multiply as far as possible the number of people who are engaged on any piece of work, to equalize the pay without regard to relative skill or honest industry, to shorten hours, to check production, and at all hazards to raise wages. According to a calculation which has lately been made, the number of men employed in the coal-mines increased between 1861 and 1875 by 80 per cent., while the output only increased by 51 per cent., the cause being that it has been systematically kept down by the miners, who now turn out only, on an average, only 219 tons per man as compared with 305 tons in former years, thus reducing the value of each man's service. There has also been a steady effort to shorten hours of work, and to put down piece-work, as affording a fair estimate of a workman's value to his employer. In the present instance of the Clyde shipbuilders, the *Industrial Union*, the organ of the Trade-Unionists, charges the employers with trying "to bring on a general fight for the purpose of winning back long hours and the lowest possible wages," and asserts that "the men cannot permanently accept conditions of work and life that they have been forced into during a deep depression of trade, and therefore defeat now only makes future warfare necessary and certain." The answer to this is obviously that wages must correspond to the fluctuation of markets, and that, while the markets are depressed, working-men must be content with less than in prosperous times, on account of the diminished demand for their labour and its reduced money value. In the same paper we find illustrations of this unreasonable temper in other trades. "The miners of Lancashire and Cheshire," we learn, "have resolved to oppose the action of the masters in the threatened reduction of ten per cent. in wages," and to "support the men on strike to the best of their ability." The nut and bolt makers of the Midland counties also claim to retain the wages of good years in the present days of utter depression; and the Bromsgrove nailmakers are equally blind to the circumstances of the day, and have "unanimously resolved not to take out the iron at a reduction," and "processions of nailers parade the town, singing hymns and loudly cheering, as if the battle were already over." In a report to the Ironfounders Society the Secretary says:—"We are sorry to say that labour appears to be at a discount all over the civilized world, and this is not because it is not required, but simply because its products are not equitably distributed. The millionaires get the lion's share, and it may be truly said, 'Unto him that hath it shall be given, but unto him that hath not it shall be taken away.'" Here, again, it is clear that the depression must necessarily affect the demand for labour, and that its price must go down, employers being subject to similar conditions. The Scotch miners, too, want an advance of five per cent. down, and another five per cent. in July. Yet all the time the coal and iron trades have very much declined, and of course the lock-out on

Sir THEOPHILUS SHERSTONE had, before he adopted a decisive measure, taken the precaution of communicating with the Kaffir chief who was last year at war with the Transvaal. It was ascertained that the supposed treaty of peace was not regarded as binding, and that fresh hostilities would immediately recommence. On a balance of inconvenience, Lord CARNARVON's agent thought it better to anticipate the war than to wait for the application for aid which must almost certainly have ensued. Any terms which seemed expedient might have been imposed as conditions of assistance; but it might not have been easy to terminate a war which had once begun. It is significant of the state of affairs that the annexation is generally regarded as complete and final, although Sir THEOPHILUS SHERSTONE's authority is only provisional. In point of form the SECRETARY OF STATE may at his pleasure treat the arrangement as temporary, and restore independence to the Transvaal as soon as the immediate danger has passed over; but there is little chance of the adoption of a course which would be inconsistent with Lord CARNARVON's general policy. The language

SIR THEOPHILUS SHEPSTONE'S Proclamation is a vigorous and argumentative State paper. With sound judgment the Commissioner dwells almost exclusively on the reasons which render annexation necessary for the safety of the Transvaal itself. The interest of the neighbouring communities in preventing a native war is, for the most part, rather implied than expressed. The Dutch farmers are reminded that of late years their Republic has been growing weaker, while the power of the natives has increased in a still larger proportion. The local Government has been unable to extend its protection to some of the border districts, and consequently the settlers have been compelled to hold their lands by the tenure of paying a kind of tribute to native chiefs. Some surprise will be excited by the statement that the people of the Transvaal were exposed to the danger not only of external but of civil war. It may

which he has used both in his speeches and his despatches expresses a conviction that all the civilized communities in South Africa ought as far as possible to be united. His instructions to Sir THEOPHILUS SHEPSTONE would not have provided for the case of forcible annexation of the Transvaal unless such a measure had seemed to be permanently expedient. At home the COLONIAL SECRETARY has no opposition to apprehend. Both Lord CARDWELL and Lord KIMBERLEY concur in a policy which is entirely consistent with the doctrines which they maintained when they were in office. There can be little doubt that, whatever course may be adopted by the Ministers at Cape Town, the annexation of the Transvaal will be popular among the South African colonists. The existence of neighbouring independent States involves the possibility of commercial exclusion, of political rivalry, and perhaps of war. When one of the Dutch Republics is already subjected to English supremacy, there is perhaps a better chance of including the Orange Free State in a South African Federation. Even the native tribes, if they understood their own best interests, would welcome an arrangement which renders war more formidable, and therefore less probable. The only drawback is the forcible method of annexation, which will probably long be resented as a grievance.

THE CATTLE PLAGUE AND FOREIGN MEAT.

WHILE the Select Committee on the Cattle Plague are resting from their labours, it may be useful to re-state the argument in favour of prohibiting the importation of live cattle from the Continent. Unfortunately the question has come to be regarded as a contest of irreconcilable interests; whereas, if it could be looked at without prejudice, it would be seen that in the long run the interests of everybody concerned are substantially identical. There are two classes of persons whom legislation on the cattle plague will affect—the breeders of cattle and the eaters of meat. It is alleged on behalf of the former that the cattle plague may at any moment break out among their stock, and that, though the compensation paid for the cattle destroyed in consequence of such an outbreak may preserve them from absolute ruin, it does not protect them against heavy loss. They say, further, that this loss can invariably be traced in the last resort to the importation of cattle from abroad. The cattle plague is not an indigenous disease; it is always communicated to English herds by some infected stranger. More than this, they contend that the public themselves suffer largely from this same cause. Cattle cannot be compulsorily slaughtered without regard to the condition they are in or the demand that there may be for them, without a very considerable rise in the price of meat. Of the supply which in a normal state of things would be sent to market at regular intervals, part never gets to market at all, while part is hurried thither all at once. Nor is this the only loss the community has to bear. The compensation paid to the owners of the slaughtered cattle has to come out of the public purse, and it is impossible to avoid paying it, because without it there would be no certainty that the infected beasts would be slaughtered and the progress of the disease checked. To all this it is answered on behalf of the public that the farmers must not be taken as judges in their own cause. It would not be enough for this purpose to forbid importation of cattle after an attack of cattle plague has broken out. When once the mischief has found its way into the country, a great deal of loss may have to be incurred before it can be finally stamped out, and the declared object of the farmer is to make any future outbreak impossible. The buyer of meat, therefore, will be in the position of the buyer of bread in the days of the Corn-laws. The supply of home-grown food will be excellent in quality and abundant in amount, but it will be entirely in the hands of the raisers of cattle. There will be no competition from abroad, and consequently nothing to prevent prices from being maintained at any level which the stock-farmers choose. This will especially be felt in London, where foreign cattle are chiefly sold. There will be no scarcity of meat for those who can afford to pay the prices asked; but, inasmuch as cattle brought from the grazing counties will have to travel by more expensive modes of carriage than the cattle brought by sea, these prices will, even apart from any combination among those whose interest it is to keep them up, be necessarily higher than they are in

presence of foreign competition. From the consumer's point of view, even disease is preferable to prohibition. Disease comes by fits and starts, and the discomforts of a year of scarcity may be compensated by the comforts of several years of plenty; but the effects of prohibition are continuous.

These are pretty much the arguments used on each side, and when first the cattle plague appeared in this country there was certainly something to be said for the consumers' view of the question. On the whole, we think that it was a wrong view, because it left out of sight the very small proportion of cattle that comes from abroad, and the immensely preponderating proportion that is bred at home. With free trade in cattle the amount of foreign meat eaten in this country is not more than from 5 to 7 per cent. of the whole quantity consumed. Consequently the competition among the sellers at home has a very much greater influence in determining the price of meat than the competition between home sellers and foreign sellers. The position of the farmer under the Corn-laws was a different one from that which he would hold if the importation of cattle were forbidden. He could not grow as much wheat as experience has shown the country was able to consume, but he is able to breed as much meat as the country is able to consume. If English wheat had been liable to a disease brought from abroad, it would still have been to the interest of the consumer to abolish the duty on corn. He would have had less home-grown bread to eat whenever the wheat crop failed from disease, but then the deficiency would have been made good from abroad. But, supposing the supply of cattle to fail from disease, the deficiency could not be made good from abroad. The obvious inference from this distinction is that the consumer is directly concerned with the health of home-grown cattle. He cannot replace them at his pleasure when they are destroyed; at any rate he can only do so at a cost which would raise prices to a higher level than that which they would reach under a system of prohibition. If free-trade only brings us 5 per cent. of our meat, the health of the 95 per cent. which is grown at home is of more importance than the unrestricted import of the fractional balance. Still the influence on prices of the withdrawal of a part of the ordinary supply is sometimes out of all proportion to the amount withdrawn; and when first the cattle plague appeared, the consumer might have used this fact as a reason for preferring the risk of disease involved in the continuance of importation to the risk of high prices involved in the prohibition of importation. The choice might have been a mistake, but it would not have been altogether unreasonable.

All reasoning, however, which is based on the identity between the prohibition of the importation of cattle and the prohibition of the importation of meat has been upset by the recent improvements in the arrangements made for the transport of carcasses. There is every probability that, in the ordinary course of events, the importation of cattle will be superseded by the importation of meat as soon as the traders at present concerned in the former traffic have had time to transfer their capital to the latter, or as soon as other traders have brought new capital to new undertakings. The recent arrivals of American beef have made this clear. There are many qualifying considerations to be taken into account when speculating on the influence which this particular import will have on the English meat supply; but none of these affect the fact that fresh meat can be brought from America and sold in London at a cheaper rate than meat killed in England. There may be doubts as to the quality of the meat, and doubts as to the extent of the supply. But the doubts as to the quality relate to the breeding of the cattle, not to the mode of carrying the carcasses; and the doubts as to the supply relate to the possible increase of the home demand in the United States, or to the possible competition of more profitable ways of employing capital. Given that foreign-grown meat can be introduced into this country, and be sold at a price which will pay the foreign growers, there is no longer any advantage in introducing it alive rather than dead. If it is possible to bring dead meat by ship from America, there are other countries from which it can be brought in the same way and in a shorter time. If it is objected that a great deal of our foreign meat supply comes from inland grazing grounds, and that to slaughter it at home and then send it to England will involve carriage by railway as well as carriage by sea, and that the former is much the more expensive, the answer is that there will be no more need to

bring dead cattle by train than there now is to bring live cattle. The foreign cattle which come to England from Rotterdam or Hamburg must first get to Rotterdam or Hamburg. It is not proposed to make any change in the earlier stage of their transit; that is a matter for those who breed them and consign them to these ports to consider. The change in the method of transit to England only takes effect when the cattle have reached the port of embarkation. The new system says to the owner of a herd of cattle standing on the quay at Rotterdam—Spare yourself the trouble of putting all these beasts on board ship with the certainty that some of them will die from the sufferings they experience on the passage, and that the value of all of them will be lessened from the same cause. Have them slaughtered where they stand, and their carcasses shall be carried to England so as to ensure their arrival in as good condition as though they were brought alive to London and then slaughtered. It will be found by degrees that the carriage of meat in good condition is a very much easier problem than the carriage of cattle in good condition; and meat necessarily takes up less room when it is dead than when it is alive. The cost of conveyance will be less, and the profit to the seller greater. Probably, as the new system becomes better known, the methods at present employed for bringing cattle from the interior to the coast will be found to admit of improvement. The expense of carrying dead meat by railway is so much less than the expense of carrying live cattle that we may expect to find an increasingly larger proportion of cattle slaughtered at the place of breeding, and carried thence to England in vans which will be merely transferred from their place on a railway-truck to their place on a steamer's deck. At the annual meeting of the Royal Agricultural Society on Tuesday, it was stated that contracts had been entered into for the supply direct from the slaughter-houses of Vienna of the carcasses of fifty thousand sheep and from three to four thousand oxen. The meat will arrive in England in from fifty-four to sixty hours from the time it is killed. Prohibition of importation of live cattle has now become a consumer's question. Prohibition means speedier arrangements for the introduction into this country of as much foreign meat as can be disposed of, together with absolute security against any diminution of the home-grown meat supply by reason of cattle plague. Importation means delay in the perfecting of the arrangements for the introduction of foreign meat, combined with a constant risk of losing a large part of the home-grown meat supply from the cattle plague. If consumers understood their own interest, their demands for the prohibition of importation would be too loud and too importunate for the Government or Parliament to resist.

INTELLECTUAL WOMEN.

THE question which used to exercise French wits, as to whether ink stains might not be thought ornaments to a lady's fingers, has long ago been decided. It is one of the questions to which, as British Hegelians are fond of saying, you cannot answer "yes" or "no." It implies more than is explicitly stated, and is settled by the formula that women may read and write without neglecting the simple and obvious duty of washing their hands. No one expects a man of letters or a philosopher to go abroad with the mark of his vocation upon him, and to put the problem in the old shape was to insinuate that literary ladies were less careful than men in their dress and habits. We may grant that this particular sneer is out of date, and yet it does throw light on the great cross of intellectual women, and on the chief snare that besets them. The world has not loved them, nor even behaved with ordinary fairness in its judgments of them. If women followed their natural instincts, if all their talk was personal, and if all their interests lay in their dress, their admirers, their rivals, and their families, they were sneered at as frivolous and mindless. And when they turned to the things of the mind, they were condemned as prigs, pedants, *précieuses*, and blue-stockings. The reason of these latter charges is found by the advocates of the fair in the jealousy of man. But the real cause is to be discovered in that eagerness of converts which impelled some of the *précieuses* to be as slovenly as the most grubby old *savant*, and which still urges clever women into provoking extremes of intellectual abandonment.

Ladies seldom take up intellect as a habit of life very early in their career. Their girlhood has, up to the present enlightened decade, been passed even as the girlhood of the most frivolous sister. They have never had their time to themselves; but, in the nursery, school-room, and drawing-room, have been forced to walk in the prim paths laid down by early governesses. French grammar, the piano, Mrs. Markham's England, and a comparative study of the mountain heights of South America do not awaken, arouse, and stimulate original thought. A woman has gone through her

girlish years, and had her round of dances, flirtations, country visits, and proposals, before she has a chance of discovering that she too has a mind, and likes to read history, or philosophy, or mathematics, as the case may be. By the time the discovery is made, the slow battle of freedom has also probably been won. The despotism of father or of brothers has been fought down, and only ancient aunts from a country town fire the distant and random gun of remonstrance, and wonder what Matilda will do next. Matilda, feeling that the time is short, makes progress with desperate energy, and her whole being is absorbed in her new pursuits. Nothing can be more disagreeable to the old friends of the intellectual woman. They soon notice that she takes no interest in their conversation about their neighbours' incomes and bonnets. What the intellectual woman loses in their esteem she does not gain in that of men interested in the same pursuits as herself. This is not because they are jealous, as is fondly supposed; but because, when they meet the opposite sex, they wish "to forget their barren knowledge awhile." They have a hundred other interests, which came to them in their youth. Cuneiform inscriptions, the Popes of the Renaissance, chemistry, or Greek, or poetry, or novels, are the business of their working hours, and "intellectual hygiene" demands that they shall sometimes forget them. But to forget them in the presence of the intellectual woman is to insult her bitterly, and to "think her not worth talking to." Very few ladies attain Miss Martineau's pretended dislike of "shop." In her sublime conceit, that worthy woman posed as a mistress of her subjects, and she was only vexed when young barristers, mere amateurs, tried to draw her out about education and the gratifying diminution of crime. She soon let them know that she was not as other intellectual women, though it is not even now possible to guess how her neighbour at dinner was to approach her in conversation. The majority of her sisterhood still terrify the weary by their zeal in season and out of season. This ardour of the convert is perfectly natural and excusable; but it answers to the ink stains on the fingers. Intellectual women, *serie studiosum*, have discovered a sort of safety valve, an outlet for their pent-up knowledge, which is adequate, indeed, but not otherwise useful. They have fastened on the examination system with a ferocity of enjoyment which is likely to perplex a much examined race of men. What the male student seems chiefly to pine for at present is a respite from examinations. At school he was always passing, or failing to pass, into a higher form; and when he reaches the Universities he grumbles that his valuable time is wasted and his unique power frittered away by tests derived from the benighted Chinese. To hear a young and illustrious don speak of the "examination system," one would think he was denouncing the baby-farming system, or the coolie system, or clerical fellowships, or some other flagrant abuse. He does not know what a sweet boon papers of questions are to ladies who cannot elsewhere find a free outlet for their opinions about the divorces of Henry VIII., the tactical errors of the French at Crecy, the origin of trial by jury, and a hundred other delightful problems in history, arithmetic, logic, and kindred sciences. Persons whom one would naturally expect to turn their knowledge and talents to more practical purposes simply revel in passing every examination of which they can hear at every local centre coloured on the map of England. Thus institutions which were intended to test the knowledge of the young become a restricted form of publication, in which a very great deal of knowledge, cleverness, and enthusiasm is scattered to the winds and the waste-paper basket. The zeal for passing examinations might be ascribed by the cynical to emulation; but, as a rule, the results of these competitions are not blazoned abroad in such a way as to please conceit. Diffidence about approaching a larger public, more than love of display, crowds examination rooms. It is plain that their popularity indicates a mere moment in the history of the devotion of women to study.

It is provoking to be attacked at a picnic with questions as to the date of Papias. The deck of a yacht is not precisely the spot on which to start a hunt after the real nature of the Absolute. The gentleman who complained that his partner in the waltz insisted on "drawing" him as to the relations which may be presumed to exist between Time and the Unconditioned had good reason to grumble. Comte's opinions about the characteristics of the architecture of Positivist cathedrals are too recondite to be discussed over soup and fish. At a boat-race a young man's fancy does not turn to thoughts about the Stone Age in Egypt. Advanced ladies are apt to bring these and similar matters on to what novelists still call the *tapis* just when one would least expect them. It is rather absurd to carry on a conversation in such circumstances in the serious spirit of Socrates and Diotima. And it is difficult to put the questions by without being accused, when opportunity serves, of superciliousness or rudeness. Every one has not in such a juncture the audacity of the man who explained the word "idea" to be the Russian term for female idiot. It is not given to every one, when asked out of season what sort of book so-and-so is, to reply that it is a small pink book. Even where the impudence exists, the brutality need not be present. The science of snubbing is one which ought never to be practised under the temptations to which we have referred. We must wait till things find their level, till the studies of men are approached by women early in life, and are gradually assimilated, not pounced upon by a sudden effort and made the one absorbing interest of existence.

The friends of the higher education of women may declare that the present position of the eager seeker after knowledge is merely the discomfort of a stage of transition. That "we do indeed live

in an age" is almost the only point about which all comprehensive theorists are agreed. When they go further they are found to differ among themselves as to the precise character of this period; but there is a certain consensus of opinion on the side of the idea that we live in an age of transition. The intellectual woman of the moment finds herself deep in this vale of rapid change, and she has to take the consequences of the situation. But the friends of the higher education aim at bringing up a sort of young ladies who shall be intellectual from the beginning. Their eyes will open on the tree of knowledge, even of mathematics and the dead languages, at an age when their aunts were still in the bond of the use of the globes, and the gall of elementary musical exercises. Thus science, in the eyes of the new generation of girls, will have none of the temptingness of the forbidden, the occult, the unfamiliar. When the apple is always within reach, and free to be plucked, the apple will no longer be snatched at in season and out of season. Knowledge will be gradually assimilated, not greedily devoured. There will be no more mistakes about what is essential and what is merely accidental. Lectures on *omne scibile* will no longer be crowded by feverish takers of exhaustive notes. Examinations will cease to be regarded as delightful excitements and charming opportunities of display, which the jealousy and selfishness of men have too long reserved for their private enjoyment. When study becomes more or less a thing of course among a certain number of women, and offers a career, ladies will take the thing with as much coolness and leisure as public schoolboys and undergraduates do at present. In the next generation the position of intellectual women will be secured, and the fretfulness of novelty and of enthusiasm will have been worn off.

This is a hopeful and a not improbable theory or prophecy. Looked at with the eyes of calm approbation, and of criticism as nearly as possible impartial, the whole scheme shows one or two weak points. It will always be difficult to get as many side interests into the lives of women who devote themselves from youth to study and education as men engaged in the same pursuits enjoy. Athletic sports, which are always either blamed or praised too much, do some good by diverting attention from the strain of intellectual ambitions. All the free life and adventurous existence of the student keeps the mind open and fresh. It is hard to see how the advocates of the higher education of women propose to secure for them advantages of this sort. Their spirit of emulation is far keener than ambition among young men. Their concentration is almost febrile. Their very conscientiousness comes out strongly in their pursuits, and they grudge themselves every holiday and the most simple pleasures. Too much stress may be laid on these characteristics by theorists who expect a learned generation of women to be the mothers of a race of turnip-headed Englishmen with a native tendency to water on the brain. Still a survey of the surface at least of the whole question seems to show that the learned life is only for a rare woman here and there, peculiarly favoured by circumstances. This is a thing that ladies need not regret. "The meanest creature that lives, a spider or a toad," said Hazlitt, "has its mate or fellow, but the scholar has no mate or fellow." Not many women would choose to be scholars with the certainty of this loneliness before them.

THE GRAND ROPE OF THE CATARACT.

PEOPLE who do not mean to take their boats above the First Cataract into Nubia go from Assouan to Philæ by road; people who are going further remain on board and ascend the river. As there are only five miles between the two places, both ways are traversed by most tourists, the land road being through an interesting valley and past the ancient quarries; but the river is much more exciting to an ordinary traveller. The archaeological objects to be seen are few, but there is wild scenery, and there are wild men, and there is the grand rope of the Cataract, of which he hears at every turn. The boat is no longer under the conduct of its own officers and crew, but is handed over to a deputation from one of the villages on the bank. They all belong to a tribe of professional pilots, and derive their means of livelihood from their skill in navigating the rapids. It is not easy, however, to get away from Assouan. Every difficulty is made by the too hospitable authorities. The channel is narrower than it was last year; your boat is six inches too long or too wide, or the channel is wider and your boat too small. There are two boats and a steamer before you; the wind is against you and too strong, or it is for you and too weak, or perhaps wanting altogether. The grand rope is out of order, or has been lent. On the whole, you delay some ten days, and have leisure to write letters, to visit the bazaar, to call on your fellow-travellers, to explore the valleys, and perhaps to go to Philæ by land on a camel or on foot or both, before your own summons comes to tempt the dark passage and the raging billows. At length you leave the moorings under the rocky side of Elephantine. The boat is ruled by a howling crowd of more than half-naked strangers, headed by an ancient Arab who may be described heraldically as "a salvage man, sable; vested, azure; and wreathed about the brows, argent." There is a narrow passage between Elephantine and the eastern shore. High red granite rocks, every flat surface covered with hieroglyphics, are on the left hand; and on the right is the northern end of the island, crowned by great masses of Roman masonry, founded below on rounded boulders of enormous size. Some of these show

marks of being water-worn, others are fresh as if broken but yesterday. The imaginative traveller may trace in one, just beneath the Roman wall, the form of an elephant rising from the river, and may inquire the possibility of its having given the comparatively modern name to the island. Higher up, the stream is dotted all over with black rocks, a little green patch appearing here and there. The hills on your right—that is, on the western bank—are of drifting yellow sand, almost to the water's edge. On the eastern side there is nothing but granite, sometimes in great boulders, heaped up to the height of two hundred feet, or even more, every hill crowned with a domed mosque; sometimes rolling down to the shore like the track of a great watercourse, every pebble the size of a house. In front, due south, are the rapids, where green islets, frowning rocks, and narrow-rushing channels form a labyrinth whose intricacy is not diminished by the rays of a blazing sun. Though Ptolemaeus thought he had found the tropic at Syene, it is really some thirty miles further south; but half a degree makes little difference in the sun's height at noon, except to an astronomer. Everything seems to shine—even the sand. The water is dazzling; the rocks are polished, so that they look as if they had been covered with blacking and varnished. The ancient Egyptians knew that even syenite may be polished with sand and water. The sailors who buzz wildly round the boat are all polished, outwardly at least, and look like bronze statues newly cast. As the dahabeeah runs before a strong breeze towards the rapids, it is well to keep an eye on the rocks which are nearest. The faces of almost all bear some hieroglyphic inscription, more or less distinct according rather to the grain of the stone than the age of the writing. Some of the most ancient cartouches are the clearest. The rocks of Sobayl bear many such inscriptions, dating back occasionally beyond the eighteenth dynasty, or fifteen centuries at least before our era. Then, as now, travellers ascended the cataracts, and Sobayl, the first island at the northern end, was sacred, like Philæ, the last at the southern.

It is weary work ascending, even to the voyager who has to do nothing. The men always leave off at the moment when it seems as if one pull more at the Grand Rope would place the boat in smooth water. They go away to their villages and come back no more for days together. It frequently takes five days to traverse the five miles between Syene and Philæ. If one day is wet, the scene is melancholy in the extreme. Nile boats are not built to withstand rain. Water pours into the cabins at every seam. There is no possibility of escape, for there are no sheltering houses to go to on the bank. The bank itself is not easily reached, for the dahabeeah is moored to a black rock in midstream, and two or three channels, each running like a mill-race, have to be crossed in order to reach the shore. In fine weather it is worth while to climb a hill and try to gain a distant view of Philæ. Such a view will reward seekers for the picturesque better perhaps than any other they will meet in Egypt. A yellow, sandy mist adds to its beauty, as the folding hills on either side, through a vista of which Philæ itself is seen, are then less distinct in their stony clearness. The pilots' villages are not so disagreeable as those of the Fellahs lower down. The Nubians are in many points superior to the true Egyptians, cleaner, more polite, more handsome, and with much less twice of misery and oppression. The pilots are exempt from conscription and from most forms of taxation, though they are forced to buy their salt from Government and to conduct the Khedive's boats through the rapids without charge. They early accustom themselves to the dangers of the passage, and while yet mere children swim from rock to rock, or float on logs round the passing boats in hopes of tempting the "howara" to throw a copper into the water. But at hauling on the grand rope of the Cataract they cannot be considered expert. They make much noise, and spend much time, but do not convey to the traveller any very exalted idea either of their own strength or that of the boasted rope.

The way from Syene by road is hot and dusty, but well worth the trouble. If, as the ancient authors seem to say, the town was originally built on an island or peninsula, it must have been because the valley behind it to the east was once a branch of the river. To reach this valley mounds of rubbish must now be surmounted; but it is possible that only rubbish intervenes between the old town and the new. Once in the valley the traveller finds an excellent road. By it, no doubt, the granite from the quarries was taken to the bank for embarkation. The great boulders have been removed from the flat smooth trackway and piled up on either side. The red hills rise on the left and right, and almost everywhere show the ancient quarry marks. At first the desolation of the region is not apparent. A patch of alluvial soil, left during some prehistoric inundation, is still kept green by a deep well. Further on there seems to be a village with many domed mosques; but on nearer inspection it proves to be a village of tombs, and the domes indicate the resting-places of generations of old sheyhs. When these are past the roadway divides, one branch turning to the left among the rocks. Here were the principal quarries; every stone shows the indentations of the wedges; here and there a flat face of granite, perhaps a hundred feet high, shows where blocks without a flaw have been cut away. No vegetation, not so much as a lichen, covers the surface, which looks as fresh as if chiselled but yesterday. Higher up, in a little ravine, lies the famous unfinished obelisk, sloping from the level ground for ninety-five feet up the side of a granite hillock. Many travellers come into the desert merely to see this stone, and return to Assouan; but similar

wonders are to be seen in plenty if they pursue the straight road forward. On the right, nearly at the end of the valley, lies a column which has never been removed. There are similar columns built into walls in the modern town, not less than fifteen feet long, and thick in proportion. The number of granite columns taken from these quarries in ancient times must have been enormous. We find them among the cyclopean works of the fourth dynasty at the Pyramids. Cleopatra's Needle and its companion at Alexandria are of syenite. The obelisks at Karnac and the shrine at Edfon are alike from these quarries. Many red granite pillars are in the churches of Rome, and even our British Museum has one. Just before the valley opens out towards the river, a tall flat stone occurs with a long inscription in hieroglyphs, and the figures of half a dozen deities. It is worth while to climb to the top and look back towards the north. The great roadway cleared by the ancient Egyptians to the river's edge at Assouan, but now obstructed by the ruins of the Arab town, may be easily traced, and an inscription recalled which states on the base of one of the obelisks which Queen Hatason erected at Karnac to the memory of her father, that it took seven months to remove it from its native bed and place it where, after the lapse of thirty centuries, it still stands.

The walk back to Assouan along the valley is very much like the walk out, unless a rough pathway by the river's side is attempted. But not so the descent of the cataract in the dahabeeah. In Miss Betham Edwards's entertaining account of a voyage, *A Thousand Miles up the Nile*, various expedients are mentioned for making the pilots hurry the ascent, including the reading of a series of Mahomedan maledictions from a note-book prepared at Cairo for such purposes. But the more effectual these expedients appear at the time, the more will the unwary traveller have to repent of them at his down sailing. If you make use of extreme measures of any kind, by invoking the Prophet from heaven or the Governor from Assouan, by knocking the sheikh down or locking him up, by peppering him with small shot or pitching him into the river, he will assuredly be avenged on you before long. He has you in his power, and he knows it. You must pass by that way again, and then woe betide you and your boat. We know cases in which all the above-mentioned measures were tried with success; but in every case there was a dangerous rock right in the channel at the coming down, a rock which the most skilful steersman could by no means avoid, a rock calculated to make a hole exactly proportioned to the amount of the moral or personal injury inflicted at the going up. It is very unpleasant to have to beach the boat at Assouan, especially as the ship-carpenters are so unskilful that she leaks all the way back to Cairo. The Englishman who all the way so far has commiserated the unhappy fate of a people ground under the heel of an iron despotism, begins to think there are two sides to the case, and that in its dealings with the "Sheikalee," or Arabs of the Cataract, the government, even of the Turks, is too mild. If he knows anything of nautical matters he pronounces the whole performance—the hundreds of men, the four pilots, the rapids, and the rope—a gigantic humbug, and longs for a dozen of stout English sailors or even dockyard labourers, or for a few pounds of gunpowder, to make one good passage out of several bad ones. He laughs when at Assouan it is determined to draw up his dahabeeah and examine her timbers, and when, with great solemnity, the four sheikhs, the governor, the reis, the deputy reis, and the dragoman hold a council, smoke prodigious quantities of his tobacco, and finally agree that nothing can be done until they have sent for the grand rope of the Cataract.

FLOWER SERVICES.

OF the various decorative adjuncts of public worship which have come to be included under the comprehensive misnomer of "Ritualism," there is one against which it might seem difficult for the sternest Puritan to frame a plausible indictment. What—over "sacrificial" or other theological significance, obnoxious to Protestant criticism, may be attached to chasubles, candles, or genuflexions, the flowers which form the natural charm of our gardens and the purest and sweetest, if not the choicest, ornament of our drawing-rooms, cannot surely be other than graceful and acceptable in our churches. We are not sure indeed that this process of reasoning, simple as it appears, has always been allowed, and in fact, with the scanty exception of holly sprigs at Christmas, the use of floral decoration to symbolize festal joy is of comparatively recent introduction into English churches. But the obvious grace and appropriateness of such a usage has done much to disarm opposition, and we believe we are right in saying that in many churches which would be loosely described as "moderate Evangelical," or very "moderate High Church," where vestments and lights are regarded as an abomination, the altar is fragrant on high festivals with a profusion of blooming nosegays. This result may perhaps be due in part, as the reporter of last Tuesday's ceremony in the *Daily Express* suggests, to the happy thought of the rector of St. Katharine Cree in introducing, nearly a quarter of a century ago, a special Whitsuntide "flower service" into that historic fane for the benefit mainly of the younger part of his congregation. Yet it must in fairness be admitted that, if the character of a religious usage is always to be rigidly defined by its origin, a much stronger case might easily be made out against the association of flowers with Christian ritual than against any of

those forms and ceremonies which the combined wisdom of Lord Penzance and the Privy Council has so elaborately condemned. Chasubles and copes, according to the most probable view, were simply derived from the Roman lay dress of ordinary life under the Empire; the worst that can be urged against them is that they were possibly modelled on the official dress of the Levitical priesthood, and thus carried with them a certain sacerdotal association, though of this there is no evidence. The religious use of flowers, however, is directly connected with some of the most questionable incidents of Pagan worship, though we are not aware that any special Christian festival took the place of the *Floralia*, as St. Valentine's day appears to have taken the place of the *Lupercalia*. May is always more or less a festal season of the Church, but the date is determined on wholly independent grounds. And the modern Roman Catholic custom of consecrating the month to the honour of the Virgin Mother, though due no doubt to the same instinctive sense of fitness which fixed that period for the feast of the goddess Flora, is of far too recent origin to have been borrowed directly or indirectly from any usages of Pagan Rome. As Dr. Newman puts it

We give to thee May, not because it is best,
But because it comes first, and is pledge of the rest.

It may seem strange, however, that other than innocent ideas should ever have been connected with this feast of flowers, and a word of explanation will not be out of place.

For some reason or other the garden was redolent in classical literature of associations the reverse of fragrant. Priapus, of evil repute, was its presiding deity. It gave its name to the most sensual and unmanly of the ancient schools of philosophy, as is implied in Præd's familiar lines on St. Paul preaching at Athens,

And the fair garden's rose-encircled child
Smiled unbelief, and shuddered as he smiled.

Flora, the Roman goddess of flowers, according to the received tradition retailed by Plutarch, Macrobius, Lactantius, and others, was a courtesan, and left to the city wealth acquired by her profligacy. The date and source of the legend is questionable, but there can be no question at all as to the gross and unbridled licentiousness of the *Floralia*, or games said to have been instituted in her honour under Romulus, and lasting five days, from April 28 to May 2. Pliny assigns the origin of her feast to the command of an oracle in the Sibylline books in 238 B.C., but we have little authentic information about it till the observance was restored some sixty years later by the ædile Servilius, acting under orders of the Senate, because the vegetation that year (173 B.C.) had suffered from the inclemency of the weather. Ovid has discussed at length in the Fifth Book of the *Fæsti*, "quare lasciviam major His foret in ludis, liberiorque jocus." And the nature of the solemnity is still more unmistakably illustrated by an incident to which Martial refers in his Epigram *Ad Catonem nimis Austerrum* (Epig. i. 3). It is related that on one occasion Cato desired to be present at the celebration, but when he found that the people were ashamed to call for the public exposure of the actresses on the stage, according to custom, while he was there, he retired in order not to interrupt the proceedings. It is probable, however, that the *Floralia* were originally rural festivals observed both in Italy and Greece, which became corrupted after their introduction into towns, and this may have given rise to the uncomplimentary story of the goddess Flora with whose worship the celebration had then come to be connected. The Christians of course borrowed nothing from these orgies, but they had touching legends of their own about visions of martyrs who consoled their surviving friends with gifts of flowers from Paradise, and the like, and the use of flowers as an adjunct of Christian worship is of very early date.

We have already intimated that the Church of St. Katharine Cree, where Dr. Whittemore has established the children's "Flower service," possesses an historical interest of its own. It was consecrated by Laud, when Bishop of London, in 1631, and Hume has devoted several pages to what professes to be a detailed account of the ritual used on the occasion, and an indignant comment on the "ceremonies to which Laud sacrificed his own quiet and that of the nation." But one may perhaps be permitted to doubt the justice of his strictures so far as it depends on the accuracy of his report. For it does not require the skill of a "liturgical" expert, or anything beyond the most superficial acquaintance with the Eucharistic service of the Church of England or the Church of Rome—which last Laud was accused of imitating—to see that the ridiculous antics ascribed to him bear not the slightest resemblance to either rite. If indeed Hume's account is to be at all literally taken, this most prelatial of prelates must have performed the Communion Service—as, according to a famous Privy Council judgment of twenty years ago, he was bound to perform it—with the Prayer of Consecration left out. That he pronounced a solemn malediction on any who should divert to profane uses the sacred building which he was engaged in dedicating is possible enough. And it is some consolation, in these levelling days, when so many of the City churches are either doomed or actually destroyed, to reflect that St. Katharine Cree still retains unchanged the sacred character originally conveyed to it by the last of the great Archbishops whose biography Dean Hook has left us. Nor is it unreasonable to assume that Laud, who had a keen eye for the didactic aspects of ceremonial, would have viewed with approval the striking spectacle presented by the interior of St. Katharine's on Tuesday evening last. The following description is taken from the fullest

report of the service we have come across, and it suggests a very pleasing picture to the eye:—

The fame of the flower service has spread abroad, and from many parts of the metropolis listeners gather together to hearken to the genial discourse that is especially addressed to the younger portion of the congregation on these occasions. Last evening, from an early hour, Londenhall Street was crowded by these, their destination easily recognizable by the fresh bouquet of spring flowers that all attending are requested to bear as a badge. Still more densely thronged was the interior of the sacred edifice, and it is doubtful whether it had ever held so many worshippers since that January day in 1631, when Laud pronounced within its newly-raised walls the solemn denunciations against those who should pollute them by musters of soldiers, or twisted profane law courts, which were in after years to be twisted by men thirsting for his blood, into one of the acts of accusation that were to secure to him the crown of martyrdom. Very full of contrast at all times is this quaint specimen of the architecture of the days of the first Stuarts, with its strange blending of the Pointed and the Italian styles, its mullioned windows and Corinthian columns, its groined ceiling, with the intersecting ribs adorned with armorially enriched bosses, and its Ionic pilasters crowned by an entablature and pediment. On its plain Gothic walls the monument where Sir Nicholas Throckmorton, some time Chief Butler of England to Queen Elizabeth and Ambassador to France and Scotland, reposes at full length, in ruff and plate armour of equal stiffness, beneath a canopy of black marble, ornamented with skulls, cross-bones, and hour-glasses, and that setting forth the virtues of Richard Spenser, Turkey merchant, look equally out of place; as do the old-fashioned pews of time-darkened wood, which we have the promise of the rector are shortly to be swept away, and the pulpit recalling in outline a carved wooden goblet. But last night a yet greater contrast was afforded by the inmates of the pews in question. The fresh young faces of children peered up from their box-like recesses, whilst on the ledges in front of them bloomed bunches innumerable of flowers, far eclipsing in brilliancy of colour the rich hues of the armorial bearings emblazoned in that great east window, the radiating millions of the upper part of which recall by their arrangement the terrible wheel to which the Alexandrian virgin was doomed by the tyrant Maximian. One and all had obeyed the request to bring bouquets, and the church was fairly scented with their fragrance.

Hymns were sung composed for the occasion, and Dr. Whittemore preached an appropriate sermon, addressed especially to his younger hearers, from the words of Habakkuk (iii. 17, 18), "Although the fig tree shall not blossom, yet will I rejoice in the Lord," in the course of which he informed them that the church would be restored, and the unsightly pews removed, before this time next year. The aisles as well as the pews were crowded, and many parents were present with their little ones, who had been in the habit themselves of attending the annual flower service from childhood. The conspicuous success and popularity of the rite confirms the evidence supplied by the services formerly held at St. Lawrence Jewry and elsewhere of the excellent purposes to which City churches may be applied by incumbents who have a mind to utilize them instead of clamouring for their destruction. Lord Penzance's reign has already been signalized by the virtual closing of one such church, which used to be thronged with devout worshippers both on Sundays and weekdays. Let us hope that many City rectors may be found to emulate the active zeal of Dean Cowie, Dr. Whittemore, and Mr. Rodwell, and that "the three aggrieved," who "come to reform where ne'er they come to pray," may graciously condescend to leave their neighbours unmolested in devotions that are at least preferable to that "worship chiefly of the silent sort" for which our City churches have too long enjoyed an unenviable notoriety.

WILL THE PRESENT DEPRESSION LAST?

M. LEROY-BEAULIEU, the eminent French economist, and, in a still more positive manner, M. de Laveleye, have propounded a theory of the prevailing depression in trade which, though open to question, is certainly worth attention. The view usually taken of the present commercial situation is that, like the crises of 1866, 1875, and 1847, it is a temporary arrest of activity, due to over-speculation and over-production, and that after a while affairs will resume their old course. That is not the opinion to which the two distinguished writers above-named incline. They are rather disposed to regard the existing stagnation as marking the close of the period of unprecedented commercial prosperity which has characterized the past thirty years, and the beginning of another period in which the growth of wealth will be less rapid, and, as a necessary consequence, the well-being of all classes will advance more slowly. The grounds on which this unpopular opinion is based must be admitted to be sufficiently strong to deserve careful consideration. At the outset, the fact must be firmly grasped and steadily borne in mind that the prosperity to which we have now grown accustomed is a very recent and entirely unexampled phenomenon in the world's history, and that it is due, in part at any rate, to causes which are clearly temporary. Readers of Lord Beaconsfield's novels will not need to be reminded of the apprehensions excited by the spread of pauperism at the time of the first Reform Act. Still more recently the agitation for the repeal of the Corn-laws was irresistible, because it was impossible to dispute the difficulty with which the working classes obtained bread. In Ireland and in the Highlands of Scotland actual famine was raging. In France, a little later, Louis Philippe was deposed, as Louis XVI. had been before him, because Paris was unprosperous. And generally throughout the Continent 1848 was a year of revolutions, for this reason among others, that it was also a year of distress. Again, in this country statesmen have grown accustomed to expect "a normal increase of revenue"; but, until Sir R. Peel began his reform of our financial system

during his last administration, successive Chancellors of the Exchequer experienced the greatest difficulty in raising the means of defraying the current expenditure. Even long after the time of Sir R. Peel the growth of revenue was very slow. During the eleven years 1843-53 the property assessed to the Income-tax increased only at the rate of one-third of one per cent. per annum, whereas from 1853 to 1863 the increase was at the rate of three per cent., or nine times more rapid, and between 1863 and 1868 it rose to four per cent. Once more, it might be shown, if we were to go back to the last century, that then also the public revenue remained almost stationary for a long series of years; but we have said enough, perhaps, to prove that the prosperity of our time is an exceptional fact. This is the first link in the argument with which we are here dealing.

The causes of this exceptional prosperity are numerous; but two stand out as pre-eminently efficient. They are the great mechanical inventions of the century, and the discovery of gold in California and Australia. The long peace since Waterloo, broken only for brief intervals, the colonization of the Mississippi valley and the Pacific coast, of South Africa, Australia, and New Zealand, the opening up of new countries to commerce, such as China and Japan, the adoption of Free-trade in this country, and of freer commercial intercourse upon the Continent, all powerfully co-operated no doubt; still the two causes named were the principal. Of the mechanical inventions, the adaptation of steam to locomotion and manufactures has had incomparably the greatest influence. The service rendered by railways has so often been dilated upon that it has almost become a commonplace; we need therefore spend no time on the subject; yet we may point to one or two of the less noted facts. To carry on manufactures on the vast scale of the present time the population had to be massed in great centres of industry, and for this railways were indispensable. In the London of to-day, for example, supposing it could exist at all without steam locomotion, fresh meat would be a luxury reserved for the rich alone, and in winter-time it would be unattainable even by the majority of the rich; but by means of steam we obtain fresh meat, not from the home counties only, nor even from the United Kingdom and the countries bordering on the German Ocean alone, but also from the United States and Canada. So, again, regions so distant as Chili, India, and Australia contribute to our corn supply. Thus the prosperity of English towns now fertilizes the uttermost ends of the earth. Once more, the existence of steamships enabled the starving Irish peasantry to escape from famine and pestilence, and carry their strong arms to the colonization of new American States; as it also saved Germany from the over-population and pauperism too often attendant on an exceptionally high birth-rate. Lastly, railways and steamships enable dealers to dispense with the immense stocks necessary in old days of slow communication, and have thus rendered capital mobilizable. Of the influence of other inventions Whitney's cotton gin is the best illustration. It caused the colonization of the Mississippi valley generations before it would have otherwise been possible, and developed to its present vast proportions the cotton manufacture of Lancashire. But without the railway and the steamship the inventions even of Whitney and of Arkwright would have been only partially fruitful. M. Leroy-Beaulieu and M. de Laveleye seem to hold that these inventions have now almost spent their revolutionizing force. Railways and steamships will of course continue to abridge distances as at present, but they will not thereby alter existing conditions. They will bring this and that region within the reach of commerce; but they will not transform, they will not revolutionize, they will not create a new state of things. So, again, steam will continue to be applied to manufactures; but it will not suddenly multiply a hundredfold the productive power of capital, and reduce many times the cost of production. It will, in fact, preserve what is, not introduce a new force. Of course it is possible that inventions as great as any that have been made may be hit upon in the future. That, however, is a subject on which we can form no opinion. We can only judge of the unknown from the known, and we are absolutely ignorant of the conditions on which depend those great inventions which change profoundly the existing industrial organization. The argument we are examining necessarily, therefore, proceeds on the assumption that, within the brief period it contemplates, say the remainder of the present century, no such great invention will be made. Even so, however, the argument appears to us to be altogether premature. In time it may perhaps be verified, but that time is not yet come. Within narrower limits the argument is less extravagant. M. Leroy-Beaulieu points out that the special direction in which the activity of the past thirty years displayed itself has been the furnishing the world with machinery, the construction of railways, the substitution of steam for sails, and the adaptation of steam to manufactures. That work, he contends, is now nearly completed. In the more advanced countries it is carried as far as it is profitable; in the less advanced the bankruptcies and repudiations of the past few years forbid the extension of much credit for the future; but without credit these countries can do nothing. Hence he thinks that in Great Britain, France, Belgium, and Holland foreign investments will fall more and more into disfavour; that the saving classes will have to content themselves with lower rates of interest; and that, for want of other safe and profitable employment, capital will be applied to an unprecedented extent in the improvement of agriculture—the oldest but still the most backward of the arts. We are not sure that this would not

be the wisest course. But we are not quite so convinced as M. Leroy-Beaulieu that the good resolutions of the present time will last. Repudiation and bankruptcy are not novel. On the contrary, they have been practised for a long time by States, though, we admit, sparingly as compared with recent experience. But such conduct has been forgotten after a time. Further, M. Leroy-Beaulieu goes too far in saying that the work is nearly complete. With the exception of Great Britain and Belgium, perhaps, there is no country in Europe adequately equipped with railways. And a few years of peace and good administration would enable many countries to resume railway construction without imprudence.

The second principal cause of the recent prosperity was the discovery of gold in California and Australia. It operated in two ways. It enabled the gold-producing countries to buy vast quantities of commodities from the more advanced countries; that is, it gave employment to immense numbers of workpeople in Europe in supplying the wants of the miners, and it also employed a considerable number of ships. Afterwards it gave Europe the means of purchasing cotton, silk, corn, tea, and other articles in vast quantities from India and China. Thus it stimulated industry throughout the world, and at the same time it gave a fresh impulse to the spirit of colonization. After a while those who were attracted by gold settled upon the land, and now California is one of the principal corn-exporting countries of the world. The second way in which the discovery acted was to reduce the purchasing power of gold. It appears to be well established that thirty years ago gold was becoming scarce. The growth of wealth and population was rendering the amount of coin in circulation in the world less adequate for its purposes, and was consequently raising the value of gold. The discovery of the mines of California and Australia not only checked that process, but caused the value of the metal to fall. Assuming for argument's sake that the fall has been twenty-five per cent., the effect has been to reduce by one-fourth all debts previously contracted. Thus in the case of our own National Debt a yearly charge of 28,000,000*l.* would really be no greater than a charge of 21,000,000*l.* thirty years ago. Consequently the depreciation of gold has in effect diminished all the national debts of the world, and likewise all the taxation previously existing. Further, it has reduced in the same way tenants whose rents were fixed more than thirty years ago, landowners whose lands were encumbered, millowners who had mortgaged in order to build their mills, and all similar classes. In short, only persons possessed of annuities and fixed incomes and creditors have suffered, while even they, in their capacity of taxpayers, have also been benefited. In these facts we find much of the explanation of the recurring surpluses to which we have grown accustomed, and of the ease with which an unprecedented taxation has been borne by so many countries. But it seems to be established that the effect of the gold discoveries has now been completely spent. The production of gold has not increased for years, and is merely sufficient for the requirements of the world, while there are indications that the demand for the article is likely largely to increase. Here again M. Leroy-Beaulieu sees another reason for expecting a less exuberant prosperity in the future. It is possible, however, that a very slightly increased demand would call forth an augmented supply, and that thus the apprehension is exaggerated.

THE ALMS OF ST. KATHARINE'S HOSPITAL.

WHEN Bishop Grindal certified, at the instance of Queen Elizabeth's secretary, Thomas Wilson, Doctor of Laws, that St. Katharine's Hospital had originally been founded "ad relevamen pauperum et debiliū mulierum," the statement was one of those half-truths which are often the most mischievous of falsehoods. In every ancient religious house of the English Church alms and prayers had been so essentially united as inseparable from the very existence of the foundation, that its order of divine service would have been incomplete and impossible unless its alms, through some channel or other, had flowed for the benefit of the poor. Very likely all this was a violation of the first principles of political economy. Poor-laws, no doubt, are a great advance upon doles at the gates of monasteries, whatever Prime Minister and Postmasters-General may have dreamed in the visions of their youth; but then the dismal science had not been invented in the reign of King Stephen, nor even in that of Henry III. It was absolutely certain that when Queen Matilda, yearning for the repose of the souls of her two little children whose bodies were laid in the cloister of the Aldgate Priory Church, founded and endowed a special house of prayer for that "superstitious use," as later days pronounced it, the poor, in some defined or undefined number, would be benefited by the alms. In what manner this intention was actually carried out is not very clear. The powerful House at Aldgate seem to have pleaded, in justification of their dealings with their ward, the infant Hospital of St. Katharine, that it was necessary to impose upon it "quendam canonicum" of their own, because "fratres illius hospitalis contentiosi et ebriosi singulis diebus solebant esse"; but it appeared to the Bishop of London either that the remedy had not reached the disease, or that he himself had a better specific; and he interposed his episcopal authority vigorously and effectively—"usque ad obitum ejusdem Episcopi, quem in brevi mors dira de medio audivit." The chronicles of the Priory probably regarded the "dreadful

death" of the Bishop as a divine judgment; but the Queen Eleanor survived, and Bishop Henry de Wyngesham was as bad as Bishop Fulke Bassett, or worse. The legal as distinct from the antiquarian history of the existing collegiate church of St. Katharine-near-the-Tower dates from Eleanor's refoundation in 1273, and to this we must go back in attempting to estimate the proportion which the alms of the house were intended to bear to its general corporate revenues. It is almost unnecessary to say that no definite portion of the estates, or charge upon the estates, was set apart for purposes of alms. The doctrine of trusts for uses had not as yet been invented. But in the charter of Eleanor ten beadswomen were established as a permanent and resident portion of the foundation; at least as recited in the charter of Henry VI., the earlier recitals being "clearly imperfect," as the Charity Commissioners explain in their Report of 1866. The copy of Eleanor's charter given in Ducarel's Appendix is so carelessly printed and is full of such gross mistakes that no reliance can be placed upon it; but it appears to be sufficiently established that, besides the ten resident beadswomen, twenty-four poor men, non-resident in the Hospital, were to receive each one halfpenny daily; and that, of these twenty-four, six were to be poor scholars, "qui in ecclesiā capellanis assistent in adiutorio divini obsequii cum hiis (?) pro suo studio commodè poterant vacare, ut eorum maritis et adiutorio cum diligentia uberius respici mereantur de elemosinā hospitalis predicti;" but saving the rights of the Brothers and Sisters to their accustomed allowances. The corrections of the printed text of Ducarel, which may be noticed in the preceding quotation, are made from marginal notes in a copy used and collated by the Charity Commissioners. In addition to the "viginti-quatuor pauperibus," whom we must assume as exclusive of the ten beadswomen (though these last are not named in the earlier copies, while the twenty-four are not named in the later recitals), one thousand poor men are directed to receive an alms of one halfpenny on the day of the death of King Henry III. It is possible that this provision may represent a round number, and merely authorize a dole to all comers on that day, being the festival of St. Edmund "Archiepiscopi et Confessoris"; but the full extent of the original alms of the foundation will thus appear to have been fixed at 20*l.* 6*s.* 8*d.* annually over and above the maintenance of the ten beadswomen. Whatever proportion such a sum may have borne to the total revenue must be taken as permanent under the original intention of the foundress, because the development of the foundation, as its means increased, was directed to be symmetrical in all its parts. But the somewhat contemptuous reference made by the Commissioners of 1871 to the elemosynary charges imposed on the foundation by Eleanor's charter, as "certain small alms," will not bear the test of examination. Eighty years later the stipend of a Chantry priest endowed by Queen Philippa was 10*l.* annually, and her ordinances allow for clothing to the Brothers of the Hospital 40*s.* and to the Sisters 20*s.* each; while the Sisters, in lieu of commons, were to receive 2*d.* daily besides bread, and a "pitantia" of one penny, the latter being doubled on fifteen festivals. No important change therefore in the stipends of the Brothers and Sisters seems to have been made for two centuries, since at the time of the Valor Ecclesiasticus they are returned at 8*l.* each besides their houses, while the beadswomen and the "six poor scholars" represent an annual sum of 46*l.* 15*s.* 0*d.* besides lodging.

From these figures it would apparently follow that the caputal charge upon the revenue, exclusive of the income of the Master, had originally, and till the middle of the sixteenth century, been about the same as the elemosynary, and that these amounts had been stationary, while the estates and possessions of the Hospital had been gradually augmented. We have no means of obtaining an estimate of the income of the Hospital either in the reign of Henry III. or in that of Edward III.; but it was not till a later period that the principal country estates were acquired by various grants, or that the Precinct of the Hospital itself became a property of large annual value. It would seem, therefore, that while the increased value of the estates was gradually raising the Mastership to a position of high emolument and dignity, the other payments were remaining at their ancient level, and represented the original division of the funds of the foundation when the Master was only *primus inter pares*, one of the "four brothers priests" and a comparatively poor man like the rest. The scheme which was sketched in Eleanor's charter for the augmentation of the numbers both of the members of the foundation and its almspeople was never carried out, and at first it probably remained in suspense for want of means. But, as time went on, the great church-building movement of the fourteenth and fifteenth centuries had opened a new channel into which the first overflows of the modest treasury of St. Katharine's were diverted. The "charter" or ordinance of Queen Philippa in 1351 explicitly directs that the whole of the surplus revenue of the foundation remaining after its ordinary expenses had been defrayed should be applied to the completion of the church which a previous Master, William de Erlesby, had begun to build. For the furtherance of this work, "honorifice incepti," not only the existing Master, Paul de Monte Florio, but all his successors, were charged by Queen Philippa with the careful administration of the profits of the Hospital; and "the heads of King Edward III. and his Queen, Philippa, beautifully carved in wood," still remaining in the choir-stalls in the Regent's Park, and again in "stone, greatly defaced, in the porch," bore testimony, till the destruction of the collegiate church in 1825, to the immediate obedience with which these directions

had been fulfilled. The church is said to have been completed about the middle of the fifteenth century by Thomas de Beckington, afterwards Bishop of Bath and Wells, who, as Master of the Hospital, obtained for it the grant of the "Great Charter" of Henry VI.; and from this date St. Katharine's continued in great ecclesiastical splendour as a Royal Chapel closely associated with the Court till the fall of Katharine of Aragon and the troubled times of the Dissolution. Alms in St. Katharine's Church had in 10 Henry VIII. (1518) assumed a very stately form, and though the Guild of St. Barbara, with its long list of Royal and noble members, and its rules and orders, which may be read at length in Strype and his copyists, was not a part of the Hospital foundation itself, it was incorporated within the collegiate church, where all its members were admitted. During the two centuries, therefore, between the reigns of Edward III. and Henry VIII., it may be assumed that the increased wealth of the Hospital was devoted to objects immediately connected with the church and its services according to Queen Philippa's direction, the alms of the foundation and the domestic status of the members of the Chapter remaining on the previous basis; while the "six poor scholars," instead of receiving the alms which had formerly been assigned to them as belonging to a recognized class of chartered mendicants, were now resident members of the foundation as part of the choir of the church, in which, besides the clerical members of the Chapter and the chantry priests, there were, as a paper of Dr. Mallett's shows, "certeyn syngyng mon, clarkes, with syngyng chyldren. And these kept daily service song in the churche"; and he adds that there had been "a commendable hospitalitie kept and a good quere." All this had been destroyed by the Dissolution and the masterships of his two "near temporal" predecessors, "the lord admyrall and Sr. Francis Flemyng"; and Mallett bitterly complains of the ruin and decay in which he found the whole Hospital and its church, and which he tried almost in vain to restore; for "in dede of late I have had the fewer both preistes and syngyng men, because I could not get mete persons for no money." Dr. Mallett's almost abject lamentations in this paper addressed to Queen Elizabeth in deprecation of his own ejection appear in singular contrast to the fierceness with which within his Precinct he sustained, as tradition reported, the character of *mallem hereticorum*; although at one point in this paper such a spirit flashes out for a moment in his angry and contemptuous notice how "the three brethren preistes" had married and were living with their wives in their chambers within the Hospital.

In order to arrive at an estimate of the proportion which, upon the original intention of the foundation, the eleemosynary trusts should bear to the capitular emoluments, it seems necessary, as we have said, to go back to the charter of Eleanor as illustrated by Queen Philippa's ordinance in the middle of the fourteenth century. This will give in about equal shares the stipends of the Brothers and Sisters on the one hand, and the alms of the Hospital on the other; and upon this basis, after providing sufficiently for the income of the mastership and the Domus or management charges, it appears reasonable that any future claim in respect of alms, or, in modern phrase, "charities," should be considered; while among the Domus charges, it must be remembered, was always included the maintenance of the collegiate church. On no point did the inhabitants of the Precinct more strongly insist in the early years of Elizabeth's reign than on the fact that their rents were tithe free, and that the church and its services were wholly maintained for them by the foundation, except that they paid fees "for all buryalls, chrystenings, marriages, four offeringe dayes and clerks wages orderly as other parishes do within the cite of London." It is thus shown to be impossible that any claim in respect of "charities" should be advanced on grounds of right or ancient prescription, so as to extend over more than perhaps one-third of the entire revenues of St. Katharine's. A claim to this extent may with justice be alleged; but "*salvo semper jure Regim.*" The Royal Patroness, after all, is entitled to make such changes in the details of administration as she may think fit within the general lines of the foundation; and, though this discretion does not, as we have already urged, include the right of secularization over an ecclesiastical body, it does clearly include the power of assigning to the capitular and the eleemosynary accounts respectively such proportions of the general revenue or estates as to the Queen may seem best, all precedents notwithstanding. The residents in the East-end of London justly think that the whole of the alms fund of the Hospital ought to be bestowed, at least in the first instance, in the neighbourhood of the ancient site of the Hospital. They represent that the foundation belongs locally to the Tower Hamlets and the adjacent parts of London; and the marked and unvarying interest which the Queen has manifested in the welfare of the East-end poor, and in the prosperity of all the great institutions established, like the London Hospital, to meet their especial needs, supplies proof far more than sufficient that the decision upon these representations may be left with entire confidence in the hands of Her Majesty.

The Royal Commissioners of 1871 drew up a remarkable educational scheme for adoption as part of the future development of St. Katharine's Hospital, on which we commented at the time. A portion of this scheme, which had the merit of being in perfect consistency with the rest, proposed that the handsome and spacious Master's Lodge in the Regent's Park should be converted into a school. The architectural and other arrangements of school-buildings recommended or enforced by the Education Department have

become, during the last seven years, very generally known, and may have by this time reached the Royal Commissioners. But, however this may be, it is certain, as matter of historical fact, that St. Katharine's Hospital, from the days of Queen Matilda to those of Lord Lyndhurst, was never directly an educational foundation at all. Lord Somers did, indeed, order in 1698 that, after certain other extensions of the then existing foundation (of which nothing has since been heard) had been made, a school-house and a schoolmaster should be provided for the Precinct; but before this could be done, if it was ever intended to be done, the Precinct provided a school and a schoolmaster for itself, to which the Hospital subscribed; and which continued from 1705, like other parochial charity schools in and near the city, till in 1825 it shared the fate of the other buildings of the Precinct, and the funds belonging to its trustees were transferred to the trustees of the schools of St. Botolph-without-Aldgate. This school was distinct from and independent of the Hospital; and the existing schools in the Regent's Park are simply an invention of Lord Lyndhurst's, without a previous history of any kind. We have already indicated the relation of the "six poor scholars" of Eleanor's charter to the alms of the Hospital, and the conditions under which they were expected to assist in divine service, which almost anticipated the jealous restrictions on "religious instruction" surrounding the poor scholars of to-day; "*cum à scolâ vacarent*"—when school-lessons did not interfere. No doubt, when they had become a permanent body of choristers, and lived as such in the Hospital, they received some kind of education; and, as they would naturally be taken from the families of the hospital-tenants in the Precinct, it is easy to understand that the "free pure and perpetuall almes of the poor six scollers to be maynteyned" should have been insisted on by the inhabitants as an important part of "the true use of the gyft of the same hospitall." If therefore the Royal Commissioners had proposed the establishment of a choir school in connexion with the collegiate church, there would at least have been some precedent for the suggestion, and some sort of intelligence exhibited as to the nature of the foundation with which they were dealing; but this they were at great pains to avoid. The administration in our own time of the "almes of the poor six scollers" of the thirteenth century would perhaps most happily perpetuate the traditions of the past in the form of scholarships or exhibitions to the Universities, especially if the holders were marked by the distinction—we write in trembling, lest the Zeit-Geist, breathing unsectarianism and competitive examination, should be near us—of being nominated directly by the Queen.

THEATRE ROYAL BEAU-IDEAL.

A PAMPHLET has recently appeared giving "the outlines of a scheme for reforming the stage, and elevating the actor's calling to the status of a liberal and legitimate profession." It is dedicated to the now universal patron, Mr. Gladstone, who, it is mentioned, has given "his kind permission and approbation"; and this phrase has naturally led to the supposition that the eminent person in question had fully adopted the peculiar views as to the stageset forth in this production. The author, however, has thought it necessary, "in justice to that gentleman," to make it known that "Mr. Gladstone is responsible for nothing further than the courtesy of accepting the dedication of the work, and of expressing his sense of the great public importance of the subject, and his hearty sympathy with its purpose." There is certainly an excuse for those who do not understand the characteristic singularities of Mr. Gladstone's language, should they be misled by the expression of his "hearty sympathy" as a form of approbation; but his connexion with this ridiculous pamphlet may now be considered as not committing him to any definite opinion on the subject, which is indeed quite consistent with his usual practice. So small a matter would in itself hardly be worth notice, if it were not that it supplies a remarkable illustration of the tendency of this great oracle, who, to borrow Peacock's description of another example of the same character, "is for doing all the world's business as well as his own, and thinks himself qualified to handle every branch of human knowledge," to identify himself with all sorts of absurd crochets.

The writer of this pamphlet admits, in his odd style, that it would be "invidious, not to say impious, to aver that the terrible conflagration at the Brooklyn Theatre was a Divine judgment to punish the wickedness of the pleasure-seeking victims"; but he is also of opinion that the "recent awful dispensation was decreed for our advantage, and whilst we are taking precautionary measures for the greater security of our places of amusement, and for the protection of human life against similar accidents in the future, we ought at the same time to bestow some serious thought upon the improvement of our theatres" in the way of a "reformation of the morals of the stage." As a proof of the necessity of such a reform, he gives an account of the general personal character of theatrical performers which, while it shows his own ignorance of the subject, also suggests that he too readily accepts idle scandal. "The anomalous social position," he says; "of the actor and actress, even in the present day, will scarcely, I suppose, be denied, and the effect of such a position upon the members of the profession in their loss of self-respect must likewise be acknowledged." In pronouncing this sweeping judgment, he asserts that "it would not be too much to affirm that the theatrical profession, as it is, disqualifies actresses from their proper and natural

sphere as wives and mothers," though he admits that, to a certain extent, the same may be said of all occupations in which women publicly engage. That the effect is worse in the theatrical world is shown, he holds, by the so-called facts that "the home circle has so little attraction for the actress that, in the majority of cases, she prefers an ignominious *liaison* to a wedded life"; that, "when married, the marriage vow is esteemed so light a thing that it is more 'honoured in the breach than the observance';" that "the license of the stage is of itself sufficient to virtually disannul the marriage bond, and, except where the virtue of the contracting parties is very strong, to dissolve all conjugal ties"; and that "the proverbial nonchalance and habitual carelessness of the actress as to demeanour, conversation, and dress when not in front of the footlights are serious stumbling-blocks to a virtuous life and domestic happiness." The theatrical profession is, no doubt, like other professions, a mixed one; and it cannot be denied that there is unfortunately a class of actresses of the kind with which the writer seems to be best acquainted; but his general aspersion of the character of women on the stage is simply a libel of the grossest and most fabulous kind. We do not mean to say that the tendency of an actress's life, as such, is towards an ideal of moral perfection; the conditions of her occupation, in some respects, take her out of the ordinary lines of womanhood; and the excitement, and in a sense the affectation, of her work are not altogether wholesome. But this is true also of other classes of artists, whose devotion to their art is sometimes apt to lead them into deviations from conventional habits and temperament, which, however, do not necessarily involve any approach to immorality. It is true that at one period the women of the stage were too frequently notorious for their loose behaviour; but in modern times the leading actresses have been, as a rule, most respectable persons. Not a breath of scandal ever touched Mrs. Siddons's character; she was, in fact, a model of solemn propriety; and indeed the whole Kemble family, which may be said to have taken to the stage in a body, held a position in good society which would have been quite incompatible with any irregularities of conduct. The same may be said of Mrs. Inchbald, Miss Ellen Tree (afterwards Mrs. Charles Kean), and other heroines of the stage; and it may be said generally of the actresses of the present day, with the exception of the particular class which is referred to in the pamphlet, and which, we are glad to think, is now kept pretty well within bounds, that they are by no means exposed to such disparaging suspicions as the writer, in his ignorance, as we charitably presume, casts upon them. Names, which in such a case we should not think of mentioning, will occur to every one. Indeed those who have any real acquaintance with theatrical society are well aware that the members are, as a body, fully qualified to take their place in the society appropriate to their various grades, and are neither better nor worse on account of their professional duties than other people. Many examples of domestic affection and solicitude, of generous and disinterested charity, of patient endurance of hard and ill-paid work for the support of a family, might easily be cited; and it is ridiculous to say that it is the ordinary rule that "the children of actors and actresses are badly brought up, and utterly unfitted for the responsibilities of real life." In one respect, no doubt, the members of this profession, of both sexes, are liable to suffer from the conditions under which they have to exercise it—that is, the often uncertain incomes which are the lot of too many of them, and the fluctuations of public taste and caprice; but this is their misfortune, and not their fault. On the whole, then, though the general theatrical system of the day may be defective in some important points, it cannot be said that the general body of the profession does not make and keep itself respected in its private relations.

The writer then proceeds to show that the stage might and ought to be organized as an important agent "for the incubation of virtue and for the depreciation of vice," which may of course at once be admitted; but it is evident from his proposals that he is still under the delusion that the stage is at present in the hands of a vicious body which requires a great reform. In order to explain his views, he draws the picture of "The Theatre Beau-Ideal," in which one of the chief conditions of the enrolment of performers is that, "besides being good scholars and good actors, it is necessary that all members of this company should bear good moral characters; that there should be no stigma upon their names; in fine, that they should be above suspicion"; and the security for this is that every candidate before he is accepted must produce "a certificate to his character signed by one clergyman—if possible, the vicar of his parish—and two laymen of good position, who have known the candidate for at least five years." The next step is to pass through a competitive examination in elocution, together with, in the case of women, French, vocal and instrumental music, English prose composition, and history; and for the men, in addition to these, a certain knowledge of Greek and Latin. The "supernumeraries" also are required to furnish proofs of "their respectability, honesty, and sobriety; and to give evidence of their ability to read and write with facility, and to speak their mother tongue with tolerable accuracy." These are the regulations as to intellectual calibre, and now we come to moral discipline. The married men in the company "must not only be living with their wives, but, if their wives are actresses, they too must be members of the same company"; and "unmarried ladies are only admitted with the sanction of their parents, with whom they must reside; or, if they are orphans, with the consent of their guardians, under whose protection they must be living; in the case of widows, the marriage certificate is

required to be produced as one of their testimonials." All the rehearsals at the "Beau-Ideal" are conducted in the presence of the manager, the professor of elocution, and professor of music; the students of the school attached to the theatre may also attend, but no strangers will be admitted to any part of the house at the rehearsals, or behind the scenes at public performances. "Consequently all such events as 'appointments,' clandestine meetings, anonymous communications, and gifts from unknown donors are things unheard of at the 'Beau-Ideal,' and any breach of this rule would, of course, have but one result—namely, dismissal of the offending member." At the same time, "whilst every means is taken to check any approach to illicit intercourse, every facility and encouragement are afforded to honourable attachments by the management," which would thus exercise a sort of paternal, or rather maternal, control. Then there are to be no performances on Saturday night, so as to leave no excuse for invading the Sunday; and new pieces are not to be rehearsed at the beginning of the week, or without due time for preparation, lest there should be a "temptation to study 'parts' on Sunday, to the neglect of a regular attendance at a place of public worship. Moreover, 'by the example of the managers and the professors of the establishment, the members of the company are taught and encouraged to be as attentive to the duties of religion as to those of business.'" The physical and mental welfare of the company is equally taken care of. There are reading-rooms fitted with well-chosen books, baths, and lavatories, for "the refreshment of their bodily and mental powers," whilst in the summer the men have athletic sports, and the women croquet and archery, with picnics, under the strict supervision of the manager, professors, and their wives, which no doubt the members find "awfully jolly."

It is scarcely necessary to point out the false assumptions and impracticable conditions of this funny scheme. In the first place, while it may be admitted that there is no necessary antagonism between religion and the stage when the entertainments of the latter are of an innocent character, and that they ought to be conducted so as to foster wholesome feeling and morality, which ought, indeed, to be always one of the objects of every kind of art, it is difficult to understand why the theatrical profession should be especially expected to make a formal parade of religion. The diffusion of a religious spirit is no doubt essential to the sound constitution of society; but there may be a good picture or a good book without any direct manifestation of that spirit, and so it is on the stage. As a rule, actors and actresses, allowing for their peculiar vocations, which require them to lead in various ways a somewhat different life from other people—such as having to be up late at night, and to undergo an exceptional amount of excitement—are very much the same as the common stock of humanity; and it is unfair to represent them as a low class which specially requires to be elevated. The writer of this pamphlet asks whether "the moral lessons of the drama would not sink deeper into the hearts of the audience if they were well assured that the artists who depicted its scenes themselves led pure and honourable lives"; but he forgets that in other walks of life people are charitably assumed to be leading such lives, unless there is distinct proof to the contrary. Indeed this is the weak point of this reformer throughout—that his mind is possessed with the notion that players are a very loose and immoral set of people, and have to be converted. In regard to the general condition of the theatrical system, there is no doubt ample scope for improvement—as, for instance, in regard to a more systematic education for the profession in artistic articulation and representation of character and emotions; in providing a livelihood for its members of a more liberal and settled kind; and in getting rid of the stupid frivolity, and too often vulgarity, which for the most part stamp the plays and acting of the day; and in encouraging the development of high, refined, cultivated, and really intellectual art upon the stage. There is in this country, at the present day, a general repugnance to throw the duty of regulating public taste on the State, and therefore it is impossible to hope for a revival of anything in the shape of the old patent theatres, or the existing Comédie Française. At the same time it is surprising that, while so much interest is taken in dramatic entertainments as is shown by crowded audiences and increasing amateur entertainments, nothing is done by the wealthy patrons of the art to give it a fair chance of developing itself, and acquiring an honourable public position. This is really the great want of the day; by a moderate amount of expenditure and energy it might easily be supplied, and it is not creditable that the attempt is not made.

INDIAN PRISONS.

AN interesting Report by Miss Mary Carpenter on prison discipline in India has been published as a Parliamentary paper. Miss Carpenter has been four times in India, her first visit having been made in 1866; and her Report shows that, while several valuable reforms have been introduced into Indian prisons since that time, others of equal importance are still unaccomplished. In a letter written to Lord Lawrence in January 1867, Miss Carpenter enumerates the deficiencies which most impressed her during her stay in Bombay and Calcutta. She found in India neither reformatory nor industrial schools; and, as preocious crime is at least not rarer in India than in England, there were many boys in prison who had already become confirmed offenders. In the jails

great attention was paid to industrial work, but any moral effect which might be produced by regular labour was wholly defeated by the want of separate sleeping cells and of any kind of teaching except such as is purely industrial. The license of prison life had a peculiarly bad influence on women. The female prisoners were always together, night and day; they were under the care of male warders, and the combined attractions of a good dietary and freedom from strict discipline deprived prison life of all its terrors. The day of discharge ceased to be looked forward to, and the prisoners constantly returned within a short time of the expiration of their sentences. Miss Carpenter recommended that these evils should be met by the establishment of industrial schools, the introduction of separate sleeping cells, and some provision for education into all prisons, that female prisoners in particular should always be either in separate cells or subjected to proper supervision, and that the warders in charge of them should always be women.

The ten years which have passed since Miss Carpenter's first visit have produced at the last moment an Industrial and Reformatory Schools Act. As this Act was only passed last year, it will be a considerable time before much fruit will be reaped from it. But a reformatory school is to be built near Calcutta, and at Madras the necessary land has been given by one native gentleman, while another has offered to build a house on it. Of course as the Act was still brand-new, the evils it is designed to deal with were still in full force when Miss Carpenter was in India last year. At Poona a portion of the gaol was shut off from the part occupied by adults and called a reformatory. In Calcutta she saw fifty young boys associated together, many of whom had already been several times in gaol. In Madras a boy of ten years of age was in irons and under sentence of imprisonment for life. One result of the absence of reformatories is that the magistrates are very unwilling to send boys to gaol, so that many boys are at large who would be greatly benefited by staying for some time in a reformatory. Considering what Indian prisons too commonly are, it is not wonderful that a magistrate should often think that to let a boy go is a lesser evil than to punish him. As regards female prisoners, Miss Carpenter found that some progress had been made. Everywhere except at Serampore a regular female warder was in charge of the women. But separate sleeping cells only existed at Benares, where the matron told Miss Carpenter that she found them of very great service, as a prisoner could be kept in her cell during the day by way of punishment. It is astonishing that the necessity of separating prisoners at night should only now be generally recognized in India. It used to be supposed, says Miss Carpenter, that the circumstances of the climate and the nature of the inhabitants rendered separation at night undesirable, if not impossible. During her last visit, however, Miss Carpenter found that the opinion of every prison official was hostile to the present system of association in sleeping hours. Why it should be taken so long to get this seemingly elementary fact accepted, it is hard to say. The reason for sending men to gaol is either to reform them, so that they will no longer care to do criminal acts, or to make them uncomfortable, so that they will no longer care to risk the punishment that follows on criminal acts. From either point of view, separation at night is indispensable. During the day the prisoners are engaged in some kind of work, but at night they have nothing to do, and if they are together their time is sure to be passed in comparing histories of former crimes or in planning new crimes. The only chance of inducing a man to think seriously of the career which has brought him to prison, and which, if he does not abandon it, will bring him to prison again, if not to a still worse fate, is to give him a large measure of enforced solitude. If there is anything in him capable of reformation, it will come out when he is left with nothing to occupy his attention or divert his thoughts from himself. Even if he gains nothing from this discipline, he will at all events greatly dislike it. The unrestrained conversation of the twelve hours during which fifty or sixty prisoners are locked up together is the relaxation which makes up for the day's annoyances. Take this away and a prison becomes but a dreary place, with hard work by day and solitude by night. It is almost inexplicable how, under so enlightened a Government as that of India, these commonplace considerations should have been left so long without any practical result.

The explanation is to be found in that poverty which in India meets us at every turn, and accounts for so much that at first sight seems unaccountable. The Government is short of money, and there are other calls on it which, though they may not be more urgent, are at least louder. But, as Miss Carpenter points out, if the theory that association at night "gives rise to frightful crimes, creates and continually increases a criminal class, and greatly diminishes the deterrent influence of imprisonment," is well founded—and it is the theory of every expert in prison discipline—the expense of building separate cells, if it be not a very large one, would soon be covered by the diminution in the number of prisoners that would follow upon a change of system. Nor need the expense be very great. The Hindoo prisoner is a less audacious and a more social being than the English prisoner; and consequently the cells need not be so strong, and ought not to be so completely secluded, as the cells in a well-constructed English gaol. It has been said that it is easier to govern a thousand Hindoo prisoners than ten English convicts. Absolute solitude, such as is enforced in some English prisons, would have, Miss Carpenter thinks, a very injurious effect both on the mind and on the body of a Hindoo. This considera-

tion excludes some of the more costly structures in which the prisoner is unable to see even the warder who has charge of him. At Poona the city gaol is filled with separate cells, arranged in blocks radiating from a centre, each cell having a window near the top of the back-wall, and a door consisting of strong iron bars. There is a verandah running along each block in front of these doors, so that a warder passing along can see what every prisoner is doing. These cells need not cost more than 10*l.* each, while at Hyderabad there was a cell which the superintendent thought well suited to the requirements of the country which could be built for 2*l.* Part of this cost might be saved in other ways. The plan of leaving the prisoners together at night makes it necessary to maintain a stronger military guard than would otherwise be required; and a part of this might be dispensed with if the prisoners were locked up separately, and the escape of one did not entail the escape of any greater number. At Ahmedabad the Government are paid 1,000*l.* a year for a guard of 42 soldiers. Supposing that one-fourth of this number could be spared, the capital represented by the money saved would be sufficient to build separate cells, on the Poona model, for the 450 prisoners whom the prison contains. In many cases Miss Carpenter believes that the existing gaols could be altered so as to separate the prisoners at night, at a very moderate expense. It is plain that, in delaying to make this essential change, and still more in continuing to build gaols on the old principle, the Government of India is actuated by a short-sighted and penny-wise economy.

The question of instruction presents more difficulties. Reading and writing are not very powerful agents in diverting a man from a course of crime, and it is difficult to give directly moral instruction without landing on the forbidden question of religion. The notion that imprisonment is used as a means of proselytism might have a very disastrous effect in India, and apart from religion it is not easy to find either precepts or sanctions that are recognized alike by teachers and taught. Miss Carpenter boldly proposes that education, "with moral instruction," should be given daily by competent native teachers. But the morality of a competent native teacher might not be altogether of the kind to exert a good influence on the prisoners. Still an influence the benefit of which is not altogether beyond dispute seems, on the whole, likely to do more good than harm. Upon all these points Miss Carpenter is anxious that the Government of India should lay down some general regulations to be applied with appropriate modifications by the local Governments. The superabundant energy of which Lord Lytton occasionally gives evidence could hardly be better employed than in drafting these general principles and in recommending them to the consideration of the authorities in each presidency. After making the hearts of Indian Judges to fail them for fear, it would be some compensation if he would show himself equally terrible towards Indian criminals.

THE OPERAS.

THE Opera season this year opened, as many other seasons have done, with the promise of a new tenor who was to combine all kinds of excellences. It was reported that a competent judge had described him as possessing a voice as melodious as Giuglini's, and a method as perfect, with infinitely more dramatic force. Signor or Señor Gayarré's arrival aroused additional excitement because up to, and even after, the date of his first appearance he was announced as a member both of Mr. Gye's and of Mr. Mapleson's company; and of course, when two managers are contesting the right in a new tenor, there must be something very wonderful in him. Without denying that Signor Gayarré has some useful and attractive qualities, it may be safely said that he is not likely ever to recall the days of Signor Mario or of Giuglini, and that, so long as Mr. Mapleson can retain the services of Signor Fancelli, he will be able to exist very well without Signor Gayarré. The new tenor made his first appearance in *La Favorita*, and thus far has done better in that part than in any other. He finds in it plenty of opportunities, well or ill chosen, for displaying the strong and melodious notes which are his chief gift, and which have no doubt considerable beauty, although they are of a baritone rather than a tenor quality. These notes would be more pleasant to hear if they were less often marred by the tremulous delivery which many singers of late have fallen into. When the singer gets into the high tenor register, his voice loses its attractive tone, and becomes hard and thin, which, as it seems to be produced from the palate, is perhaps not surprising. Signor Gayarré is, however, determined to make the most of those notes which are really excellent, and, with too little thought for anything beyond that, is accustomed to indulge in sudden leaps from *forte* to *piano*, and to hold a note for what seems a surprising time until one takes notice of the gasp in the middle of it. To give a general notion of Signor Gayarré's method of singing, it might be said that it is full of what are popularly known as "applause-traps." In the singer's acting there is good intention and some vigour; but he is wanting in dignity, and that he has got a great deal to learn in this respect is evident when it is remarked that he makes absolutely nothing of the great scene in *La Favorita* where Fernando breaks his sword and flings it indignantly at the feet of the king. In the well-known air "Angiol d'Amor," in the next act, Signor Gayarré, besides disfiguring it with the tricks which have been mentioned, took the time far too slow. He has in a marked degree one merit which is by no means too common—that of pronouncing his words with great clearness. The Leonora of Mme. Scalchi is, to our thinking, a far more satisfactory perform-

ance than the Fernando of Signor Gayarré. The singer's fine voice is excellently used throughout the opera, and though she never rises to any towering height of passion, she never misses what should be an effect, and in her byplay as well as in the rest of her acting there is evidence of thought and skill. Mlle. Cottino sings the music of Inez with pleasant fluency. Signor Bagagiolo's fine voice and steady singing are well suited in the part of Baldassare, which makes no great demand upon the singer's acting power; and Signor Graziani's Alfonso has all this singer's accustomed smoothness and dignity. The chorus in this and other operas given at the same house is excellent; but the orchestra at times is terribly coarse, so much so indeed as to suggest that Signor Vianesi has been employing his spare time in conducting a brass band. It may be worth while to point out that the book of the words of *La Favorita* sold in the house contains words bearing only the very remotest resemblance to those which are sung.

Faust has been given at Covent Garden, with M. Capoul in the tenor part. This singer's performance of *Faust* we have frequently criticized, and need now only say that it has improved by becoming less affected. Signor Bagagiolo appeared as M. Maurel's substitute in Mephistopheles, and did his best to act the part, and to invest the heavy tones of his voice with a diabolical sprightliness. Mlle. Smerechi was somewhat overweighted with Margherita. Signor Gayarré's performance of Raoul in the *Huguenots* does not show the singer on the whole to as great advantage as his Fernando in *La Favorita*. The want of dignity in his acting is more apparent, and his alternate tameness and noisiness at important parts of the opera, such as the great duet, are disagreeable. Signor Carpi, who on one occasion sang the part at short notice in consequence of Signor Gayarré's indisposition, gave a better rendering of it, both as regards the loudness of his singing and his acting, which at some points, notably the burst of indignation at the end of the first act, rose to excellence. On this occasion Mlle. Marimon appeared in the part of the Queen, and gave to it all the charm of her sure and brilliant execution. If Mme. Scuderi's acting were equal to her singing as Urbano, it would be difficult to find a fault with her performance. The orchestra in this opera is better than in *La Favorita*, and the chorus is unusually good. Some new and very well-arranged stage business has been introduced in the scene of the *Pré aux Clercs*. But unless a more competent representative of Valentine than Mlle. d'Angeri can be found, the performance of the *Huguenots* at this house cannot be entirely satisfactory. Signor Gayarré has appeared as the Duke in *Truffaldino*, and there his faults were less disagreeable than in Raoul or Fernando. His delivery of "La donna è mobile" was much applauded; but those who remember the thrill of pleasure which ran through the house when Giuglini repeated, with exquisite softness, the phrase "e di pensiero," and contrast this softness with Signor Gayarré's hard and careless delivery of the same passage, will think that the comparison which has been made between the two singers is unfortunate. In the part of the Duke, moreover, Signor Gayarré's use of the vibrato was especially and painfully apparent. Signor Pandolfini, a singer new to the London stage, appeared as Rigoletto, and deserved considerable credit for his good phrasing and generally well-cultivated method of singing. His power of acting, however, was not equal to the demands made upon it by the part, which indeed is one of the most difficult in existence. To indicate that the jester, as M. Victor Hugo has it, "weeps tears of blood beneath a mask that laughs," is a task which is very far from easy; and that Signor Pandolfini has failed in this is no proof that he may not be successful in characters involving less complicated passion. At the same time, in the great scene where the jester supposes that he has caused the Duke to be murdered, the singer might have suggested something more than the emotion which one would naturally associate with a respectable merchant in temporary difficulties. However, perhaps the only singer of the present day capable of acting and singing this part as it should be sung and acted is M. Faure, who has, as far as we know, never attempted it. Mlle. Albani's performance of Gilda had throughout a great charm of grace and simplicity, and her singing in the passage where she is left alone on the stage in Scene xiii. was admirable for its steadiness, its meaning, and its brilliant execution. The stage management of the scene immediately following this, where Rigoletto enters, not seeing the crowd of courtiers, is not very successful. On so large a stage as that of Covent Garden, greater probability might well be given to the action. As it is, one has to make believe very much that the groups filling the stage as he crosses it can escape his attention. The well-known concerted piece "Bella figlia dell'amore" was admirably given; and here, as in concerted music in other operas, Signor Gayarré's voice told with fine effect.

Mr. Mapleson has done well in reopening Her Majesty's Theatre in the Haymarket. Both as regards the stage and the body of the house there is a great improvement upon Drury Lane. The house had to be got ready at somewhat short notice, and this may no doubt account for Mr. Mapleson having for some little time rung the changes upon three or four well-known and not supremely interesting operas, the weight of which, however, was supported by singers of great merit. Lately *Lucrezia Borgia* has been given with Mlle. Titiens, Mme. Trebelli-Bettini, and M. Faure in their accustomed parts, and Signor Carrion, a new comer, as Gennaro. Signor Carrion sang with a good method and with considerable sweetness; but whether from nervousness, or from some other cause, his acting was awkward, although it revealed good intentions, and his stature contrasted somewhat unfortunately with that of the representative of the character with whom he was most concerned.

M. Faure's Duke Alfonso has gained in power and command since last year, and Mme. Trebelli-Bettini has certainly lost nothing of the wonderful art which makes her admirable alike as singer and actress, and gives to her representation of Maffio Orsini exactly the attraction of rockless and generous high spirits designed by the poet who wrote *Lucrezia Borgia*. Mlle. Titiens's *Lucrezia Borgia* we criticized at length—if that can be called criticism which points out no defect—last year, and her performance this year is as full as ever of grandeur and pathos. *Robert le Diable* was given for the first time in the new house on Thursday last. The mounting of the piece is good throughout, and the scene in which there is a sea view is especially well painted. Signor Fancelli appears as Roberto, and the steadiness and absence of affectation with which he manages his fine voice afford a pleasant relief to the tricks and tremulousness of the new tenor at Covent Garden. Signor Foli, who has been too long absent from the stage, plays Bertramo, and invests the part, as far as acting is concerned, with the sombre terror that it demands, while his deep resonant voice gives full effect to the striking music he has to sing. Mlle. Salla, a new singer, appeared as Alice; and upon her capabilities we defer judgment. It is, however, only fair to say that her performance was far from being a failure. Mlle. Valleria as Isabella would do better if she could avoid slurring her cadences. Perhaps the most perfect thing in the representation was the dancing of Mme. Katti Lanner in the scene of the nuns' resuscitation. Grace, agility, and dramatic force were combined in movements which we have never seen rivalled in these days except by Fraulein Böör in Germany and Mlle. Mariquita in Paris.

REVIEWS.

WRIGHT'S HISTORY OF NEPÁL.

THE main portion of this work may be dismissed with a very brief notice. The native history "translated from the *Parbatya*" by two learned Hindus has its merits no doubt, but they are difficult to find, and the search for them may be left to those who have the critical acumen and sagacity to find the one grain of corn in the bushel of chaff—one truth, or an approach to truth, in a wearisome succession of fables. The author of this native history has done his best to give his work an appearance of completeness. Like previous Hindu writers, he goes back to the earliest ages. Passing lightly and modestly over the *Satya yug*, or first age of 1,728,000 years, he enters upon the *Treta*, or second *yug* of 1,296,000 years, of which he is not only able to record several events, natural and supernatural, but to give the exact day of the month on which they occurred. Of the *Dwápar*, or third *yug* of 834,000 years, he has a greater and more precise knowledge. "The *Kirátis* came into Nepal at the 15,000th year" of this age, "and they ruled over the country for 10,000 years. The gods came into the country after the *Kirátis*," and "when 950 years of the *Dwápar yug* still remained the gods came to the decision that it was necessary to appoint a Raja." After this the *Kali yug* commenced, and from that time down to the present, the year 4978 of the *Kali yug*, a long succession of dynasties and Rajas is recorded in full assurance, nothing doubting. The later part of the work comes nearer to the region of reality; but it is very meagre and trivial, a mere jotting down of a few events, to which the utmost stretch of courtesy could not concede the name of history. The war with the British in 1815-16, in which the Nepalese fought well but were totally defeated with great loss of men and territory, is disposed of in this brief style:—"In this reign a war broke out with the British in the Terai; but, depriving them of wisdom, the Raja saved his country. Then, calling the British gentlemen, he made peace with them, and allowed them to live near *Thambabil*." Such is the character of this "history," and it is abundantly manifest that no reliance can be placed upon its statements. But it is well that the work has been translated. Careful study and comparison may possibly find in it some synchronisms, some stray facts which may add a little to our very limited knowledge of Hindu history. Even if it fails to do this it will at least convince the historical inquirer that nothing is to be expected from this quarter. It will extinguish, if it does not satisfy, expectation. So long as such works are locked up in unknown languages they are wistfully looked upon as storehouses of knowledge. The few who have examined them may pronounce them worthless, but nothing short of translation ever brings full conviction to others.

We turn now to the really useful and interesting part of the book—to the "Introductory Sketch of the Country and People of Nepal," written by Dr. Wright. We wish this were much longer and fuller, but so far as it goes it is valuable and welcome. The author lived ten years in the country as surgeon to the British Resident, and enjoyed to the full such opportunities of acquiring knowledge as the jealousy of the ruling powers allows. It has been a settled principle with the Government of Nepal to keep on friendly terms and to act courteously towards our own Government, but yet

* *History of Nepal*. Translated from the *Parbatya* by Munshi Shew Shunker Singh and Pandit Shri Gnananand; with an Introductory Sketch of the Country and People of Nepal by the Editor, Daniel Wright, M.A., M.D., late Surgeon-Major H.M.'s Indian Medical Service, and Residency Surgeon at Kathmandu. Cambridge: at the University Press. London: Cambridge Warehouse. 1877.

to maintain a cautious reserve, and to prevent as far as possible all European intercourse with the country. In this they are more than upheld by the general feeling of the people. From their own point of view they are no doubt right. They have seen the results of European influence in the plains, and wishing to maintain their highland independence, they shut the door not only against all interference, but against travellers and scientific explorers. They have a proverb to the effect that "with the merchant comes the musket, and with the Bible comes the bayonet." Though they are forced by treaty to admit a British Resident at Kathmandu, Europeans are allowed to approach that capital by only one route, and when there they are not permitted to extend their excursions beyond the valley in which Kathmandu stands; so, as Dr. Wright says, "the country, except for fifteen miles round the capital, is as much a *terra incognita* as it was when Colonel Kirkpatrick visited it nearly a hundred years ago." The population of Nepal consists of varieties of two distinct races. The dominant race of Gorkhas, who made their way into the country from Hindustan, speak the *Parbatiya*, or "mountain" dialect of Hindi, and are of the Hindu religion. The Newars, who constitute the largest portion of the inhabitants, speak a Turanian language allied to the Tibetan, profess the Buddhist religion, and have Mongolian features. "The Magars and Gurungs are short, powerful men of Mongolian cast of features. These are the men mostly to be found in what are called the British Gorkha regiments." The army of Nepal is composed principally of Gorkhas, who are essentially a military race. The standing force amounts to sixteen thousand men, which might be raised to sixty or seventy thousand, and they have a very respectable artillery. Dr. Wright thinks that "in their own hills and forests they would fight well, and be formidable foes; but for purposes of aggression it is doubtful if they would be of any use against Europeans." The revenue of the country is estimated at 96,000*l.*, the land-tax being its principal source. In the valley of Nepal the land is well cultivated, and the bulk of the population is engaged in agriculture. Manufactures are few and unimportant. Trade, which is chiefly in the hands of the Newars, is limited. Dr. Wright combats the notion prevalent in India that Nepal and the countries beyond offer a great and promising field for European enterprise. He says, "The people are poor, and have few wants that are not supplied by their own country"; they are, too, "a most penurious and avaricious people. They take every possible advantage of a foreign trader, and unhesitatingly break any bargain if they think they can profit by so doing."

The reigning dynasty of Nepal is of very recent origin. It gained its position by force of arms in A.D. 1768. The fourth Raja in descent appointed his general Bhimsena "to be Prime Minister and protector of the whole country" in 1813, and that general continued to wield the chief authority in the State until 1839, when he was imprisoned and died a violent death, represented as suicide. On his fall the King recovered some of his authority, but contending factions gave him great trouble, and placed the country in danger, until the rise of that remarkable man Jung Bahadur, who ruled the country for thirty years with wonderful ability and success. As for other Orientals who have risen to eminence, a distinguished ancestry has been found for Jung Bahadur. A descent is claimed for him from the Ranas of Chitor and Udupur, the purest and noblest stock in India. But we need go no further back than the year 1843. In that year a dashing soldier named Matabar Singh, nephew of the old minister Bhimsena, returned from exile, and very soon rose to be Prime Minister. Jung Bahadur was nephew of this Matabar Singh, and then held the rank of colonel. Sir Henry Lawrence, who was at the time Resident in Nepal, mentions him "as an intelligent young man, particularly expert in all military matters, but, though young in years, profoundly versed in intrigue." His growing influence alarmed his uncle, and not without reason. The young soldier had won the good will of that wife of the King who had the greatest influence, and to whom the Minister was most obnoxious. On the 18th of May, 1845, the Minister was summoned to an audience of the King, and on entering the council chamber, a rifle-ball from the gallery at the end stretched him dead. The poor weak-minded King, who no doubt was glad to be released from the thralldom of a stronger mind, was induced "to take the credit of the deed." But Jung Bahadur was the assassin, and during the visit of the Prince of Wales, he is said to have exhibited the rifle which he used on this occasion. But this one murder was not enough to open the road to power. A Council of Ministers was called, for which preparation was made. High words ensued, and in the end thirty nobles and about one hundred men of lower rank were shot down. The poor King rushed off in a fright to the British Residency, and when he returned he found that "what little power he possessed in the State was gone for ever." Jung Bahadur then became the real master of the country, and the Rani, who had hoped by his means to secure the succession to her own children, was cast aside and retired to Benares in bitter disappointment. The King chafed under the dictation of his new master, and several attempts were made by open war and secret assassination to get rid of the dictator; but he frustrated them, and in the end the King was deposed. "From this time Jung Bahadur has been the undisputed ruler of the country. The old King is a prisoner in the palace. The present King is kept under the strictest surveillance, and not allowed to exercise any power whatever. The heir-apparent is also kept in a state of obscurity, being never permitted to take a part in any public business, or even to appear at the durbars to which the British

Resident is invited. In fact, one may live for years in Nepal without either seeing or hearing of the King."

Jung Bahadur had six brothers and numerous relations, and he strengthened his position by giving them important offices. He had upwards of a hundred children, and so "the opportunities of increasing his connexions have been tolerably extensive." "The heir-apparent to the throne is married to three of his daughters; the second son of the King to a daughter and niece; his oldest son married a daughter of the King, and has a boy ten years of age; the nephew of the King has married a daughter, and so on through all grades of the higher classes; and, besides his own children, the immense number of his nephews and nieces must also be remembered." But a man's enemies are often those of his own household, and Oriental despots have frequently shown their knowledge of this by sweeping away all their near relations. Nor was Jung Bahadur exempt from the rivalry of his relatives. In 1853, after his return from England, one of his own brothers, the King's brother, and some of the most conservative nobles, conspired to set him aside on the ground of his having lost caste by his visit to Europe. But the attempt was soon crushed. The chief conspirators escaped death through the mediation of the British Government, who consented to retain them as prisoners at Allahabad. The minor offenders received minor punishments. From that time to the day of his death Jung Bahadur ruled without opposition, a convincing proof of his great superiority to all around him. His visit to England in 1850 proved in the highest degree beneficial. He was pleased with the reception he met with, and carried back a lively remembrance, not only of personal favours, but of the immense power and resources of England. He was thus bound to us by a double tie, and when the day of adversity fell upon us he offered and sent his troops to assist in the quelling of the Mutiny. He continued attached to the religion and usages of his country, but the insight he had obtained of a higher civilization produced its effects. His rule was wise and lenient. He revised the criminal code, abolished the punishment of mutilation, restricted capital punishment, and placed great restrictions upon the burning of widows. But in this as in some other matters the prejudices of his countrymen thwarted his liberal designs. "In short," says Dr. Wright, "whatever may be said of the way in which Jung Bahadur obtained power, there is no doubt that he always exercised it for the good of the country, and he is undoubtedly the greatest benefactor that Nepal has ever possessed." His death occurred so recently that nothing has yet become known of the present state of the government of Nepal. Looking forward to this event, Dr. Wright anticipated a succession of struggles for power among his relatives. The prospect is a gloomy one. Dr. Wright's opinion of the rising generation of Gorkha nobles is far from flattering. Many of them have been to Calcutta, but they have picked up more of the vices than of the virtues of civilization. They are idle and luxurious, arrogant and self-conceited; their only amusement is playing at soldiering, and their overweening estimate of their own strength is likely to bring them into difficulties.

The work has been printed at the expense of the University of Cambridge, at the University Press, and is illustrated with many tinted lithographs. The frontispiece is a portrait of Jung Bahadur in full dress, taken from a photograph. Dr. Wright's portion of the book is very interesting, and it appears at an opportune time, for it is quite possible that Nepal may become a source of anxiety and trouble to us.

SWITZERLAND AND THE SWISS.*

WE shall not be astonished if we hereafter learn that this work was originally composed as a holiday task by a young lady at an Evangelical boarding-school. We can imagine the august lady-principal sweeping majestically into the schoolroom on the eve of the vacation, handing each of her senior pupils a set of proofs from M. Carl Girardet's blocks, and requesting the girls to improve their minds during the holidays by illustrating the pretty little Swiss views with a few pretty little chapters upon Switzerland and the Swiss. If these pages had such an origin—and we can scarcely conceive that they had any other—they deserved to be rewarded with faint praise as a fair and painstaking exercise; but they ought to have remained in manuscript; they did not deserve to be set up in type and issued to the world as a book. We have endeavoured to picture to ourselves the fair young author as she first sat down to her task and passed under review the various items of knowledge concerning her subject which had from time to time, by various means, come into her possession. She was perhaps astonished to find that she was already the owner of so considerable a scaffolding; she had simply to make a plan and collect the bricks for her building. A glance at the woodcuts was suggestive of the range of her knowledge. First of all there was William Tell. Then there was sunrise on the Rigi. Next there was Geneva, which suggested Calvin, and Zürich, which meant Zwingli. There were also the Castle of Ohillon and Lord Byron; the Ranz des Vaches; Dr. Caesar Malan and Dr. Merle d'Aubigné; chamois-hunting, the dogs of St. Bernard, the Continental Sabbath, Thorwaldsen's Lion at Luzern, and avalanches. When all these intimations *pour servir* had been put together, it is true that they did not amount to

* *Switzerland and the Swiss: Sketches of the Country and its Famous Men.* By the Author of "The Knights of the Frozen Sea," &c. London: Seeley & Co. 1877.

much, but each one was at least suggestive of a chapter. In order to expand these slight germs into literary substance, and to verify or correct the youthful writer's general notions concerning Switzerland and the Swiss, some amount of study would be necessary. During a ransack in her father's library she happily came into contact with Murray's Handbook (in an old edition, as is evident by her mistakes of omission and commission in treating of the ascent of the Rigi), and also with a History of Switzerland which was issued nearly fifty years ago as a volume of Dr. Dionysius Lardner's *Cabinet Cyclopædia*.

This latter book seems to have been her chief guide. She begins with Lardner, and ends with Lardner. We find the phrase "as Dr. Lardner says" in her introduction, and she closes her very last sentence with the same convincing and clinching observation. It is true that now and then she cites Müller; but as the *Cabinet Cyclopædia* History of Switzerland is mainly an abstract of the work of Johann von Müller and his continuators, she is still guiding her readers by the light of Lardner. We should be glad to know by what line of inquiry she arrived at the fact that Dr. Lardner himself was the author of this history. The volume is anonymous; Dr. Lardner was simply the editor of the series. Although "Dr. Lardner" is her principal authority for the main historical parts of her book, we are bound to say that her principles are too evangelically correct to permit her to follow him whenever she has occasion to treat of the religious history of Switzerland. She then entrusts herself and her readers to the less exceptional guidance of Dr. Merle d'Aubigné. Three of the woodcuts enable her to make three of these improving diversions—the views of the cathedrals of Constance, Zürich, and Geneva. Why Constance should be placed in Switzerland we cannot guess. No Swiss politician, so far as we have ever heard, has suggested that the Confederacy should return to that ancient policy of annexation to which Ticino, Thurgau, and the Vaud, owe their places in the Bund. The author, whose geography is as free and easy as her history is, has generously bestowed the whole Bodensee upon the Swiss. Constance, she tells us, is a city "which stands within a mile of one of Switzerland's largest lakes, the old Boden See, or Lake of Constance." Why she should suppose the former name to be old and the latter now we will not inquire. We are surprised to learn that all the houses in the city of Constance possess the miraculous powers which we thought were confined to the one holy house of Loreto. They must have a capacity of self-locomotion, if Constance has shuffled away from the Bodensee. We should like to know when the city took this strange journey of a mile inland, for when we last saw it it stood within an inch of the lake. M. Girardet's view of Constance has given the author occasion to flee from Dr. Lardner and take refuge with M. d'Aubigné. A chapter headed "Stories of the Brave Old Swiss" is followed by one entitled "Dark Times," which includes a jejune account of the great reforming Council, and the cruel murder of John Huss. Here she exhibits unusual learning, and cites "the historian Clemangis" with much confidence. Indeed this whole chapter is full of marvels. Not only is one reformer turned into an historian, and another taken to be no reformer because he was a Cardinal (D'Ailly), not only is a city moved about like a toy house in a nursery cupboard, but John Huss is burned "on the boasted free soil of Switzerland"; Constance "is a Swiss city"; and a Jesuit named Balbinus (more than a century before the foundation of the Order of Jesuits) certifies to his personal acquaintance with Huss. The author may possibly have caught a glimpse of the fact that the Council and burghers of Constance, as indeed of other Rhine cities, were frequently in offensive and defensive alliance with the Confederate Cantons. Cases of periodical renewal of alliance between the original Switzerland of "The Three Lands" (Uri, Schwyz, and Unterwalden) and the Confederation of Cities (Städtebund) occur often in the splendid official *Sammlung der ältern Eidgenössischen Abschiede*, of which a new volume has been issued within the last few weeks. We find many such in the fourteenth century; in one of the year 1329, extending the alliance between the Forest Cantons and the Allied Cities for three more years, Constance had the priority of signature:—"Wir Rudolf von Gottes Gnaden Bischof ze [not "von"] Konstanz, Wir die Rete und Burger von Konstanz, von Zürich, von Berno, von Lindowe, von Überlingen, von Sant Gallen, von Rafonspurg, und wir die Lantammanne und Lantleute gemeinlich von Uren, von Switz, und von Unterwalden." We need not cite the whole document in which "Wir die Rete und Burgere der vorgenanten Stetten, und Lantammanne und Lantleute der vorgenanten drier Waltstetten" agree to stand fast and true to each other. To call Constance "a Swiss city" on the ground of such alliances would equally justify the inclusion of Mainz or Speyer in Switzerland, or, still more, of Mühlhausen.

The author has evidently gone on learning while she has gone on writing. Unhappily for herself and her readers, she has not learned enough to impel her to tear up her crude manuscript. Soon after she has begun her history, and has told us something of "the first inhabitants of Switzerland," under the guidance of "Dr. Lardner," she had the good or ill luck to come across a translation of Dr. Keller's publications on the Pfahlbauten. This of course necessitated the compilation of a chapter on "Lake Cities," which is fairly put together. After a diversion on the "Chief Features of the Country," in which there is a great deal of reference to "Professor Tindall," she returns with undiminished faith to her old teacher. She was of course compelled to give some account of the struggle of the Confederates against Charles the Bold; but it is with an evident relief and consciousness of didactic ability that

she turns from this worldly subject, and begins to illustrate the woodcuts of Milan and Zürich with a chapter upon "The Apostles of Switzerland." Why Milan is put into the book we do not very clearly see. It is true that it was the see of St. Carlo Borromeo, that his influence on the Catholic Cantons was enormous, that he was the originator of the permanent Papal Nunciature in Switzerland, and that he founded in Milan a seminary for the Swiss Catholic youths, which became a productive factor in Swiss history and politics. But the author cannot be accused of any acquaintance with this busy Popish Cardinal; besides the activity of this hero of Milan did not begin until after the death of the hero of Zürich, or, as our historian prefers to call Zwingli, "the Apostle of Switzerland." We do her the justice to say that she has a conception that there were Christians and even apostles in Switzerland before the apostleship of Zwingli. These earlier apostles appear to have been the long-lost primitive Presbyterians. So at least we gather from the passage which she borrows and mangles from "Dr. Lardner":—"That a church, or rather that churches, existed in the fourth century is proved by the fact that signatures have come down to us of certain bishops or elders of Geneva, Coire, Aventicum, and the Valais." The word "elders" is her own; we took the trouble to turn to her instructor, and we find that "Dr. Lardner" speaks of "Bishops or Presbyters of churches in the Valais, at Geneva, Coire, Aventicum, and elsewhere." The conversion of an old Catholic presbyter of the fourth century into a Presbyterian elder of the sixteenth is a bold stroke of interpretation for a young lady. Perhaps she wishes her readers to infer that Bishop Calvin and Bishop Beza restored to the Church of Geneva its original government. She has a picture of Einsiedeln; but it is employed to illustrate the life of the Apostle Zwingli instead of the life of the interesting Apostle Meinrad, whose influence on Switzerland is still traceable. The story of this hermit's martyrdom by two wandering rogues, one an "Alemannus" and the other a "Rhetianus," as told by the Abbot Berno of Reichenau, would have taught her more of early Swiss history than she has gathered from "Dr. Lardner." Of Ursus and Victor, Felix and Regula, and other reputed founders of the Helvetic churches, she says nothing; Beatus and Lucius, and even St. Gall and the "Scottish" (Irish) Apostles, are dismissed with a line. Probably the author thinks that they were provisionally allowed to introduce a kind of Gospel in order that Zwingli and Calvin might afterwards be raised up to show that it was corrupt. Yet they all deserve some notice from a writer on Switzerland who is dwelling in Britain, if only as the vanguard of the myriads of travellers whom these islands have poured into Switzerland, and as the very earliest British and Irish climbers of Swiss mountains. In the common schools of Zwingli's Zürich the children now read the following passage from Eberhard's *Lesebuch*:—"Einer der Männer, welche unsern Voreltern früh das Evangelium predigten, war der heilige Beatus. Er war in England geboren." Of course we cannot claim this converted Druid, whose Romanized name still remains in the Beatenberg and the Beatushöhle on the Lake of Thun, as an Englishman; nor have we any title to the apostolic St. Lucius of Chur, the King of Britain whom the Swiss expect us to venerate as a fellow-countryman. We imagine that the author has some vague conception that the Helvetians and their Teuton conquerors mingled on equal and amicable terms, like the "Britons and Saxons," and that a Swiss people proceeded out of the former intermixture, as an English people did out of the latter. Although here and there she uses an expression which implies that she has caught a glimpse of the truth, she proves that she has no very secure grasp of it by giving the title "Foreign Rulers" to a chapter which includes a summary of Swiss history between the death of "Charlemagne" and the appearance of Rudolf of Habsburg. Every modern historical writer in Switzerland is clear enough in his conviction that his Teuton forefathers did not amalgamate with his supposed Helvetic co-ancestors. We should like to see some document of Uri, or Schwyz, or Zürich, between the ninth and the thirteenth centuries, in which a Roman Kaiser, or a Zähringen Herzog, or a Habsburger Graf is written as "Welsch" and a foreigner. One of the earliest official self-designations of anything that can be called Switzerland is "Die Eidgenossenschaft des alten Bundes in Ober-Deutschland." King Ludwig the German in the year 853 presented "das Ländchen Uri," with its churches and buildings, woods and waters, fields and pastures, and "serfs (Leibeigenen) of both sexes and every age," as a part of the German land, to the Fraumünsterabtei in the German city of Zürich. Indeed the actual independence of Switzerland, and the final self-loosening of the Confederacy from the Empire, cannot be dated earlier than the fifteenth century. Many old forms and titles expressive of an organic affinity with the Reich survived to a very recent date. The Reichsadler was diligently figured on coins and ensigns and on the gates of towns in the seventeenth century. As late as 1701 the Abbot of Muri was made a Prince of the Empire by Leopold I. One memorial of the old relation of Zürich to the Empire was only abolished in the lifetime of some who are still living. The member of the Council who was delegated to superintend a capital punishment was duly called "der Reichsvogt" until the year 1798.

We have no inclination to pursue our author from the field of history to the fields of theology and manners. Indeed she exhausts herself as historian with her sketch of the life and work of the Zürich reformer, in which she manages to omit any reference to the most important and fruitful contribution of Zwingli

to the subsequent development of the ecclesiastical life of Christendom—the place which he gave to the *Gemeinde*. She takes a glance at Basel and Holbein, and at Geneva and Calvin, and then hurries across the intervening generations until she arrives at the Calvinistic revival in the French-speaking cantons, at Felix Neff, Robert Haldane (a Scotchman “who stands inseparably connected with the dawn of the revival of the Gospel on the continent of Europe”), Cæsar Malan, Merle d’Aubigné, and the *Eglise Libre* in the Vaud. We should add that she interposes two short interludes between Calvin and Haldane; one upon “Remarkable Men of Later Times,” and the other upon “Alpine Climbers.” The closing chapter upon “Switzerland as it is” ought to be entitled “Switzerland as it is not.” It is a heap of ignorance, confusions, errors, and random guesses. But we suspect that all these faults will be condoned by the class of purchasers at whom the book is aimed. The egregious confusions which are combined in the following passage will alone be sufficient to procure a warm recommendation from the Evangelical press:—“Intercourse with the French, however, which was considerably increased after the Revolution, did the Swiss harm in many ways, and especially in lessening their national regard to the Sabbath.”

PATERSON ON THE LIBERTY OF THE SUBJECT.*

THE appearance of Mr. Paterson's Commentaries almost at the same time with Sir James Stephen's Digest of the Criminal Law supplies the material for a comparison which can hardly fail to be instructive. Covering to a great extent the same ground, and professing in a general way similar ends, the two books seek to attain their purposes by methods so different that they may fairly be called opposite. They are, curiously enough, published by the same house, and the publishers' name alone would show that both Sir James Stephen and Mr. Paterson address themselves to a wider circle of readers than is usually contemplated by the authors of legal text-books. A part, at least, of the task they have set before themselves is to make English law more intelligible and less repulsive to educated Englishmen who are not lawyers; and the success they respectively meet with will go far to show whether a diffuse and popular manner of statement, or a concise and exact one, is the better way to compass this most desirable end. Sir James Stephen has adopted the form of the Indian Codes, already used by him in his Digest of the Law of Evidence. He states the substance of the law in general propositions which are intended to be as verbally exact as possible, and adds specific instances—generally taken from actual decisions—to show how the general rules are applied in practice. Mr. Paterson, on the other hand, departs in the opposite direction from the accustomed style of English text-books by giving his Commentaries the air of a literary disquisition, and introducing a great deal of miscellaneous and collateral matter which can be called illustrative only in a rhetorical sense. Sir James Stephen's references are confined, with few exceptions, to the Reports and Statutes, while in the compass of a few pages Mr. Paterson introduces us in turn, with impartial and unwearied versatility, to Moses, Manu, Plato, Montaigne, Montesquieu, Burke, Bentham, and Stubbs, besides not infrequent excursions into general history and voyages and travels. Mr. Paterson has done his work with great industry and ability, and we see no reason to doubt that he has produced as good a specimen as can be produced of that which, without meaning any disrespect, we must take leave to call the gossiping method of legal writing. The public have the choice very fairly put before them. For our own part, we do not believe that a so-called popular treatment is the fitting instrument to make the knowledge of law really popular; we believe, on the contrary, that the more exact and scientific the treatment, the more acceptable it will be to people who really want information. It may be that in course of time a second Blackstone will produce another work on the laws of England which shall combine the weight of Blackstone's legal authority with his elegance of literary form. But it does not seem to us that such an undertaking will be either desirable or practicable until great improvements have been made both in the substance and in the exposition of the law. The pressing need of our own time is to get the law consolidated and set in order. Accuracy must come for the present before elegance, and even before popularity. Mr. Paterson himself has some very just remarks on this topic; and he dwells on the point, which cannot be too much dwelt upon, that the question is one which, though it seems to concern lawyers in the first place, is really of less concern to them than to the public at large. He also puts in a plea for lay justices of the peace:—

Not only are the subjects of the realm entitled to have some care taken, that they should have reasonable means of knowing the law, but there are thousands of justices of the peace constantly at work applying that law and enforcing it; and as to them, some consideration is pre-eminently due. They are not only left, like the rest of the community, to find out the law as best they may, but often to pay the costs of mistakes which they make from time to time, and most of which arise from the confused state in which the law is found. And as they act gratuitously, and discharge important duties, which save the nation a great expenditure, it might be expected that some more precise and useful guide than copies of isolated acts of parliament would be presented to them.

We have reason to know that the want of such guidance is

keenly felt by some justices who give much more thought and labour to the study of their duties than country magistrates are credited with in popular opinion.

We may thus claim Mr. Paterson as an advocate of scientific exposition, and our regret is the greater that he has adopted a loose and uncritical method for his own work. His book presents, indeed, a definite arrangement, founded on a definite theory; and that is still rare enough in law-books to count as no small merit. But his outline is overloaded, not to say obscured, by his constant diffuseness; and, although there is little positive error in his statement of the law, there is much vagueness, with some grave oversights, and a good deal of inaccuracy in collateral matters. The result amounts, we think, to conclusive proof that prolixity does not secure, even in expert and laborious hands, that completeness of detail which a more concise treatment is supposed to be incapable of attaining.

Mr. Paterson begins with an Introduction in which he discusses the classification of law, and to a certain extent the general notions which are common to all its branches. He disapproves of the definition of law which is now the classical one in this country—namely, Bentham's as developed by Austin—on grounds which seem to us inadequate. First, he says that law does not prescribe a course of conduct, because “a course of conduct includes the great bulk of man's actions.” This is surely to do violence to language. “A course of conduct” is not the whole course of conduct, and no such thing is meant by Austin's definition. There may be a definite course of conduct in particular relations which is a very small part of the whole of conduct. The rules of cricket, for example, prescribe a course of conduct for people who play cricket, and for so long as they are playing it. So the Rules of Court prescribe a course of conduct for people who bring actions, and for so long as their proceedings continue. More generally, the law of the land prescribes a course of conduct for all citizens, in so far as their actions fall within the range of the law. Nor is it easy to see why a course of conduct may not consist in forbearances as well as in acts. Moreover, the words objected to are not a material part of the definition. Mr. Paterson's other objection is that the definition “assigns no specific purpose to law”; this, however, implies a misconception of the nature and purpose of definitions. Mr. Paterson seems to be in search of a definition by which unjust laws should be no laws at all. He proposes the following:—“Law is the sum of the varied restrictions on the actions of each individual which the supreme power of the state enforces, in order that all its members may follow their occupations with greater security.” This is not definition, but rhetoric; it is a loose restatement of Bentham's and Austin's leading conception, adorned with a piece of doubtful surplusage. Mr. Paterson then works out his own theory of classification, which gives the following divisions:—

I. SUBSTANTIVE LAW.

1. Security of the person.
2. Security of property.
3. Security of marriage.
4. Security of public worship.
5. Security of thought, speech, and character.
6. Security of contract and business.
7. Security of foreigners.

II. ADMINISTRATIVE LAW.

8. The Judicature.
9. The Legislature.
10. The Executive Government (including local self-government).

As we do not very much care for classification for its own sake, we will not stop to criticize this scheme. It has the merit of not breaking up, as some proposed divisions do, the established titles of property and contract; on the other hand, it mixes up civil and criminal law, with an entire disregard of both custom and convenience. The actual subject of Mr. Paterson's book is his first division—Security of the Person.

The next chapter contains, in the guise of an explanation of terms, a sort of general introduction to legal notions. There are some rather curious observations on the Social Contract, which Mr. Paterson appears to regard as a fiction, but as being indispensable even after it is seen to be a fiction. Some way further on it is quietly stated that “the English common law was chiefly based on the Roman law,” a fancy of which we had supposed Mr. Finlason to enjoy the monopoly. Presently we find a not immaterial slip:—

If any man assails and ridicules some leading doctrines of the divine law specified in a statute of William III., in such a style as to show that he is not arguing or reasoning honestly, but intends to insult and revile the common faith of the majority of his fellow-subjects, he commits a criminal offence by virtue of such statute.

The qualifying words “in such a style,” &c., are unauthorized. The statute is positive and unqualified; whoever denies (not “assails and ridicules”) certain propositions is liable to the specified penalties, which are so monstrously oppressive that it has never been attempted to put the Act in force. Whether some such qualification as that given by Mr. Paterson applies to the offence of blasphemy at common law is a distinct question.

If we turn to Mr. Paterson's treatment of a definite topic, such as Homicide, we find a great deal of curious information in the footnotes about Thugs, Sioux Indians, Kaffirs, and the Salic Law; but we do not find in the text any very clear exposition of the law of England. Mr. Paterson seems to expect his readers to find their way through the intricacies of the definition of murder with a very moderate amount of guidance. There is only the mildest suggestion of criticism on the confusion which has been pro-

* *Commentaries on the Liberty of the Subject, and the Laws of England relating to the Security of the Person.* By James Paterson, Esq., M.A., Barrister-at-Law, &c. 2 vols. London: Macmillan & Co. 1877.

duced by the unlucky words "malice aforethought," and there is no explicit statement at all of what the law really is at the present day. Sir James Stephen's account of the law of Homicide is contained in about a dozen pages; Mr. Paterson's (after allowing for extraneous matter) fills about fifty. Yet Sir James Stephen gives in his far smaller space not only much more accurate information, but much more in quantity, than Mr. Paterson; and a person in search of definite knowledge about the law of England—say a foreign lawyer seeking to compare our system with his own—could not for a moment hesitate in his choice between the two books. Again, the extremely important question how far unsoundness of mind excludes criminal responsibility is slurred over by Mr. Paterson in two vague paragraphs in widely separated chapters, from neither of which could a reader unfamiliar with the matter even discover that there is any difficulty about it. Sir James Stephen gives it a distinct and conspicuous place in the chapter of "General Exceptions," showing precisely how much is already defined as the law now stands, and how much remains doubtful. We will not dwell on the smaller details which have caught our eye. It is a little surprising to see a learned writer of the present day treating Minos and Lycurgus as no less historical persons than Justinian, the laws of Manu as an actual and not an ideal code, and the *Cyropædia* as real evidence of ancient Persian institutions; but these things are trifles, and beside the purpose of our criticism. Our object is to call attention not so much to the execution as to the conception of the works which we have contrasted. We have not drawn the contrast in order to show that Sir James Stephen has done his work well and that Mr. Paterson has done his badly; the point is that Sir James Stephen has chosen the right way of setting forth his subject, and Mr. Paterson, as it seems to us, a mistaken one.

LIGHTS AND SHADOWS OF SPIRITUALISM.*

MR. HOME'S *Lights and Shadows of Spiritualism* is a work which has two chief objects. First, Mr. Home wishes to show, by the evidence of history and the general assent of all ages, that there is "something in" what is called Spiritualism. Secondly, he proposes to discover the frauds of modern mediums, and to make it manifest that, while this and that practitioner are "the shadows," he, Mr. Home, is the "light," or one of the lights, of Spiritualism. The author is perhaps most successful when he is investigating the shady side of modern necromancy. He carries us completely with him when he divulges the secrets of the "cabinet," and shows how impostors conceal the light tissue or paper dresses in which they afterwards appear as "materialized" ghosts. We could not wish to have the absurd credulity of believers more severely censured and the iniquity and avarice of "mediums" exposed with more scathing criticism. All this is very well; but it does not harmonize with some other parts of Mr. Home's book. We shall take his historical sketch of the supernatural first, and point out a few weak places in the argument.

A scientific history of magic and of its relations to nascent science and to religion has still to be written. In very primitive times, as Mr. A. C. Lyul, a most clear-sighted student of Indian folklore, has shown, the sin of the witch or wizard is indeed "as the sin of rebellion." The witch attempts to obtain certain desirable results by the processes of rudimentary science, mixed up with the evocations of demons discarded by the religion of the priestly caste. Consequently, the eternal quarrel between science and religion begins at this point. But in certain countries, most notably perhaps, as M. Lémontant has remarked, in Assyria and in Etruria, magic has held a lofty and recognized position by the side of religion. Much of magic indeed is the remnant of older and of obsolete religious rites. Much more is the earliest effort of science guided by the crudest metaphysics; while a third element in magic is the exercise of the obscure forces vaguely spoken of as mesmerism and clairvoyance. Mr. Home has made no attempt to trace in a scientific way the growth and the blending of all these currents. He seems to have picked stories at random out of Howitt's *History of the Supernatural*, and has chiefly chosen those which display the lively belief of men in a possible intercourse with spirits. Spirits, good or bad, he says, have swayed all the history of the world. The wickedness, as he holds, of the Chinese in America is due to the fact that "guardian angels seem for a space to have abandoned them." Human action, in short, is only the reflex of spiritual action, and yet Mr. Home has no patience with believers who plead, in excuse of mediums detected in fraud, that "low" and "undeveloped" spirits are to blame. Of course we entirely agree with Mr. Home that a lying knave is a lying knave, and there is an end of it. But if he really holds that the Chinese are immoral because they listen "to the whispers of demons tempting to evil," he might logically extend the same excuse to the personators of Katie King, to M. Bugnet, to Dr. Slade, and all the other baffled humbugs of the period. As to the scholarship of Mr. Home's sketch of "Ancient Spiritualism," it is quite beneath contempt. We did not expect him to examine the theory of Mr. Tylor, the animistic scheme which shows how the facts of dreams, trances, and shadows force on savages the opinion that "the Mænes are somewhat." That doctrine is passed by in silence, while Mr. Home tells us how "King Rhampsitimus [sic],

the magi of Egypt described to Herodotus," played dice in Hades. Shortly afterwards we have the quaint Greek quotation 'Ουρεας Πάν Τεθνηκε. It is useless to ask for references; and we must hunt at random through Ammianus Marcellinus for a very good story about a small table used for divination, and constructed with ceremonies like those used by the Chinese in making their planchettes. This similarity in practice marks magic in all ages and all over the world, and is also a note of all ghost stories, ancient and modern. The question is, How far has the extraordinary uniformity in the human spirit produced a corresponding uniformity in delusions? or, again, is it possible that a uniformity of real experience is the cause of the sameness in tales of apparitions? But this does not interest Mr. Home. He gives the orthodox account of the cure of Pascal's niece, and does not contrast Sainte-Beuve's sceptical criticism, which, whatever it may be worth, should not be omitted. It never occurs to him that Wishart's prophecy of Cardinal Beaton's death was founded on actual knowledge of the plan of the Cardinal's enemies. He does not seem to be aware that the Lyttelton ghost has fallen to pieces in the friendly hands of the Rev. F. G. Lee. Then Bunyan's "miraculous preservations" from death were nothing more supernatural, it has been said, than the fact that Bunyan chanced not to be killed in a battle at which he was not present. In short, a real amateur of ghosts, and a person who has devoted some little care to this charming topic, will be shocked at Mr. Home's casual way of accepting evidence. A man should not commit himself to anecdotes about the transfiguration of Iamblichus without an accurate acquaintance with the facts which Mr. Home does not possess. Is he really not aware that "Iamblichus, though not given to laughter, laughed at this story"? It is illogical of him, after printing his farrago of poorly told and unsupported ghost stories, to rebuke the credulity of the believers in John King and the volatile Katie.

After showing himself capable of believing almost anything, Mr. Home, in the second part of his work, shows where he draws the line. He cannot endure sciences held in the dark; he has a lively scorn of "materialized" spirits which come out of "cabinets," talk profane nonsense, and pinch the legs of the devout. Mr. Home holds, and we entirely agree with him, that all this sort of thing is impudent imposture. The modern spiritualist, he says, is a pilgrim "through pleasant meadows," and he is much struck by the verdure, the refreshing greenness which surrounds the wanderer. On one occasion he was present when a mask was held up by an impostor at the window of a "cabinet." "I called the attention of a credulous spiritualist beside me to the empty and eyeless sockets. His reply came promptly and with a certain triumph—'The dear spirits have not had time to materialize the eyes.'" This is only a specimen of credulity, ingenious in its folly, which every one who has known spiritualists and listened to their arguments will recognize. Every hypothesis is accepted by these people except the only natural one, and the only one for which general experience vouches. We do not remember to have heard of one single instance in which the speculators seized and held a "materialized spirit" which did not prove to be the medium. The faithful then asserted with one voice, first, that the medium was walking in a trance; next, that he was possessed by dishonest spirits; next, that the spirit had borrowed the flesh and bones of the medium as material for the exhibition; lastly, that on this one occasion the medium was cheating, but that, as a rule, he was the soul of honour, and must by no means be suspected in future. "Mediums who have been caught cheating are still tolerated in the movement," says a correspondent of Mr. Home's. Mr. Crookes, in a letter printed here (p. 183), warns Mr. Home that "mediums have the reputation of being very jealous of one another, and consequently any accusations which may be brought by one against another are explained away in this manner. And even when two partners quarrel, and one makes a clean breast of it, or when one medium makes a confession of fraud, and explains how it is done, very few thoroughgoing spiritualists will believe them, but will rather call in the agency of bad spirits, trance, &c."

In spite of these warnings, Mr. Home has compiled a melancholy collection of the frauds, blasphemies, and follies of the people who seek after a sign, and of the prophets who help them to what they want. Mr. Home himself likes an honest sceptic—honesty anywhere must be refreshing in these pursuits; he agrees with Mr. S. C. Hall that Spiritualism is "in a sad state of disorder"; and he brings together stories of American credulity which surpass what one could have imagined of the mental state of the Weddahs of Ceylon or of the Andaman Islanders. The performances of the prophet Harris and the prophet Scott showed that these persons were well aware of the weak places of their countrymen. American credulity seems to start from a basis of Puritanism, and of fervent, though undisciplined, belief in machinery and in the bigness and in the destinies of the United States. At a place called Mountain Cove, Messrs. Harris and Scott, according to Mr. Home, made such good use of their countrymen's weakness as to get themselves accepted for the Two Witnesses of the Apocalypse. A more extraordinary and disgusting mixture of superstition and vulgarity was consummated at a place called High Hook, in Lynn, Mass.; but Mr. Home's work must be consulted here by the curious. In attacking the dishonest medium Mr. Home sometimes ventures to deride the English of the false prophets. A person who invented Rhampsitimus, and who says "To adopt to this writer the language he huris at others" (p. 259), should be careful not to attempt verbal criticism. Mr. Home writes rather better than his rivals in

* *Lights and Shadows of Spiritualism*. By D. D. Home. London: Virtue & Co. 1877.

mediumship, but that is the best that can be said for his style. He very properly denounces spirits who pretend to have recognized in English shops the diamonds they wore when they were Persian princes, and who request believers to present the said diamonds to the medium. He very appropriately quotes Serjeant Cox's exposure of the devices of lady mediums who conceal spiritual raiment of muslin in their drawers; "nobody seems to have thought of the drawers." But we cannot agree with Mr. Serjeant Cox when he calls Spiritualism "the greatest and the grandest mystery that can engage the human mind." And when Mr. Home leaves the shadows of Spiritualism—the performances, that is, of his rivals—and comes to the lights of Spiritualism, his own adventures, we are no longer so much interested. We don't believe in the ghost of the old lady in grey silk who complained to a medium that another coffin had been placed upon that which contained her mortal remains. We are not convinced that the shade of a little girl called Stella consoled her bereaved mother by writing her own name on her boots (pp. 400-402). This may be the "higher aspect of Spiritualism," but it is not a very lofty aspect at the best. Mr. Home, who likes an honest sceptic, will pardon our hesitation. We don't know the lady whose little girl writes her name on boots; we never even saw the boots—the "light summer ones"—in question. When the clever party who "run" John King, or when the author of *People from the Other World*, write their books about Mr. Home and Stella, then we shall have materials on which to form an opinion. In the meantime we can imagine nothing more desirable than this burning zeal for truth in mediums. The more they expose each other's little failings the better for "the greatest and the grandest mystery that can engage the human mind." Opinions very like these have been advanced by "the eloquent pen of Hudson Tuttle." Mr. Tuttle bids mediums welcome "tests," and weed out suspicious characters from their band. As we have never yet heard of a medium above suspicion, or of a case in which "manifestations" did not dwindle as "tests" increased in stringency, it is natural to expect that Mr. Tuttle's pen will soon have to exercise its eloquence on some other topic than Spiritualism. Mr. Home himself seems to be in a very promising condition. When once he has got rid of his belief in Stella and his other "lights," the shadows will flee away, and he will hold exactly the same opinions about this dreary matter as other sensible persons.

HILLEDEN ON THE MOORS.*

LIKE *My Home in the Shires*, and others of Miss Kettle's novels, *Hilleden on the Moors* may fairly be called a "Romance of the West Riding." That is to say, there is more of the romantic and melodramatic in it than we are accustomed to meet with in the fictions of the day when their scenes are laid in bustling England. The story, in parts, rather reminds one of the style and manner of Mr. Harrison Ainsworth when he gets among ancient halls, castles, and manor-houses in the days of gunpowder treasons and the civil broils. In parts, on the other hand, it is eminently practical, so we have the variety and the different effects that come of perpetual contact. *Hilleden* itself is thoroughly prosaic, and its citizens are altogether given over to business. It lies in a picturesque country among great deposits of coal, where smoke goes up from hundreds of furnaces and chimneys; it is blessed with public gardens and institutes, and all the advantages provided by the liberality of a rich municipality and prosperous townfolk; and Mr. Robert Marsden Kirby, who may be said to be the hero of the tale, has made a great fortune in it, which he spends magnificently. Mr. Kirby has sunk in the soil the money he made in his workshops; he has been adding field to field and farm to farm, till he has annexed the greater part of the domains that once were owned by the house of De la Hoste. But, side by side with this able and well-to-do Mr. Kirby, the embodiment of enterprise and respectability in broadcloth, with thoughts that are busy over his ledgers, we have the eccentric Sir John De la Hoste, the present representative of his decayed race. Although he lives under the shadow of the heavy *Hilleden* smoke, Sir John, in his tastes and surroundings, reminds us of the wizard Lord Gifford in *Marmion*. Not that he had precisely "dire dealings with the fiendish race," but his habits were peculiar for the nineteenth century, to say the least of them. Although he had lived hard and fast in his youth, so that dissipation had left its traces on his noble features, in the decline of his years he had turned to literary pursuits. In fact, we are given to understand that in the condition of his banker's account an occasional cheque from editors and publishers was exceedingly welcome for household expenses. But he turns night into day, and rises at untimely hours to rummage among his book-shelves on a sudden inspiration, and makes his lovely and dutiful daughter the slave of the lamp like himself. In consequence of the father's misanthropy, the pair hold themselves aloof from society, and the old "hawk" or "Wizard of the Clough," as Sir John has been dubbed among his neighbours, has a habitation in keeping with his fantastic eccentricities. It is "a grim, grey tower, dark even in sunlight, rising over the moorland"; within are dark oak-floored passages and winding staircases, while the light and air struggle in with difficulty through narrow windows draped in masses of ivy. Student as he is, the baronet spends most of his time, in "rain or shine, in

wind or storm," on the flat platform at the summit of the tower. It is his way to receive his guests there, using the privilege of his rank and infirmities to keep his seat; and, like a mediæval baron, he has a little foot-page, who is trained to answer to his signals, and promptly executes his behests. Sir John's disposition is as disagreeable as his bearing is offensive; he is sarcastic and malicious, not to say malignant; and, moreover, there is something more than a suspicion as to his honesty; for he is believed to have appropriated property that should really have passed to another. In fact, he is one of those heroes of fiction whom we should rather expect to find tenancing a robber castle on the Ithine and figuring in a German legend of the middle ages than settled within a short ride of a thriving industrial town, and serving probably on the commission of the peace.

But, *roué* as he has been, and reclusive as he is, the baronet has a sharp eye to the main chance, and makes it a rule never to throw away an opportunity. He finds it convenient to renew his acquaintance with the family of Mr. Kirby, who indeed is a distant connexion by a marriage which originated a feud; and thus the mystery that looms over the Clough and its lord is made to throw a certain romantic tinge over the general course of the story. In the story there are three pretty and marriageable maidens with plenty of pleasant love-making. There is Mary, the "sole daughter of the house and heart" of Sir John De la Hoste; for he really loves his child, though he has an odd way of showing his affection. There is Amelia Kirby, who is to share with a brother the rich succession of her wealthy father. And there is Nina Davenport, a niece of Kirby's, who has good looks, like the others, in a lighter style, with more lively manners; although, unlike them, she is indifferently dowered. Some family questions of succession apart, how these three young ladies are to be mated is the real excitement of Miss Kettle's plot. There are four lovers more or less impassioned, two of them young and a couple of them elderly. Love-making comes naturally enough, of course, to young Rupert Kirby, the rich manufacturer's son; nor are we surprised that Herr Karlen, a manly and handsome German, who has filled a responsible place in their establishment, should show himself susceptible to English charms. Karlen, who is noble by birth, though his poverty has compelled him to stoop to trade, represents the foreign element which Miss Kettle loves to introduce. But we must say that the somewhat senile attachments of Sir John De la Hoste and Mr. Kirby strike us as bordering on the humorous; for each has set his heart on the daughter of the other. The story unfolds itself in a lively rivalry and an intricate game of cross purposes. Karlen has fallen overboard and ears in love with the chilly and calculating Amelia, who at first inclines to reciprocate his feelings. Young Rupert Kirby, who hardly knows his own mind, thinks he merely likes Nina as a cousin; and there are some pretty scenes where she tries to hide her feelings when they are wounded by the thoughtless frankness of Rupert's brotherly manner. Circumstances conspire to make Karlen happy, had Amelia only consented to smile on his suit. But Sir John De la Hoste, who has come into the field, sets himself to succeed, and succeeds accordingly. He uses his experience and takes advantage of his fatherly years, first, to compromise the friend of his daughter, and then to wring a promise from her. We hardly know whether the lady or the gentleman shows to least advantage; for, dazzled by her elderly admirer's rank and his imposing manners, Amelia throws over her German lover in the most cold-blooded fashion. However Karlen, after passing through a period of anguish and a dangerous illness, is consoled with the hand of Mary De la Hoste, and, as we should have said, has every reason to congratulate himself on the change. Mr. Kirby, who has gradually given up his designs on Mary, mates himself with a lady who is much more eligible in point of age; while his son makes the merry Nina happy, as we have all along foreseen. Many of the episodes in the wooings that we have adverted to so rapidly are worked out with much feeling and delicacy. The grave and stately Mary De la Hoste is made as fascinating in her own way as Nina Davenport in hers; and both Von Karlen and Rupert Kirby ought to be happy men. But we cannot resist a strong impression that stress of circumstances must have forced Miss Kettle's hand as she penned the story; that her natural benevolence of heart became too much for her, and that she yielded to a kindly temptation to make all her characters happy. For even Amelia De la Hoste, instead of being doomed to a life of splendid misery in the clutches of the old hawk of the Clough, finds in him an illustration of the time-honoured maxim, that a reformed rake makes the best husband; and the entire reformation of the loose-principled Sir John is a proof that it is never too late to mend. He is most exemplary as a husband in his second nuptials; while, when his daughter is reunited to the young step-mother who had formerly been her schoolfellow and friend, she sees "the best promises of Amelia's childhood fulfilled. From that fair brow and pure cheek all vanity and pretension had fallen. The softened light in her eyes shone serenely clear; the low sweet tones of her voice rang warmly and truthfully."

Miss Kettle evidently relies on frequent and complete transpositions of her scenes to keep up the excitement and interest of her story; and the life of the Continent has such a charm for herself, that she fancies it must be a spell to conjure with among her readers. But, in truth, the digressions in which we are made to follow Karlen and the German armies through the courses of the French invasion are an artistic mistake, and they merely serve to interrupt the continuity of the actual story. It is all very well that Karlen should go abroad when he does. The danger to

* *Hilleden on the Moors: a Romance of the West Riding*. By Rose Mackenzie Kettle, Author of "The Mistress of Langdale Hall," &c. James Weir. 1877.

which he is exposed, the glory with which he covers himself, and the risks to which he exposes his life when he hurries back wounded to England on the report of his lady-love's infidelity—all these different circumstances have their distinct bearing on the plot. But the details of the struggle on the Spichern heights, of the fighting around Metz and the capitulation of Sedan, are neither new nor very true. They read like passages from volumes of collected war correspondence, and they are utterly irrelevant to the development of the story. We may add, by the way, that Karlen's lovelorn behaviour hardly commends itself to us as in strict keeping with his reputation as a patriot and a gallant soldier. He comes over to see after his lady-love while his comrades are still in the field, which might possibly be excusable, as he had obtained leave of absence to recruit himself. But the making a very prolonged convalescence a pretext for not going back again seems to us to look suspiciously like "malingering"; and although he made an excellent marriage, and slipped into a lucrative partnership at Lillesden, we should imagine that his conscience must have given him some twinges. All things considered, however, we may fairly praise the story; although it seems to us that it would have gained considerably in realism had some of the incidents been cast in a more modern shape, and had the language in places been somewhat more commonplace.

L'ART.

THIS formidable-looking journal of art, published once a week in Paris, received in our columns a welcome on its first appearance. The difficulties, artistic and literary, financial and even physical, of sustaining so vast an enterprise, are so considerable that we cannot but congratulate the projectors on having reached a third year and an eighth volume. The fear might have been entertained that even a sphere so wide and diversified as the Fine Arts would in the long run fail to meet the unceasing demands of a literary corps required to occupy in every year four "magnificent volumes," making a total of more than twelve hundred large pages. But such are the scope and the possibilities of art in the historic past, the actual present, and the proximate future, that even a journal of this portentous magnitude need not fear, at least if we may judge by its latest issues and announcements, either paucity of topics or poverty of illustrations. It is to be borne in mind that there is a constantly recurring crop of new subjects; not only do old materials admit of being viewed in fresh lights, but with the increase of wealth, the persistent enterprise of geographic discovery, and the widening of the area of civilization, art creation becomes stimulated to the utmost. Regions of the earth hitherto barren are brought under art culture, and outward nature, as well as human nature, is ever presenting new and unaccustomed phases more or less capable of art treatment. Hence, perhaps, the times are ripe for a cosmopolitan and eclectic review which, in the words of the proprietors, shall seek "to establish an international community in matters of art, and to promote among the different nations of Europe and in America a knowledge of what is highest in the art product of the time." That there exists a public ready to appreciate and support this world-embracing enterprise is indicated by the announcement that "*L'Art* for 1875, consisting of three volumes of 416 pages each, is now almost entirely exhausted."

The letterpress, which is sometimes little more than an echo to the illustrations, falls short of the high standard to which the projectors of the journal aspire. Indeed it would appear that the number of specialists qualified to treat of art with technical knowledge and literary skill, at once satisfying to the professional man and pleasing to the outside public, are as rare in France as in England. And the difficulty is certainly not lessened by the presence of illustrations; for the critic has to compete by the instrument of words, often necessarily inadequate to the occasion, with pictures which make direct appeal to the senses, and in this conflict it often comes to pass that the pictorial art gets the better of the written art. We remember to have heard the late Charles Knight, whose experience had been extensive and costly, when moving a vote of thanks to a reader of Shakspeare, speak emphatically of the gain to the author of holding undisturbed possession of the entire field. He concluded with condemning the ascendancy of the scene-painter, and added a remark made by Macready to the effect that a moonlight on the stage threw completely into the shade the finest poetry. Yet Macready may be said to have answered his own objection when he got Clarkson Stanfield to paint scenery for *Comus* and *Acis and Galatea*. In the case now immediately under our notice the advantages and the disadvantages are about equally balanced. The letterpress, which may not be always strong enough to stand alone, receives support from the interspersed engravings. In fact, biographical papers like those on M. Fromentin and M. Diaz naturally suggest, if they do not even demand, that the life of the artist should be seen through his works; and it must be admitted that the illustrations selected enable the reader all the better to realize the visual situation and to place himself in the independent and impartial attitude of critic. It has been said that painting is a silent art, and poetry a vocal art; accordingly the legitimate aim of the literary part of these pages is to make the pictures speak out their intention. These French writers ply a sketchy, brilliant pen which has the advantage of meeting the painter's pencil on

common ground and in a sympathetic spirit. Thus M. Jean Roussseau, in his portraiture of M. Eugène Fromentin, throws pleasantly and picturesquely together the central subject and its scenic accessories. The reader is introduced to the artist and his contemporaries as follows:—

Il est intéressant et instructif à suivre comme toute vie logique bien ordonnée, qui, au lieu de s'éparpiller à tous les vents qui soufflent, se développe régulièrement dans un sens voulu, pour atteindre un but déterminé. A ce point de vue, la vie de Fromentin offre la même unité que celle de Millet, avec lequel il contraste d'ailleurs si complètement sous tout autre rapport. L'un voué à la contemplation des grandeurs obscures de la vie des champs, l'autre attiré et fasciné par les richesses pittoresques de l'Orient, comme l'avaient été avant lui Decamps et Marillat.

Chacun a exprimé l'Orient à sa manière. Marillat a rendu l'admirable limpidité de sa lumière; Decamps, les ardeurs incandescentes, le morne flamboiement de son ciel aux heures les plus lourdes de l'été, et les silhouettes grandioses de son paysage primitif. Fromentin semble avoir cherché—avec un peu trop de système peut-être—à nous révéler un côté assurément très-ignoré: sa grâce, son élégance, voire son esprit.

L'esprit de l'Orient! le choc seul de ces deux mots ne sonne-t-il pas comme un contre-sens?

M. About—seul de tous les critiques—semble avoir entrevu, dès les débuts du peintre, la fausse voie où il s'engageait: "Les tableaux de M. Fromentin," écrit-il dans son *Salon* de 1857, "sont très-spirituellement écrits. . . . La collection de ses œuvres pourrait s'intituler: 'Un feu d'artifice dans le désert.'"

Such an appeal to M. About is somewhat of a confession that the once illustrious school of French critics has lost its sober reason. We have before us sundry volumes by this omniscient censor and pseudo-cyclopaedist, a man who has never given himself seriously to any one subject, but who trusts to a sword-play of words and of wit, and pays his devotions by turns to the Madonna and Leda. Another "devil-may-care" critic was M. Théophile Gautier, a writer who turned the finest texture of art into fustian, and whose fevered imagination was as far from true balance as the vagaries of Mr. Ruskin. *L'Art*, which follows too much in the track of its contemporary, *L'Artiste*, would do well to aim at a weightier and more solid style of intellectual criticism. There is at present too much ado about nothing, and the all but illimitable space at command may serve as a temptation to distend thin, superficial thought over the utmost possible area. We recall by way of contrast the concentrated and searching criticism which came at a more soundly critical period than the present from the pens of M. Beulé, M. Planché, M. Taine, and others. We look in vain for like knowledge and acumen in the volume before us. Is it that, under the fetters and the corruption of the Second Empire, even art criticism has received a mortal wound from which it is slow to recover? Yet regeneration for the French nation seems within the possibilities of the future; and with that resuscitation it may not be vain to hope that creative art will once more enter on a renewed life, and that its attendant criticism may turn from frivolity to earnestness. In such an event *L'Art* should seize on its opportunity; it may then fulfil what it now desires; national life may speak through the life of regenerated art.

France naturally occupies by far the largest space in these pages; and her school, though now in decadence, remains the foremost in Europe. Her ranks have been within our memory decimated; we have seen swept from the field of action great leaders such as Ary Scheffer, Delaroche, Flandrin, Cogniet, Horace Vernet, Ingres, Delacroix, Decamps, Benouville, Jardin, Troyon, Fromentin, and Millet. Truly, in the words of a French critic, "*L'École française est décapitée*." Yet an artist in passing from life assumes his place in the roll of history, and thus furnishes materials for the columns of a journal which takes a retrospective view and guards posthumous fame jealously. Mlle. Rachel, when dying, exclaimed, "In a few hours I shall be in the hands of my undertaker and my biographer"; and the vulture does not watch with keener appetite the battle-field than the man of the press watches the registry of deaths. *L'Art* has already done good service in collecting biographical details of artists who deserve to live beyond their own day. In our own literature we have a model of how art biography may escape from narrow technicalities and enter on wide sympathies with humanity, in Mrs. Grote's *Life of Ary Scheffer*. In fact, French artists, from the time of David under the first Republic down to the Communist M. Courbet, have been something more than artists; fired by enthusiasm and passion, they have entered as actors into the drama of life; they have mounted barricades, and have then painted in hot blood the fierce onslaught of battle. Such careers favour the literary *tableau* style of which the eight volumes before us afford examples.

The sphere already occupied by *L'Art* will be, we are glad to learn, still further extended. The proprietors propose to give to their venture a more pronounced "international" character. Germany, for obvious reasons, has hitherto not been allowed to invade its pages in any formidable force. But the world is large enough, and many are the territories in Northern, Central, and Southern Europe which might furnish at least occasional contingents. The present war, especially along the line of the Danube, rich in Roman remains and rare in graphic memorials of strangely picturesque races, might be made to open up valuable treasures. The Museum of Pesth, abounding in works which illustrate the historic phases of art in lands lying on the confines of the East, has never been adequately brought before the knowledge of Western Europe. We may add that the ethnographic sketches and etchings made some years ago on the banks of the Danube by M. Valerio won a eulogy from M. Gautier, and obtained well-merited attention when published in the pages of

L'Artiste. Following the same track, *L'Art* might do wisely to send a special commissioner to the seat of war.

But evidently the operations which just now obtain most favour are turned towards England. Under the direction of Mr. Comyns Carr "the pages of *L'Art* will, during the present season, contain a full representation of the works exhibited at the Royal Academy and the Grosvenor Gallery." It is announced that the illustrations will include etchings and engravings from the pictures of Mr. Leighton, Mr. Watts, Mr. Burne Jones, Mr. Boughton, Mr. Archer, Miss Clara Montalba, and many others. The *entente cordiale* between England and France has been drawn all the closer by "The Librairie de l'Art" recently opened in London. Perhaps it may be objected that the illustrations, though occasionally of a high class, will, as a rule, scarcely satisfy the sensibilities of our English artists, unless an improvement be made on the photo-reproduction process hitherto employed. But so many difficulties have been already overcome that the past may be accepted as a pledge of further progress.

HELPS TO THE GREEK CLASSICS.*

SINCE his first edition of Theocritus in 1844 the Bishop of Lincoln has seen wonderful changes in the field of Theocritean criticism, where the more recent German labourers have made fruitful use of his own earlier studies of the text and its interpretation. He has therefore approached the task of revision and improvement with confidence, in spite, or perhaps in relief, of many preoccupations, quoting Gregory of Nazianzus, Basil of Cesarea, Ambrose, Jerome, and Augustin as precedents for episcopal study of the ancient pagan classics; and his new preface is an eloquent persuasive to the cultivation of classical studies as good training in the exactness of thought and graces of language desirable in a Christian divine. Admitting that blemishes and impurities here and there disfigure such poets as Theocritus, he pleads the moral advantages to be derived from them in other aspects, if only we associate such studies with those of the true religion, and allow the latter to tone and correct the former. Where no such corrective is applied to lax heathen morality, he would, we fancy, approve the application to classical studies of an expression in Idyl xxvii. 62 (soundly emended by himself), where a damsel who has found Diana's protection insufficient for her virtue addresses to her the complaint, *σὴ ἐρήμια οὐκέτι πιστή*. Secular studies, liberal arts, culture, philosophy, cannot without religion keep us healthy in morals. From the contemplation also of the poet's natural piety and sense of natural beauty the Bishop is led to reflect how much he might have achieved had our light been vouchsafed to him. The simple piety breathing in a Theocritean shepherd piping on a rock over the Sicilian sea, on the grassy banks of the Anapus, beside the pine-shadowed fountain, or under a leafy canopy at the Coan Thalyssia, is preferable, he justly deems, to the mental and spiritual condition of those "qui post splendorem divini aspectus in Verbo Veritatis revelatum, in obscura caligine errare contenti sunt, et in formidoloso et inhospitali barathro volutare rerum naturalium et causarum secundarum, a divino intellectu, amore, et potentia conditoris, Qui, ut cum Newtono nostro loquar, 'omnia regit, non ut anima mundi sed universorum Dominus,' longè latèque remotarum."

True to his conviction that the teacher and student of the classics should read them with a Christian bias and spirit, Bishop Wordsworth never omits to point out the contrasts in treatment between sacred and heathen poets. A patent example is the handling of the woes of Daphnis in Theoc. i. 106, and elsewhere, and those of Lycidas in Milton's *Direge*; and in the Bishop's note on the taunt of Daphnis to Venus the contrast is pointed out betwixt Sion and Parnassus as regards tenderness and refinement. Dr. Wordsworth has added to his original notes on the text and its interpretation succinct Latin explanations and illustrations, wherever they are needed. Thus at Id. vi. 16, *καὶ τὸν ἀπὸ γραμμῆς κινεῖ Νῆδον*, an explanation is given of the allusion to the proverb of trying one's last chance by moving one's man in a game of draughts from a certain line, which Fritz, a late German editor, has noted. At Id. vii. 78 there is a brief note on the story of Comatas, a poetic shepherd shut up in a chest and committed to the waves for two months because of his piety, but kept alive by the bees which lined his cell with honey-combs, and eventually drawn out safe and sound—which seems a perversion of the traditions of the Deluge of Noah. Again, *ibid.* v. 137, *νυμφῶν δὲ ἄντροιο*, our editor seasonably refers to a description of his own visit to the Cave of the Nymphs, in his *Athens and Attica*, vol. ii. c. 32; and, at v. 92 of the same Idyl, he caps the custom of "crying God bless you, when one sneezes"

upon the words *Συμχίδα μὲν Ἐρωτες ἐπένταρον*, with references to Catull. xlix. 9-18, and to usage in modern Italy.

It will be seen, then, that the second edition of Dr. Wordsworth's Theocritus is an advance on its predecessor. A few samples of the soundness and acuteness of the Bishop's criticism on its textual difficulties will recommend it still more to notice and use. They are picked chiefly from the earlier Idyls. At i. 50-1, in the picture of the foxes and the vine-watcher, where the fox, which is not stalking the rows, is plotting mischief to the lad's wallet, the verses—

τὸ παιδίον οὐ πρὶν ἀνήσειν
φατί, πρὶν ἢ ἀκράτιστον ἐπὶ ξηροῖσι καθίη—

have caused much puzzle to commentators. Bishop Wordsworth has since his first edition satisfied himself of the sense; *ἀκρατισμός* (from *ἀκρατος*, meracus) is the rustic's morning meal—namely, a fragment of bread steeped in neat wine, which without its moistening element is indeed poor and dry fare. Hence the proverb, *ἐπὶ ξηροῖσι καθίησιν ἀκράτιστον*, "to reduce one whose meal is a winesop to a dry crust." The scholiast's language consists with this interpretation, which our editor applies to the fox's set purpose of robbing the boy's wallet of his breakfast and leaving him dry and breakfastless. In Idyl ii. 151:—

αἰὲν ἔρωτος
ἀκράτω ἐπεχείρο,

he defends the reading, and translates "Sibi infundebat de liquore meraco Amoris sui (i.e. amasii) in honorem." To revert for a moment to the First Idyl we are much struck with the probability of the Bishop's reading *ἐ* (*illum rivalem tuum*) for *τε* in the verses 81-2:—

ἀ δέ τε (ἐ) κύρω
πᾶσας ἀνὰ κρίαντας παντ' ἄλσισι ποσσὶ φορεῖται.

As is acutely urged, such must have been the reading of Virgil's copy for him to write in the Tenth Eclogue:—

Tua cura Lycoris
Perque nives alium, perque horrida castra secuta est.

In v. 96 *ibid.* Venus is described somewhat contradictorily as

λάβρια μὲν γελᾶσα, βαρὺν δ' ἀνὰ θυμὸν ἔχουσα,

where for *λάβρια* the Bishop suggests reading *ἀδρήν* h.e. *ἀδραίη*. The sense would thus be "Smiling to outward view, but nursing wrath within." In the Seventh Idyl, at the 8th verse, he *προφαίη*, with Hesiodus, and the seeming countenance of Virgil, *Ecl.* ix. 41, *ὕφανον τοῦ ἔφανον*, and in Idyl viii. 91, by a slight and admissible addition, he relieves the received text of an inconsistency that any attentive student must have felt. It is said there of Menalcas, the crestfallen and defeated challenger:—

ὥς δὲ κατεσμήχθη καὶ ἀνετρέπετο φρενα λύπη
ἄτερος· οὕτω καὶ νύμφη γαμβεῖα ἀκάχοιτο.

But, as the Bishop, with due penetration of the female mind, remarks, why should Menalcas's chagrin in defeat be likened to a bride's when she has won a husband? By the little insertion of *οὐ* before *γαμβεῖα*, and making the corrected text speak of a "sponsa non compos facta conjugii"—"a damsel betrothed, but jilted and forsaken"—he renders the comparison plain and pertinent enough. The last syllable in *νύμφα* is short in Theoc. xxvii. 51 (*fl.* iii. 130, *Odyss.* iv. 743), so that there can be no difficulty on that score. But it is needless to dwell further on this elegant and greatly improved edition of Theocritus, of which our national scholarship, and even our National Church, may well be proud.

Mr. Paley's *Acharnians*, as might be expected, goes far to fulfil its aim—to wit, the happy medium betwixt brevity and prolixity—and neither teacher nor pupil can justly complain of the waste of words on the one hand, or the omission of needful explanation on the other. If there is a fault in his volume it is in his making too much of the itch for alteration and rash emendation of the text of Aristophanes which he complains of (not without some justification) in the German editors, of whom he regards English editors as the too obsequious followers. As he observes, Albert Muller's edition, valuable as it is, sins grievously in this respect, though our own Elmsley and Dobree were by no means without error. Meineke and Cobet, sound and often acute scholars, require to be followed in their Aristophanic studies with caution and reservation; and Mr. Paley's climax of wild guessing, Hamaker, is the best proof of his argument that modern German Aristophanic criticism tends rather to show the critic's ingenuity than to improve the author's text. To a large extent we concur with Mr. Paley in this matter, but he goes too far when, in his address "to the Reader," he includes in his charge against the German critics Dr. Hubert Holden, a sound and sober scholar as well versed in Aristophanes as Mr. Paley himself. We must here quote Dr. Holden's preface to the third edition of his Aristophanes, where, so far from showing himself a worshipper of Meineke, he writes, *apropos* of Cobet's merits:—"Germania minus bene res cepit, nam qui agmen ducit Meinekius, senex venerabilis ac de Græciæ litteris optime meritis, ut pauca feliciter novavit, ita multa mediocritas et ab omni veritatis specie abhorrentia protulit aut aliunde arrepta adscivit, quorum quidem nonnulla ipse in Vindicis meliora edoctus retraxit: idem sana temere in suspicionem vocavit." We may add that whilst in one or two instances Dr. Holden in his first edition would himself confess to having followed Meineke's innovations, in subsequent editions he has reverted to the MS. reading. After all, it is admitted by Mr. Paley that he himself follows

mainly the text of Borgk, who is to some extent an innovator, while Dr. Holden generally (though in our view never without due testing of conflicting judgments) takes Meineke for his guide.

One key to the interpretation of Aristophanes which Mr. Paley has used to good purpose is the incidence in unsuspected places of the *παρὰ προσδοκίαν* figure, which he, we fancy, was the first to see in *Ach.* 17, ὑπὸ κορίας τὰς ἀφῆς, where might have been expected ὑπὸ γ' ἀνίας τὰς φρένας. Something akin to this is his perception in 13-14 of the joke ἐπὶ Μόρχῳ ἀρόμενος Βουδῆτιον, a double entendre for to "sing cow after calf"; and there is a similar play on words in the words οὐδ' ἦδ' ἐπὶ πρίῳ, ἀλλ' αὐτὸς ἐφῆρε πάντα χῶ πρίῳ ἀπὴν, which Mitchell renders by "that grating Byword, Buy"; and Mr. Paley turns "It never *saw* want, but produced everything itself, and that *saw* was far away." An apter pun perhaps occurs, as Mr. Paley shows, at v. 183, where Amphitruos represents the Acharnian old men twittingly asking him σπονδὴς φέρεῖς, τῶν ἀμπελῶν τετρημέναν; "How can you bring wine when the vines have been cut down?" In the line 111, where Dicaeopolis undertakes to cross-examine Pseudartabas, and says ἀγε δὴ σὺ φηδάνῳ ἐμοὶ σιφῶς πρὸς ταυτοῖ, κ. τ. λ., we cannot agree with Mr. Paley that it is better to take ταυτοῖ for the ambassador who had introduced him than in the comic sense of adjuring him by the strap, understanding ἱμάτια (i.e. "per hanc scuticam") as Meineke, Muller, Ribbeck, and Dr. Holden take it; and a little further on, in v. 140, we cannot assent to his following the older authorities in continuing the words ὑπ' αὐτῶν τὸν χρόνον δὲ ἐλθόντι Θέοφωτος ἡγουμένῳ as part of the envoy Theon's speech, instead of, with Nauck, Meineke, Muller, and Holden, making them an interruption of Dicaeopolis. It is more in character for the home-abiding cit to suggest a synchronism of the frozen rivers in Thracia with a rigid home tragedian's acting, than for an envoy, who would have had to get up his theatrical news much after date on his return. We will only add that throughout the play, the more we compare Dr. Holden's text with that of Mr. Paley, the less need we see for adopting the over-caution of the latter, or for classing the former with the rash and innovating class of editors. The world of scholarship looks forward with great interest to Dr. Holden's promised Aristophanic Lexicon. Mr. Paley can afford to edit such useful "texts and notes" as that before us with less constant criticism of rival editors.

We must briefly notice two other annotated texts recently issued, Mr. Pretor's Fifth Book of Xenophon's *Anabasis*, and Messrs. Phillpotts and Jerram's Selections from Xenophon's *Iubasis*. Mr. Pretor's *Persius* and *Cicero ad Atticum*, B. I., have both received a word of approval from us in past years, and this handling of an interesting book of Xenophon gives evidence of the thorough mastery of subject which we should have expected in Mr. Pretor. Though his text is not assisted by maps, and though here and there (perhaps through printer's errors) it represents untenable readings, we are bound to say that his little volume is more complete as a school-classic than the same book of Xenophon in the serviceable edition of his predecessor MacMichael. More special pains have been given to the elucidation of constructions, for which Xenophon offers a fine field; witness in the very first chapter § 8, τὴν δύναμιν, ἐφ' ᾧς αὐτὸν ἴσταν, where, for the numbering construction of finding an antecedent of ἐφ' ᾧς in ταύτων, Mr. Pretor rightly discovers it in the fact of δύναμιν being a noun of multitude; and in the second chapter, § 2, the somewhat kindred construction of ὁπότεν μὲν τὰ ἐπιτήδεια βάδιον ἦν λάβειν, οὐκ ἔγον, φῖλαι γὰρ αὐτοῖς ἦσαν, where, as he correctly states, αὐτοῖς is introduced as the grammars put it, κατὰ σύνεσιν, ὁπότεν in the preceding clause being virtually equivalent to ἐς ταύτους ἐφ' ᾧς. Compare Herodotus, ix. 1. To go no further than this second chapter (which, by the way, contains a vivid account of the Greeks' assault on a hill fortress of the Drila, against which the Trapezuntian guides had led them), we find such constructions as the conditional genitive absolute clause, ὡς ἀλλότῳς ἀν τοῦ χωρίου, paralleled and illustrated, and the nominative absolute, καταλίνοντες οἱ λοχαγοὶ οἱς ἐπίστευεν, standing as often it does at the end of a paragraph. So, too, we observe with pleasure that in such a stirring bit of history as this assault, of which even an idle boy, if of any spirit, would have some curiosity to know the issue, Mr. Pretor withholds the lexicon renderings of διηγεσάμενος (§ 12), μνησθεῖς (§ 13), χαράκαμα (§ 27), with a view to a wholesome searching of Liddell and Scott; whereas for the senses of ἐφ' ᾧς "in single file," θάρσει τὰ ὅπλα (§ 8) "to stand to arms" (see Grote on Thuc. ii. 2 for its various senses), ἐπὶ πῶδα ἀνέχωρον (§ 32), they retreated backwards—i.e. "with face to foe," "step by step" being only a secondary and derived sense—he affords the just modicum of elucidation and illustration. Through the rest of the chapters of this Fifth Book, which, it will be remembered, includes the discontent of the troops at Sinope, and the trial of the generals Philistus, Xanthicles, and Sophacetus, and therefore a good deal of lively narrative, Mr. Pretor will be found a most competent guide.

The Selections of Messrs. Phillpotts and Jerram profess to simplify Xenophon's style, not in order to save boys the labour of thought, but to educate their thinking power in translating authors whose style is as yet beyond them; and for such doubtless it is a great advantage that the selections should be graduated, the tenses, sentences, and even words being accommodated to a careful progress amidst difficulties. The volume has an excellent vocabulary, a series of sections stretching over the whole of the *Anabasis*, a handy, clearly drawn map; and brief simple notes. In the course of the selections and in chapter vi. we come at p. 60 on

the account of the taking of the same fortress which we have visited in Mr. Pretor's edition. It is curious to note the adaptations of the text whereby the editors aim at helping their pupils. Where the original runs μαχομένων δὲ αὐτῶν καὶ ἀπορουμένων, θεῶν τῆς αὐτοῖς μηχανῇ σωτηρίας δίδωσιν, for the first five words Messrs. Phillpotts and Jerram read ἐν ᾧ δὲ ἐμάχοντο καὶ ἡπορούοντο, and then proceed to rearrange in construing order the rest of the words; as if ἐν ᾧ δὲ, which requires a note, were not a harder construction than an ordinary genitive absolute. We do not deny that there follow one or two involved constructions in the original, which upon their principle have been naturally simplified by excision. Perhaps this is in some cases necessary; yet it does not strike us as a very sure way of inspiring beginners of Greek with a spirit of accuracy; nor do we believe that, with pains taken *enōi voce* by masters to clear away syntactical difficulties from the path of their pupils, it would be a much greater hardship to make them disentangle a sentence of Xenophon in the very words and order of the original. Certainly the result would be of more lasting value, though we readily admit the ingenuity of the arrangement, and the grammatical notes and kindred matter, of these Selections.

MARKS ON CHINA.*

THE combination of bitter and sweet which goes to make up the life of man receives excellent illustration from such a book as this before us. It has been said that our pleasant vices become scourges; but collecting is seldom a vice. There is a sting even in it, however. It is the same with many other innocent pursuits. There is an element of dry dulness in the most absorbingly interesting study. How many people would be chemists were it not for the formulas which must be mastered? How many would be astronomers if they could overcome the preliminary mathematics? They may read popular treatises, and talk eloquently about soaring through limitless ether and the radiance of ten thousand suns, but they cannot fix the place of *Alpha Geta* or *Signa Scorpionis*. We all build castles in the air, yet how few of us could draw out specifications for a cottage! We all criticize pictures, but how many can sketch a figure correctly? It is the same with the subject immediately before us. To collect china successfully it is absolutely necessary to know the marks. It is true that the man of real taste, who knows what he likes and why he likes it, is often independent of such considerations. He does not care for an ugly piece, whether it is marked or not. He depends on his own judgment, and refuses to be bound by anything lower than the abstract rules of beauty. Now and then such a collecting genius is successful. His instinctive knowledge places him at a great advantage above the plodders. But in order to have a certainty of success it is needful even for the genius to plod. If he would make sure of acquiring a fine collection, he must learn something about marks, and his talents may not avail him here. It is the willingness to undertake this kind of drudgery which gives the ordinary tasteless dealer so powerful a position. He obtains knowledge at the price of hard work, and he retails his knowledge with a heavy addition for profit. The collector has not always his knowledge about him. He has often to buy at a venture, and is constantly deceived. It is in his interest that such little books as the present are published; and that a large number of persons require, and actually use, such pocket-companions, we may gather from the fact that three or four similar books in English or French have already been published, as well as the larger works on which all the manuals are founded.

Almost all pieces of pottery and porcelain, even those of the humblest kind, bear on them some distinctive mark. The cottage tea-cup of thirty years ago is the collector's object now. The crown Derby which was sent to the garrets as too hideous for use while Gothic taste ruled among us is now taken up tenderly, its fractures repaired, and is placed in the forefront of the cabinet. "Delft" used to be synonymous with rubbish, so far at least as it was applied to pottery. Now the soft paste and glazed earthenware of the Low Countries are collected and catalogued, their marks are registered, their patterns are extolled, and their dingy colour has become cerulean. Of course prices have varied in like manner. Old English figures, grotesque and unnatural, as remote from art as from beauty, which used to be sold at country fairs for a few pence, now fetch as many pounds. And the only thing which seems to make this difference is the presence or absence of a mark. To be able to recognize and identify a mark easily and rapidly is a power worth countless sums. Very few people have the kind of memory necessary, and such a manual as this of Mr. Hooper and Mr. Phillips, which can be carried almost in the waistcoat-pocket, may be of inestimable value to the collector. Its scope is very clearly set forth in the preface. The work, which runs to 236 pages, is divided into four parts. In the first the marks are classified under heads. In the second the Italian maiolica factories are arranged alphabetically by their names. Of the ware itself the authors truly remark that it "is coarse and bad, but it is valued for the decorations, which are from designs by Raffaello, Michael Angelo, Giulio Romano, and other great masters, and some are thought to be painted with their own hands." Twenty-five manufactories are named in alphabetical order, some easily-identified lettering or other sign

* *Manual of Pottery and Porcelain Marks.* By W. H. Hooper and W. C. Phillips. London: Macmillan. 1877.

being given in the margin. This part is too much condensed. Mr. Fortnum has noticed some sixty different towns in Italy as possessing maiolica manufactories, and a very large addition to Messrs. Hooper and Phillips's list of marks would be required to make it of much value to the collector. Maiolica, and indeed also Delft and all ornamental earthenware as distinguished from porcelain, have what may almost be called a sentimental interest for the art student. They seem to embody the triumph of mind over matter. The wonderful power which transforms a rough brown vessel of coarse baked clay into a work of the highest art—such art as even the prince of painters need not disdain—must always possess a peculiar value. Though of late years the country districts of Tuscany and Umbria have been searched for specimens, they are by no means exhausted; and the modern seeker must hire a special conveyance if he wishes to take the fat South Kensington volume with him on a tour. In the third part the other European factories are similarly arranged, so that there are cross references, first of marks to places and secondly of places to marks. This is extremely convenient for rapid consultation, and enables the collector either to verify his own opinion or to find the mark before him in a very few minutes.

The fourth part of the book contains what are called "Oriental," that is, Chinese and Japanese marks, according to the number of letters in the mark. This is the most recondite portion of the book. It is only within a few years—we had almost said months—that the study of the Japanese and Chinese languages has sufficiently advanced among us to make it possible to obtain correct readings of the inscriptions which almost every piece of porcelain bears. Chinese porcelain is said to date from a period as remote as 100 B.C., while the pottery may be much more ancient. The oldest now to be obtained is that made under the Ming dynasty, which began to reign about the same time as our House of Lancaster. The famous tower of Nankin, only destroyed a few years ago, was erected in the time of Yung-lo, who occupied the Celestial throne from 1403 to 1424. In Mr. Chiffers's great book he gives the names and marks of all the dynasties from that of Tung-han, A.D. 25, to the present time. But Messrs. Hooper and Phillips observe that marks are so easily imitated, and Chinese potters are so fond of reproducing old patterns, complete with marks and all, that little reliance can be placed on the earlier dates. The old blue Nankin is from the Imperial factories, and bears the well-known "six mark," which is believed always to indicate a year before 1667, when an edict of the governor of the province forbade the use of the Emperor's name, lest, if any piece was broken, it might be profaned by being carelessly thrown on the dust heap. Our authors give full particulars of this famous mark, and add tables from which the date may be deduced. Japanese porcelain is said to date from 27 B.C., and to have been greatly improved after the thirteenth century, when a potter visited the Chinese Imperial factory at Kin-to-Chin under the disguise of a priest. The pottery is of course much older than the porcelain, pieces still in existence being said to date more than 1000 B.C. The great centre of Japanese manufacture is in the province of Ise, where twenty-five villages are congregated on a mountain which affords a plentiful supply of material for their work. The marks are usually the name of the factory or of the maker or the decorator, and sometimes of all three. In addition to these there are a number of signs which may be looked upon as analogous to the "present for a good child," and similar sentences which we see on common English ware. They consist of blessings, charms, salutations, and good wishes, sometimes written in full, sometimes signified by a symbol; and occasionally, it is apparent, these signs are referred to certain manufactories. Thus the Government works in Japan mark with the words "II'atsi fou kie sha," which means "Assembly of the seven honourable societies," and other pieces bear an emblem of longevity or a prayer of happiness. In China a great variety of these inscriptions are to be found—"long life," in Chinese "show," occurring oftener than any other character. In ordinary writing it is a sign like a double latch-key; but the natives of the Flowery Land have devised so many ways of writing it that a single plate is sometimes marked with a hundred or more. Such specimens are called pieces of "the hundred show." A whole page is filled with examples. This part of the book appears to be very thoroughly done, the information being for the most part nearly new to English readers. Small as the book is, in fact, it contains an immense amount of information, and has but one important fault, a fault inseparable perhaps from its design, that the print and many of the marks are so minute that the book would seem to be chiefly intended for young beginners in the noble pursuit of China-collecting.

MINOR NOVELS.

EDGAR and I is a very foolish story, told in the form of an autobiography of a so-called Ritualist priest and his wife. The hero is a poor prig and his wife a silly, weak creature. The book is as dull as a Low Church tract; duller even than a collection of

Methodist sermons. We could hardly have believed that so much dullness and so much folly could be got into one volume. It is the kind of book that might be written by some young woman who was not aware that there was any other literature outside the sermons that she heard preached by a young curate fresh from Oxford. The quotations, indeed, at the heads of the chapters from Mrs. Browning, Keble, Miss Rossetti, and one or two others, show that the author can boast of some reading; but in the book itself there is nothing that shows even that second-hand insight into character which is got from story-books. We can scarcely believe that she has read even Miss Yonge, unless perchance in the *Monthly Packet*.

But to come to the story. The heroine, Agnes Granton, says that "once my sisters brought to me an album containing various questions to be answered. Of these the most noteworthy was 'What is your greatest desire?' I answered instantly, though refusing to write my answer in the book, 'Some one to obey.'" Now if she had answered "Some one to love, honour, and obey," we do not know that she would have said anything in which nine-tenths of the young ladies, of whatever sect or creed, would not cordially agree, even if they did not openly speak out their minds. But she was sincere. She wanted to have a real master, and she soon got one. The Rev. Edgar Seymour before long "told me he loved me, but in words which to many would have seemed cold." Her friend Dolly Clifford was at the same time engaged to the Rev. Peter Dale. Dolly received a letter daily from her lover, but the Rev. Edgar in three weeks only wrote twice. His two letters "began 'My dear Agnes,' and were signed 'Yours faithfully.'" When "Yours faithfully" returned to visit her whom we may very properly call "Yours obediently," he greeted everybody in the room first, "and then, while I was foolishly shrinking and blushing, took my hand with the grasp of possession, which I liked, saying in a perfectly audible tone the commonplace words, 'Well, Agnes, I am glad to see you.'" Even "yours obediently" felt this to be a little too cold, and ventured to remonstrate. "'Surely, Edgar,' I said to him, 'it is my duty to love you now.'" "Yes," replied yours faithfully, "but you can love me, we can love each other, without self-indulgence as to mere feeling. I am afraid for us both." Matters were going on pretty smoothly, if somewhat freezingly, when an old uncle brought the heroine "a handsome, though most unsuitable wedding gift—namely, a diamond pendant and earrings." This led to a discussion, which passed into very sinful talk on Agnes's part, which was followed by a confession to Edgar, not as her lover, but her priest. He said to her, "Agnes, you have sinned greatly," but most considerably added, "I cannot feel blameless in this matter." He proposed at once to go off to Newcastle to help in a mission there. "'Oh Edgar,' cried I, 'to lose our happy Sunday together.'" "Yes," said he, "we want something really painful, and I think we should both feel that." The engagement goes on in much the same way. At one time he says to her, "I have been thinking, Agnes, what a privilege it is to have a fault as severely visited as yours has been." At another time he asks her, "Is it not well you have learned a lesson of humility even by a fall?" At last they get married, and actually take a wedding tour; for "my husband thought it would not be self-indulgence to spend a few weeks alone together." On their return to the Rectory in the East end of London all indulgence came to an end. The Rev. Edgar would not let his wife take his tea to him in his study, to the astonishment of her friend Dolly, who had married the Rev. Peter, and was on a visit to them with her husband. "Their ways," says the heroine, "were a contrast to the calmness Edgar thought it necessary to enforce on himself and me." A few days after he declined the tea, he came home "extremely weary. I should have liked to make him rest on the sofa, but I knew I need not propose such a thing." A young lady who was in the room asked him, "Do you think it wrong to sit in an easy-chair?" "Not for you, my dear Mary," he replied. Greatly as the poor wife improved under all this salutary training, yet she had her backslidings now and then. She almost worked herself to death in the parish, and, as a consequence, "during the Church services my mind wandered over plans and projects, good in themselves, but certainly oxen, sheep, and doves brought into the Temple." In reply to her husband's reproaches she said, "It is not my fault; I am so busy." For making false excuses she was at once visited with a penance. "I think, Agnes, you had better not communicate on Sunday." She yielded at once; but further talk showed that she was even more sinful than she had at first sight seemed, and the Rev. Edgar added, "Agnes, I wish you to refrain from Holy Communion for two Sundays." "Yes, Edgar," I said, "really submissively." But when he did sin, which was very rarely, he knew how to inflict penance on himself. One day, when she was breaking down from overwork and found her head too confused to write, she "half-mechanically took up a story which lay near." Her husband, coming in, exclaimed, "Agnes, is it necessary to give way to wilful self-indulgence?" Finding, however, that she was ill, and that he had been harsh, he shut himself up till next Sunday, "when he only appeared at church as one of the congregation, leaving all the duty to Mr. Wayland, and not communicating, though present at the mid-day celebration." Of course just at the end of the book he catches a dangerous fever while visiting the poor; but, contrary to all experience, recovers. He is, we believe, the first clergyman who in a story of this kind ever survived such an attack. Sanitary science has at last done something, if it has succeeded in reducing the fearful mortality of young priests.

* *Edgar and I: the Story of a Home.* A Novel. By Jessie P. Moncrieff. London: Remington & Co. 1877.

The Moonraker: a Story of Australian Life. By Richard Dumbledore. London: Remington & Co. Marlborough: E. and R. A. Lucy. 1877.

Was He Really Mad? and other Sketches: being Incidents in the Life of a Curate. By the Rev. Maberly Walker, late Curate of Park Green. London: Remington & Co. 1877.

It is a pity that so senseless a title as *The Moonraker* should have been given to Mr. Dumbledore's "Story of Australian Life." The book itself—at least as soon as the hero leaves England—is interesting enough; but the title, in spite of the explanatory anecdote, is affected and ridiculous. The hero is a poor country lad who shows a great love for animals, and is taken up by the vicar of his parish. It is, to a certain extent, the story of the good apprentice and the idle apprentice over again; for, while Edward Ford does everything that is right, and always prospers, so his playmate, Jem Johnson, does everything that is naughty, and at last meets a violent death. The author ought to have carried his reader much more rapidly over the introductory part of his story. There is in these earlier pages an affectation about it of minute description which is very wearisome. Who cares to read such passages as the following?—

"Well, poor dears," said Mrs. Moreton, "I will give them an extra breakfast, at all events, this morning, and as they have not taken the pledge, they shall have a little warm beer poured over their bread; but here they come under the verandah. Look at the old hen; she is stretching out her long neck, and pecking at the glass to try and look in at the table; but poor Hydarnes does not seem to be very happy; what a pity to find those lovely feathers in the snow. There, that is all they can have now," and Mrs. Moreton shut the window and turned to other matters.

As soon, however, as the two boys set sail from Blackwall, the narrative becomes really lively, and we can readily believe the author when he tells us that "it is a tale of real life." The boys are met at Melbourne by a settler, who takes them up to his sheep-farm in the bush. There they go through a sufficient number of adventures with snakes, kangaroos, and natives, while the daily life of an Australian shepherd is very well set forth. The hero goes on prospering till, on the death of his father he is summoned home, where he finds the church bells ringing in honour of his return. He soon gets a good situation as manager of an estate in England. The idle apprentice, who was constantly cruel to animals, gets at last killed in the bush by a horse which he had savagely ridden. He does not even have the honour of a funeral bell, for he was buried far away from any church. The story will be, we have no doubt, greatly liked by boys, but we must warn the young ladies that from beginning to end there is not a word of love-making. It is the first case in which we ever heard of a good apprentice not marrying his master's daughter, but remaining a bachelor. The author might object that, as the master had no daughter, the marriage was clearly impossible. But we should only have to shift our ground a little, and say that it is the first case we ever heard of a good apprentice having a master who had not a daughter, and an unmarried daughter too.

The Rev. Maberly Walker—whose name, by the way, we do not find in the *Clergy List*—gives us in one volume five stories founded, if we can trust the Introduction, on incidents that happened to him when he was a young curate. We cannot say that, in our opinion, the stories are either interesting or probable. The first, "Was He Really Mad?" which gives the name to the book, is very long and very dull. We should doubt whether many readers would care enough for either the lunacy or the sanity of the hero ever to arrive at the end of the story. As, however, he first tries to cut his throat, next "with a yell of delight" leaps into a reservoir, and in the end dies in an asylum, it is difficult to know why the author so prominently raises the question of his madness. The title would have been just as correct if it had been *Was She really Mad?* For his wife, by way of sympathy, goes mad also, and is brought to the same asylum the day before her husband's death. In the fourth story the author gives an account of a post-office robbery and of the trial of the son of a village post-mistress who was wrongly suspected. It is strange that writers cannot, by reading in the newspapers the reports of trials, avoid at least the most glaring errors when they take their heroes into the dock. In the trial before us the counsel for the prosecution makes two speeches before the counsel for the defence makes one; and though witnesses are called for the defence, the counsel for the prosecution has no reply. Nay, moreover, so far as it appears, the judge does not sum up. But the course pursued by the prisoner's counsel is still more extraordinary. The night before the trial the real thief had been caught by a policeman, who was hidden away in the post-office, in the very act of opening letters and stealing their contents. He had been previously summoned as a witness for the prosecution. In spite of his detection, the trial goes on as if nothing had happened, and the fact of his arrest is never mentioned. When he comes forward to give evidence, suspicion, no doubt, is thrown upon him in his cross-examination, but nothing more than suspicion. The trial goes to its full length, bating the summing-up; and, as we have said, witnesses are called for the defence, when a few words would have brought the whole affair to an abrupt conclusion. But then Mr. Maberly Walker's story would also have been brought to an abrupt conclusion, and so would have lost half its interest.

AMERICAN LITERATURE.

BY far the most attractive memorial of the Philadelphia Centenary Exhibition that we have yet seen is a work of which the first two numbers are now before us.* Each contains two plates produced by Messrs. Clay, Cosack, and Co., of Buffalo, with ex-

* *Treasures of Art, Industry, and Manufacture, represented at the International Exhibition of 1876.* Parts I. and II. Edited by C. B. Norton. Philadelphia: Snodder & Co. 1877.

planatory text in French and English, representing the finest works of art and of artistic industry exhibited at Philadelphia. There is, for example, an engraving of a group of statuary representing Cupid blinding the eyes of a victim, which, however, seems to us defective in that the face of the sufferer expresses rather the painful sensations of one who is being consciously deprived of sight than the passion which accepts this metaphorical blindness unconsciously and with satisfaction. Again, there is a splendid example of ecclesiastical decoration in the shape of a pulpit of carved oak, modern in style and conception as well as in execution, but quite worthy of the finest modern church or cathedral, with whose general tone and character it might harmonize. It appears to be the intention of the publishers to represent not merely the proper art treasures of the Exhibition, but also those applications of art to manufactures, furniture, and decorative purposes which are so striking a characteristic of the taste of the present age. The cost of the work, each number of which, containing only two plates, is priced at two dollars, must place it beyond the reach of the general public; and of those who can afford such expensive memorials of its existence only a few are sufficiently interested in the Philadelphia Exhibition and its relations to American history to care to preserve such a record of its choicest features. But, even in a purely artistic point of view, the work, both in its conception and execution, promises to be fully worth its price, and worthy of acceptance by that limited public to whose educated appreciation it appeals.

Another splendid work of a somewhat similar character, but issued from the Department of the Interior, is a description of the wonderful Grotto Geyser* of that Yellowstone Valley containing so many marvellous freaks of nature, which the liberality and taste of the Federal Government has appropriated as a national Park, and which some half-century hence, when the surrounding country has been peopled, will no doubt be the most interesting and precious of national estates. The Americans have shown great judgment and public spirit in thus appropriating and consecrating to the public use the finest specimens of scenery and natural wonders within their dominion. The splendid Yosemite Valley of California, with its giant trees, was many years ago thus acquired for the nation; but it had at that time already become an object of general curiosity, and was accessible to thousands of visitors. The Yellowstone Valley, whose marvels are far greater, if its beauty is not so striking, lies altogether outside the present frontiers of settlement and civilization, and is so far from the nearest railways, and surrounded by a country so wild, and as yet so utterly untraversed by roads, that only a few ardent naturalists or travellers have been able to explore it. Its reservation as a public possession is therefore an act of far-sighted liberality of which, so far as we know, no other Government than that of the United States has yet given an example. The illustration representing the most remarkable of the many natural fountains of this wonderful valley, and the text by which it is explained, are executed in a manner worthy of the subject.

A complete life of Mr. Seward would rank with the most interesting historical biographies which the next generation may confidently expect. Though the late Secretary of State was not in himself a very interesting personage, and though there was little or nothing in his character to command the admiration of contemporaries or the respect of posterity, he played a very considerable part in one of the greatest events of modern history. No one would dream of comparing his part on the historical stage with that of men like Cavour, Bismarck, or the third Napoleon; but among the second-rate figures of the age his was not the least prominent; and the great revolution in which he took a share may perhaps prove ultimately to have affected the future of mankind not less than the emancipation of Italy or the unification of Germany. But the work before us† deals only with the earlier and less important portion of Mr. Seward's career. It is divided into two parts—an autobiography, and a memoir filled up with a multitude of letters, more or less interesting as bearing upon the political history of the time, from the pen of one of the most active and intriguing politicians of America. From a comparatively early age Mr. Seward exercised a very great influence on the policy of the party to which he attached himself, rather perhaps from a mixture of prejudice and of clear-sighted self-interest than from strong conviction. A man of his cool judgment and political ability, devoid of enthusiasm and little likely to be led away by a popular craze, can hardly have been very sincere in his adhesion to that frantic agitation against Freemasonry with which he early connected himself, and out of which grew that Whig coalition of which the Republican party, so long dominant, first through military and then through political successes, is the offspring and heir. The principal value of the ponderous volume before us, which has been swelled by unimportant letters and elaborate details of insignificant transactions to the monstrous proportions characteristic of American biographies, consists in the records of those obscure political intrigues and personal ambitions in which a party that has played so great a

* *The Grotto Geyser of the Yellowstone National Park.* With a Descriptive Note and Map, and an Illustration by the Albert-type Process. Department of the Interior, U.S. Geological and Geographical Survey of the Territories. London: Trübner & Co. 1877.

† *Autobiography of William H. Seward, from 1801 to 1834. With a Memoir of his Life, and Selections from his Letters from 1831 to 1846.* By Frederic W. Seward. New York: Appleton & Co. London: Sampson Low & Co. 1877.

part on the historical stage originated. The anti-masonic agitation not a little resembled in its original unmeaning nature, and in the absurd suspicions that gave rise to it, the "Popish plot" which exercised so terrible an influence at a critical period of English history. Happily it resulted in no such general madness, and in no such horrible sacrifice of innocent blood. But, breaking out at a time when the old Federal party had been annihilated, and when the Democrats had so completely triumphed that it was no longer worth the while of ambitious aspirants to attach themselves to their cause, it gathered round it all the elements out of which a dangerous political faction could be created. The malcontents of the victorious and now unopposed party; all the men for whom there was not room in its ranks; all those who, ambitious of political distinction, found the avenues closed by a multitude of competitors with well-established claims to share in the patronage of General Jackson and his party, gathered round the first flag that promised them a rallying point, a subject of popular declamation, and a chance of distinction. Among these Mr. Seward was one of the cleverest, one of the most ambitious, and certainly not one of the most scrupulous. A student of politics who can read between the lines of autobiographical apologies and political letters may learn from these memoirs the true history of the rise of what was long called "Black-Republicanism" in America. The silly suspicions of and antipathy to Freemasonry in which the new party originated could not long endure, especially as the very nature of the society which had provoked them prevented its engaging as a body in political conflict. The party was therefore left with all its personal ambitions and animosities, but with no fixed principles or defined purpose. It was by the law of its being an Opposition, but an Opposition without common views or a public policy. General Jackson's violent temper, personal crotchets, and imperious administration soon furnished this Opposition with doctrines and with leaders. He made many personal enemies, who naturally fell into its ranks. It was perhaps an accident, due chiefly to the fact that anti-masonry had its whole strength in some of the Northern States, that prevented Calhoun, the bitterest of Jackson's personal foes, and the one political leader who had a distinct policy with which to confront that of the President, from joining the new faction, and associating it with the defence of slavery and the avowal of Secessionist principles. Falling under the guidance of exactly opposite ideas and of men almost as jealous of Calhoun as he was of Jackson, it gradually absorbed the more moderate opponents of slavery and imbibed their ideas. The volume before us brings down Mr. Seward's personal story and that of his party only to the period at which the Whigs were still influential and hopeful; but it illustrates precisely that portion of the party history of Republicanism with which Englishmen and the younger generation of Americans are least acquainted, and therefore deserves the careful study of those who would understand the secret history of the transactions by which Abolitionism, half a century ago the theory only of a few impractical fanatics, became first the war cry of a great sectional party, and at last the policy of the Union.

Mr. Amory's *Transfer of Erin** is an equally heavy, but by no means equally interesting, work. Its tone and temper may be guessed from its title. It describes from an ultra-Irish point of view the gradual conquest of Ireland and the acquisition of a great part of its soil by Englishmen. That Ireland owes whatever law, civilization, and order she has from time to time received entirely to the successive extensions and consolidations of English power; that the revolts of the Irish were the outbreaks of barbarism against the restraints of law and civilization; that their temporary success throw the country back for generations, and that their permanent triumph must have involved it in a relapse into utter barbarism from which only a French or a Spanish conquest could have enabled it to emerge; that the severities of the conquerors never equalled or approached the cruelties of the conquered rebels, are facts sufficiently notorious to those who know the true history of Ireland, but facts of which no one would obtain a glimpse in Mr. Amory's pages. Nevertheless, were the work confined within more reasonable limits, it might be worth the while of those who have gathered their ideas of Irish history mainly from Mr. Froude to learn that there is another side to the story, and to see how that story is told by a writer differing utterly from Mr. Froude in intellectual power, in descriptive skill, in knowledge, and in energy and clearness of expression, but not a little resembling him in one-sidedness and prejudice.

We hoped a great deal from a treatise on the "Galley Period" of naval construction and tactics† by an able and experienced officer like Commodore Parker. The work has therefore considerably disappointed us. The Commodore does not appear to have gained even as clear a notion of the structure of Triremes and Quinqueremes, of the successive tactics of Phœnician, Athenian, Carthaginian, and Roman fleets, and generally of ancient navigation, as is possessed by many scholars who have none of his professional advantages; and, even in dealing with the fleets and naval tactics of the middle ages, he seems to have taken all his information at second hand, and to have been satisfied to copy much of which, so far as his readers can judge, he has but an im-

perfect comprehension. To readers unacquainted with what is generally known upon the subject the treatise may serve as a convenient epitome of generally accessible but scattered information; but to those who have a general notion of the form and appearance of ancient and mediæval vessels, and of the manner in which they were handled in war and peace, Commodore Parker's volume can be of little service or interest.

Mr. Horton's treatise on silver and gold* deals at considerable length with the various questions that constitute what may be called the currency problem, treated from that point of view in which they chiefly appear to an American politician anxious for a *bonâ fide* resumption of specie payments. Mr. Horton does not belong to the stricter school of economists, but, on the whole, his views are sound both in policy and morality. He fully appreciates the mischievous effects of an expansive paper currency. He sees how impossible it is that American finance should ever rest upon a secure basis, that American industry should ever be free from alternations of inflated speculation and ruinous collapse, so long as American money derives all its value—and that a fluctuating and uncertain value—from the sanction of the Government and the artificial support of the law. Though he seems in several places and by many dubious expressions to excuse, if not to approve, the views of those who question the legal validity of the obligation to pay the debt in gold alone, yet, when distinctly dealing with the practical question of payment, he clearly declares himself in favour of specie redemption as the only course consistent with the understanding on which the money was lent, and with the repeated assurances given by the Legislature upon which the present value of American stocks depends. One of the weakest points of his theory is an inclination towards a double standard, arising apparently out of a notion that the steady decline in the value of the precious metals in the long run, and their special fluctuations from time to time, involve a wrong to those who have contracted for payment therein; and particularly that the demonetization of silver in Europe has been the main cause of its recent fall in value, and has inflicted consequently a serious wrong upon the silver-using nations of Asia. The latter, of course, retain all the wealth they have ever possessed, except such small portion thereof as may be represented by the depreciated metal, and Europe will not be able to purchase Asiatic produce one whit the more cheaply—that is, to pay for it one whit the less value in commodities—because it may take twelve rupees instead of ten to represent the sovereign. The work, however, will probably do good in a country where views much more dangerous than the worst of Mr. Horton's errors are commonly prevalent; and may be worth perusal on the part of European economists.

Mr. Thompson's treatise on the Papacy and the Civil Power† will gratify a large number of English Protestants, and perhaps a still larger number of Continental Liberals, by showing that in the country *par excellence* of religious liberty and equality there are many who regard the recent pretensions of the Papacy with almost as much alarm and impatience as they have inspired on this side of the Atlantic. There is more excuse for these feelings than may be apparent to those who have not watched closely the recent course of American politics. We believe that the Roman Catholics, who form a very numerous and powerful body in many parts of the United States, have of late shown a disposition to act as a solid political party, at least for the purpose of obtaining concessions to their Church on points of educational policy. It can hardly be a matter of indifference to any farsighted statesman that a large and thoroughly organized section of citizens possessed of full political privileges should act together under instructions received from a foreign Power, whether that Power be nominally sovereign or not. But Mr. Thompson fails as completely as many other Protestant and Liberal writers have done to perceive that Papal pretensions are, after all, merely pretensions to authority over the conscience. All that the strongest advocates of Papal claims have said of the supremacy of the Church over civil authority and law would be admitted in effect by Protestants if stated of individual consciences. The Pope himself does not pretend that disobedience to the law should not involve legal penalties. He only insists that Catholics must obey their consciences at the risk of civil penalties, and that their conscience must be guided by the Church. The former point being admitted on all hands, and the latter being an essential principle of Catholicism, there is nothing new in the claim, and nothing has been really added to it by the recent proceedings of the Vatican. If it were once recognized that this pretension, however insolently expressed, and however inconveniently asserted now and then on the field of practical politics, is but the same that has been put forward in all ages, and is in fact inseparable from the essential principle of Catholicism—the authority of the Church (or Pope) in matters of conscience—the alarm inspired by Encyclicals and Conciliar decrees might, we think, be reasonably pacified.

The Annual Report of the Smithsonian Institution‡, an endowed scientific body holding relations with the scientific departments of the Federal Government, and performing in America many of the

unctions of the Royal Society at home, always contains much that is interesting to English as well as to American readers. The most remarkable papers contained in the present volume are, one on the life and discoveries of Volta, who may be called the founder of modern electric science; an essay on the probable future of the human race, dooming mankind to gradual extinction, first by the exhaustion of our coal and iron, and, secondly and finally, by the gradual degradation of the continents, which is to leave us no land save that of volcanic islands; and some elaborate ethnological essays, of which the most valuable perhaps is that on the Stone Age in New Jersey, showing as it does that before the great civilizations of Central and Southern America, and probably before that of the mound-builders, there existed on the Western continent a stage of human progress marked by the same characteristics as that whose relics are preserved in the kitchen-middens of Denmark and the lake villages of Switzerland.

The study of natural history seems to thrive in America, if we may judge from the multitude of works on the local flora and fauna which constantly pass through our hands, many of them confined to very small provinces of inquiry, and yet indicating no inconsiderable amount of research and observation. Among these Mr. Minot's elaborate account of the birds of New England* is not the least interesting.

Among the departments of the Centenary Exhibition was one devoted to the medical department of the Federal army, of which detailed accounts may be found in a number of papers now before us.† The only one of these to which we need call particular attention is the address delivered by the surgeon representing that department, in which our readers will find an interesting account of the functions, practical and scientific, of the medical service of the Union, and of the arrangements made to ensure through its means the collection of a vast amount of information of all kinds—meteorological, climatic, ethnological, pathological—which cannot but afford useful material to the compilers of works in any one of the manifold branches of science upon which the officers of the department are required to inform themselves and their Government.

Mr. Stewart's little work on irrigation‡, while thoroughly practical in character, contains a considerable amount of curious and interesting information. In particular, the writer points out the reason why irrigation is so especially needed in America, though the rainfall there is much greater than in England, where irrigation is comparatively unnecessary. In this country the rainfall is comparatively slight at any one time, and is distributed with tolerable evenness over every season of the year. Mr. Stewart underrates its amount; but it certainly does not reach two-thirds of that which he assigns as the total rainfall of the Atlantic States. But on the other side of the ocean the rain falls very heavily at particular periods, generally during those months when the life of the vegetable world is least active. Thoroughly soaking the ground, it finds its way rapidly to the streams and rivers, by whose numerous channels it is carried back to the sea. The months during which the heat stimulates the vital functions of plants are for the most part months of comparative drought; and therefore, if no means are adopted for the storage and distribution of the winter rainfall, the crops suffer from want of their most essential nourishment, and fall very far short of those which, with a smaller but more evenly distributed supply of water, are obtained from less fertile soils in England. Experiment, and the comparison of the crops obtained with different quantities of water, seem, according to Mr. Stewart, to show that the larger the supply of water the greater the amount of solid produce for every pound of moisture supplied.

Mr. Putnam's volume entitled *The Best Reading*§ is only a classified list of those books on various subjects which the editor conceives to be the best worth reading, and contains such a multitude of names that it is obvious that only in regard to a fraction of the entire number can he have received any information, even at second-hand. His guidance, therefore, cannot be of much value, and, such as it is, it is confined almost entirely to recent publications.

Mr. Marsh's *American Guide to London*|| is, of course, chiefly intended for his countrymen; but it may perhaps be of some little service to Londoners, who are apt to know as little about the interesting objects and institutions of their own city as is known even by foreign visitors who see it for the first time.

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

The publication of the SATURDAY REVIEW takes place on Saturday Mornings, in time for the early trains, and copies may be obtained in the Country, through any Newsgent, on the day of publication.

THE SATURDAY REVIEW

POLITICS, LITERATURE, SCIENCE, AND ART.

Price 6d.

CONTENTS OF No. 1,126, MAY 26, 1877:

The War. Germany and France.
Whig Reforms and Agrarian Apitition.
The French Ministry and the Dissolution. Serbian and Roumanian Jews.
The Clyde Shipbuilders' Lock-Out. The Transvaal Annexation.
The Cattle Plague and Foreign Meat.

Intellectual Women.
The Grand Rope of the Cataract. Flower Services.
Will the Present Depression Last? The Alma of St. Katharine's Hospital.
Theatre Royal Beau-Idéal. Indian Prisons. The Operas.

Wright's History of Nepal.
Switzerland and the Swiss. Paterson on the Liberty of the Subject.
Lights and Shadows of Spiritualism. Hillebrand on the Moors. L'Art.
Helps to the Greek Classics. Murks on China.
Minor Novels. American Literature.

CONTENTS OF No. 1,125, MAY 19, 1877:

The Debate—The Crisis in France—German Parties—Mr. Bright at Exeter Hall—The Biddable Judgment—Politics at Whitstide—Inebriate Reformatories—The Independence of Indian Judges—The Burials Bill in the Lords.

Some Aspects of Chantry—Modern Archery—The Discoveries at Mycenæ—Mr. Gladstone and the Liberal Party—The Steam Tramways Delusion—The Chapter of St. Katharine's Hospital—Breaking the Sabbath—Scurvy in the Arctic Expedition—The Royal Academy. 111.

The Life of Lord Abinger—A Trip to Cashmere and Ladak—Alfred de Musset—The Cheveley Novels—Stephen's Digest of the Criminal Law—Marshall's History of France—His Second Wife—German Literature.

London: Published at 38 SOUTHAMPTON STREET, STRAND, W.C.

ADVERTISEMENTS.

MUSICAL UNION.—PAPINI, last time; SAINT SAKNS, first time this season, Tuesday, May 29. Quartet, D minor, Mozart: Trio in F, Saint Quirici, No. 1, in D, Beethoven; Solos, Violin and Piano-forte. St. James's Hall, Quater-past Three. Tickets, 7s. 6d. each, to be had of Lucas & Co. and Ollivier, Bond Street and Austin, at the Hall. Visitors can pay at the Regent Street entrance.

Professor ELIA, Director.

PHILHARMONIC SOCIETY.—Conductor, Mr. W. G. COUSINS. Monday Evening, May 28, Half-past Eight, St. James's Hall, Spohr's "Tower of Sound," Symphony; Overture, "Lynceus," Beethoven; Overture, "Fannyhuser," Wagner; Wagner's "Venus Concerto"; Violin, Herr Ludwig Straus. Vocalist, Madame Campobello. Stalls, 10s. 6d.; Tickets, 7s. 6d., 5s., and 2s. 6d.

DORIS GREAT WORKS, "CHRIST LEAVING THE PRÆTORIUM," and "CHRIST ENTERING JERUSALEM" (the latter just completed, and by 22 feet), with "Drama of Pilate's Wife," "Christian Martyrs," &c. &c. at the YORK GALLERY, 15 New Bond Street. Daily, Ten to Six.

FILIJAH WALTON.—EXHIBITION OF WATER-COLOUR DRAWINGS. 1. GYPSE, NUBIA, and the Nile, with a number of fine Alpine and other Works. NOW OPEN at Burlington Gallery, 191 Piccadilly. Ten to Six. Admission, including Catalogue, 1s.

THE SOCIETY OF PAINTERS IN WATER COLOURS.—THE EIGHTH EXHIBITION IS NOW OPEN. 5 Pall Mall East. From Nine till Seven. Admission 1s. Catalogue, 6d.

ALFRED D. FRIPP, Secretary.

HORSE SHOW, AGRICULTURAL HALL, Islington.—The SHOW OPENS Saturday, June 2. Hunters Judged and Poles leaped. Admission 2s. 6d.; other days, 1s. Monday, June 4, Harness Horses judged and parade of Commanded Horses. Tuesday, 5, Wednesday 6, Thursday, 7, Friday, 8. For Programme see daily Advertisements. Doors open at Ten o'clock.

By Order, S. SIDNEY, Secretary and Manager, Agricultural Hall Company, Limited.

HORSE SHOW, AGRICULTURAL HALL, Islington.—RESERVED SEATS in the Balcony to View Parades and Leaping, 10s. and 5s., may be engaged from a numbered Plan on and after Monday next, May 28. UNRESERVED SEATS, 2s. 6d. and 1s.

UNIVERSITY OF LONDON.—Notice is hereby given, that the next HALF-YEARLY EXAMINATION for MATRICULATION in this University will commence on Monday, June 25, 1877. In addition to the Metropolitan Examination, Provincial Examinations will be held at Owens College, Manchester; Queen's College, Liverpool; Queen's College, Birmingham; St. Catharine's College, Oxford; St. John's College, London; and St. Stanislaus' College, Tullamore.

Every Candidate is required to transmit his Certificate of Age to the REGISTRAR (University of London, Burlington Gardens, London, W.) at least fourteen days before the commencement of the Examination.

May 24, 1877.

WILLIAM B. CARPENTER, M.D., Registrar.

FETTES COLLEGE.—SCHOLARSHIPS.—Four of £60 per annum. Competition in July.—Apply for particulars to HEAD-MASTER, Fettes College, Edinburgh.

"LAURENCE SAUNDERS" SCHOLARSHIP.—

NOTICE is hereby given that the next Examination for this Scholarship (founded in memory of Laurence Saunders, who suffered martyrdom at Coventry, in the reign of Queen Mary), will be held at Clifton College, on Wednesday, Thursday, and Friday, September 5, 6, 7, next. Candidates, whose age must not exceed eighteen on the day of the examination (September 10, 1877), must furnish the Trustees with satisfactory evidence of moral character. The successful candidate must within two weeks after the said September 15 furnish the Trustees with an undertaking in writing forthwith to commence, or continue, his studies at one of the Colleges at Oxford or Cambridge; or at University College, London; or at the Royal College, London; or at Owens College, Manchester. The Scholarship, which is of the annual value of £60, is tenable for four years, but shall be vacated if the holder thereof shall refuse to reside in or study at one of the aforesaid Colleges with due diligence, and to the satisfaction of the Trustees. In making the Election, the Trustees will give a preference to Candidates born at, or residing at Coventry, or within five miles thereof. Papers will be set in the following subjects, viz.: Greek—Medes of Euripides; Herodotus, Book viii.; Latin—Ucero de Amicitia; Horace, Odes, Book I.; Latin Prose Composition; Greek and Roman History; Mathematics—Euclid, Books I. to vi. and xi.; Arithmetic; Algebra; Plane Trigonometry to the Solution of Triangles; Geometrical Conic Sections; English History; English Language; English Literature (Elizabethan Period, 1580 to 1625); Cream's English Constitution. Notice of intention to compete for the Scholarship, together with all necessary certificates, must be forwarded to JOHN F. NORTON, Barrister-at-Law, Aldon Chambers, Bristol, on or before August 8 next.

CLIFTON COLLEGE.—ENTRANCE SCHOLARSHIPS.—£25 to £50 a year. Examination begins Wednesday, June 20. A Scholarship may be won by proficiency in Classics or Mathematics, or Natural Science, or French and German, with English.—Apply to HEAD-MASTER or SECRETARY, Clifton College, Bristol.

MR. GLADSTONE AT BIRMINGHAM.

MR. GLADSTONE'S speech at Birmingham was not the most eloquent which he has delivered on the Turkish question; and in some respects it was the most violent and most uncompromising. In the latter part of his address he recurred to the denunciation of the Turkish nation and the Mahometan religion which excited the enthusiasm of his followers and the surprise of dispassionate politicians when he first expressed similar opinions or feelings in his earliest pamphlet on the Eastern question. The objection to his language is not that his statements are necessarily untrue, but that the only practical conclusions to which they lead are untenable and mischievous. Lord STRATFORD DE REDCLIFFE, whose late comments on the present crisis were quoted by Mr. GLADSTONE, adopts a different and opposite tone. He says that he has not materially changed the opinions which are expressed in the substance of his communication, which was written in 1863. "Should any aggression," Lord STRATFORD then said, "be made on the territories or national independence of Turkey, we could not in honour reject the appeal which would doubtless be made to our good faith, even if it were to involve us in hostilities with an aggressive Power or an aggressive coalition." As a precaution against such a danger, Lord STRATFORD urged on the Government the duty of counteracting as far as possible the causes of Turkish decay. At present Lord STRATFORD "would not be extreme in visiting on Turkey the entire responsibility for these lapses in good faith and discretion, especially when I look in vain for signs of any serious endeavour on the part of Europe to check the course of Turkish impolicy and neglect of the Porte's obligations during its fatal progress under the sway of Sultan ABDUL-AZIZ." During the greater part of that reign Mr. GLADSTONE was a principal member of the English Government; during five years of the time he was Prime Minister. He may perhaps be justified in adopting in Opposition a policy directly opposite to that for which he was responsible in office; but a tardy convert might be more tolerant of heresies which he has but recently abjured.

Mr. GLADSTONE has apparently no policy to propose except a joint coercion of Turkey, which has ceased to be practicable since the commencement of the Russian invasion. When forcible measures would still have been possible if the concert of the neutral Powers could have been obtained, Mr. GLADSTONE never formally and directly proposed active interference. Even now he is so far restrained by the scruples and responsibilities of a statesman that he gives no open sanction to the reckless violence of the demagogues whom he condescends to lead. The Rev. Mr. DALE, hitherto principally known by his antipathy to the Church Establishment, epigrammatically announced that he was for peace at any price, even at the price of war. The insincerity of professed philanthropists has seldom been confessed with equally cynical candour; but, on the other hand, some credit is due to politicians who accept the logical consequence of their doctrines. The present Ministers are, as Mr. DALE sarcastically observed, not members of the Peace Society; but they are supported by the vast majority of the House of Commons in their refusal to engage in a wanton and unjust war. Mr. GLADSTONE and the party with which he has now associated himself openly profess to appeal from Parliament to the people, and Mr. GLADSTONE himself suggests that the

decision would be most conveniently given as the result of a dissolution. If the proposal is seriously made, it may be replied that no precedent can be found of a dissolution conceded at the instance of political adversaries by a Government which, having an ordinary working majority, finds its numbers doubled in a division on the issue which would at a general election be submitted to the country. The main difference between constitutional and democratic principles consists in recognition of the supremacy of Parliament. Mr. GLADSTONE has often inclined to the system which found its fullest expression in the plebiscites which the late French Emperor employed to counteract the independent tendency of Parliamentary institutions. The multitude is for the moment on his side; but England is not yet governed by a miscellaneous show of hands.

Mr. DALE repudiated the obvious inference which has been drawn from Mr. GLADSTONE's visit to Birmingham, that he has pledged himself to the subversive principles and the narrow exclusiveness of the local Liberal Association; but the fiction of abstaining from a formal and verbal alliance is too transparent to be worth maintaining. The promoters of the meeting publicly announced the connexion between Mr. GLADSTONE's participation in the proceedings and the federal union of Clubs which are, if possible, to inflict on the hostile party throughout the country permanent political disabilities. Mr. GLADSTONE's attention may perhaps be for the moment concentrated exclusively on the Eastern question; but his allies at Birmingham, while they share his antipathy to the Turkish system of government, are bent on turning the excitement caused by the fervour and the eloquence of their leader to domestic purposes. Mr. CHAMBERLAIN makes no secret of his political objects; nor can Mr. GLADSTONE persuade himself that his presence at Birmingham has no relation to movements which have nothing to do with the Bulgarians. The proposed federation of Liberal Clubs is an attempt to govern the country by the agency of a gigantic political union. In countenancing such an organization Mr. GLADSTONE necessarily places himself at its head. He may perhaps still persist in his intention of not resuming his former position in Parliament; but when he takes the chief part in a permanent popular agitation, he will seriously embarrass his successor on the front Opposition bench. If PERL, after his retirement from office, had become the rival or successor of O'CONNELL, he would have anticipated the career which seems to be meditated by Mr. GLADSTONE. The essential doctrines of the enlarged Birmingham Association are not professed by Mr. GLADSTONE's former colleagues. Mr. CHAMBERLAIN, in an essay published three or four years ago, urged on the new Liberal party the expediency of devoting their first efforts to the disestablishment and disendowment of the Church of England. Changes in the representative system, in the laws which regulate the tenure of land, and in nearly all the institutions of the country, will follow in due order. The machinery of the proposed revolution is in itself highly objectionable. Government by a Club or association of a majority united in political opinion has long since been firmly established at Birmingham. The adverse party, though it probably possesses a large share of the property and intelligence of the community, is, as far as possible systematically excluded from all local influence and municipal activity. The first principle of the federal compact to which Mr. GLADSTONE has

pledged himself is deliberate intolerance. Birmingham Liberals have not yet demanded the exclusion of Conservatives from courts of justice, but they allow the conquered sect no share in government or administration. With an extended suffrage exercised in equal electoral districts, the House of Commons would perhaps become a Committee of the federated Clubs. Those who are curious to understand the principle of the Birmingham Association may find in the February number of *Macmillan's Magazine* a lucid exposition of the entire system by the Rev. Mr. CROSEY, himself a leading member of the body. The Conservatives at Birmingham are reduced to the condition of the Catholics before 1829, and the apologist or eulogist of the Association betrays an amusing unconsciousness of the political bigotry of himself and his associates. A citizen of Birmingham who wishes to share in the administration of municipal affairs, or in the control of the funds to which he contributes, must make up his mind to approve of the disestablishment of the Church, of the uniformity of the franchise, of some undefined alternation of land tenure, and, as it would appear, of war with the Turks. Above all, though tests are supposed to have been long since abolished, the candidate for civic activity must believe that Mr. GLADSTONE ought to be Prime Minister, and that the Turks should be the objects of immediate war.

It remains to be seen whether, after taking the lead in a formidable agitation, Mr. GLADSTONE will still assume in the House of Commons the character of a private member. It is generally understood that, if he had pressed his Resolution to a division, Lord HARTINGTON would have resigned his position as leader of the Liberal party. He and his colleagues cannot but feel that, as long as Mr. GLADSTONE controls a large and active section of the party, the exercise of Lord HARTINGTON's legitimate authority must be extremely difficult. It is possible that the end of the Session may be rendered memorable by a disruption and coalition of parties.

THE WAR.

EVEN if it had been true that the Turks or their Kurd auxiliaries had retaken Ardahan, the Russian army would probably be strong enough to continue its advance on Erzeroum. The campaign in Asia and the preparations on the Danube seem to indicate a deliberate purpose to be accomplished by the employment of irresistible numbers. The Turks probably retain their ancient valour, although it is said that the Governor of Ardahan and his officers disgraced themselves by a precipitate surrender; but the great improvements in the art and practice of war which have been introduced within twenty or thirty years all tend to ensure more certainly than in former times the victory of the richer and stronger belligerent. Danger is closing round the Porte on every side. The fall of the Greek Ministry is the result of its supposed policy of peace, and the King is threatened with popular tumults if he fails to appoint a Cabinet of more warlike propensities. Although no cause of offence has been given by the Porte, there will be no difficulty in picking a quarrel. The Greek kingdom has neither an efficient army nor a formidable fleet; but it can promote insurrections in the neighbourhood of its Northern frontier, and it can perhaps cause a rising in Crete. The real motive for a possible attack on Turkey would be anxiety to share the distribution of territory which must ensue if the Turkish Empire is overthrown. The Greeks bear little good will to the Russians; but they are not disposed to waive their claim to Epirus, Thessaly, and Crete, or perhaps to Constantinople itself. Another supplementary attack is apprehended on the side of Servia. The ambiguous language of the Russian Government is consistent with secret agitation by the Slavonic Societies; and indigenous agitators are not backward in urging Prince MILAN to action. The Servians, like the Greeks, are anxious not to forfeit their claim to a share in the expected plunder. It is true that they were during the winter rescued from imminent danger by the peace which was granted on extremely liberal terms. They have since had neither injury nor offence to complain of; but where the carcass is expected to fall, birds of prey, small and large, gather together.

A Roumanian writer has published a plausible apology for the co-operation of his Government with the Russian

invader. He perhaps lays too much stress on the obstinate refusal of the Porte to concede independence to a nominally subject province. No change in forms and titles would either have delayed the Russian passage of the Pruth, or have materially affected the subsequent arrangements. The Russian Government would assuredly have disregarded as a fictitious contrivance a declaration of independence on the eve of a war. An ambitious Power meditating a neighbouring conquest will always claim a right of way over intervening territory which is not protected by a competent force. If the Turks had been careful to put the Roumanians technically in the wrong, they would perhaps not have treated the Convention with Russia as a hostile act; but in the course of a few weeks collision would have been unavoidable; and the towns and villages on the left bank of the river which were from time to time cannonaded are probably now occupied by Russian troops. Politically, as well as physically, the larger mass attracts to itself all neighbouring particles of matter. Greece, Servia, Roumania, and Montenegro all obey, or will soon obey, the impulse of Russia. It is not surprising that discontent and alarm produce popular commotions at Constantinople. The Parliament which is still sitting sometimes remonstrates against the maintenance in power of unworthy Palace favourites; but the SULTAN's brother-in-law and the MINISTER OF WAR have hitherto succeeded in defying general indignation. An incapable COMMANDER-IN-CHIEF is retreating through Asia Minor before the superior force of the enemy; and it is not known that any competent general directs the defensive operations on the Danube. A certain amount of energy has been shown in the despatch of Circassian volunteers to the North-Eastern shores of the Black Sea; but the best authorities hold that no movement in the Caucasus can threaten the Russian forces in Armenia with serious danger. The promised neutrality of Persia cannot be implicitly trusted by the Porte; but of all the expected allies of the Russian invader, the Persians would be the most inexcusable if they shared in the destruction of a Mahommedan Empire.

The magnitude and completeness of the Russian armaments, and the vast scale of the impending operations, sufficiently confute the theory of minute critics who attribute the present war to casual diplomatic failures or mistakes. Nothing can be more improbable than that the Russian Government would have been diverted from its present course by any change which could have been introduced into a Memorandum, a Note, a Protocol, or a Declaration. The only sufficient impediment to a predetermined rupture would have been the opposition of one or more of the Great Powers to Russian aggression. The assurance of English neutrality was obtained by a rare union of adroitness with good fortune; and as Austria also was unprepared for active resistance, the army which began to assemble in the autumn was launched against Turkey on the first approach of spring. It may easily be believed that the Emperor ALEXANDER occasionally hesitated to engage in a perilous adventure. It was said on credible authority that he deeply resented the English agitation which removed the last obstacle to the completion of his enterprise. During the fifty years which have elapsed since the conclusion of the Treaty of Adrianople there has not been a period of five years during which Russia would have hesitated to invade Turkey if the neutrality of Europe could have been, as now, secured. The Emperor NICHOLAS tried the experiment prematurely, with the result of ascertaining at a heavy cost the conditions of success which are now for the first time satisfied. The incessant intrigues which have occupied the intervening time have furnished the Turkish Government with its only shadow of excuse for the continuance of provincial misgovernment. The SULTAN's successive Ministers have always known that their only safeguard against Russia lay in the prudent jealousy of Europe. No possible reform would have protected them against their ambitious neighbour, except through its tendency to conciliate the good will of England. Unfortunately they did the work of the enemy by alienating the confidence of their natural ally and protector.

A political fanatic who concentrated his energies on one side of the Eastern question has died at the moment when the Turkish Empire is perhaps verging on its agony of dissolution. Mr. UTCHART had for fifty years denounced Russian designs with an extravagance which injured his cause by making it ridiculous. His only

remarkable gift was a facility in learning languages, which he mistook for a capacity of acquiring accurate knowledge. Because he had the rare accomplishment of understanding Turkish, he fancied that he correctly appreciated the Turkish character. He could not properly be called a charlatan, because he was not intentionally an impostor. He was sincere, as far as honesty is compatible with persistent self-deception founded on extreme personal vanity; and, although he was utterly devoid of the faculty of reasoning, the central conviction from which he never deviated was substantially true. The proposition that Russia was the most formidable enemy of justice and civilization branched out in Mr. URQUHART's morbid imagination into the most whimsical corollaries. His secondary doctrine was that Lord PALMERSTON was the paid agent of Russia, one service which he performed for his employer being the losses deliberately inflicted on England in the Crimean War. The mental unsoundness which is the indispensable qualification of a false prophet enabled Mr. URQUHART to form and direct a faithful little sect of like-minded disciples. His followers established clubs in two or three large towns, under the name of Foreign Affairs Committees, which from time to time published expositions of the perfidy of Russia and the treason of PALMERSTON. In one Parliament Mr. URQUHART obtained seats for himself and for Mr. ANSTAY, who was then his principal follower. After a session or two of woe Lord PALMERSTON judiciously bought off one of his assailants by an official appointment; and Mr. URQUHART, who was incorruptible, soon lost his seat in the House of Commons. The fragments of his sect lately existed, but any remnant which may survive will probably now disperse. Those among them who may still remain faithful to their eccentric teacher may now fairly quote the warnings which he addressed in vain to an incredulous generation. His fantastic belief in the superior wisdom and goodness of Oriental and Mahometan races was peculiar to himself and his credulous devotees; but no exaggeration could falsify his habitual assertion that the aggressive and perfidious policy of Russia was never intermitted. CASSANDRA was not altogether in her right mind, but her ravings contained an admixture of truth.

THE SCOTCH CHURCHES.

THE two Scotch Churches hold their Assemblies at this time of year, and there is always much to interest the outside world in their proceedings. Both institutions appear to be flourishing, pushing forward their boundaries, and exulting in their own zeal. Both have their difficulties, however; and they are difficulties which even Scotch fervour and the extreme liberality with which the Scotch support every ecclesiastical arrangement which takes their fancy or enlists their sympathies do not suffice to surmount. In meetings of the Established Church there has been, for instance, an instructive discussion as to the supply of ministers. It appears that the supply of youthful shepherds is scarcely equal to the demands which, if not the flocks, yet those who wish the flocks well, perceive to exist. It was proposed that an attempt should be made to remedy the want by devoting new funds to the support of students for the ministry. But this was loudly denounced as a mere means of bribing young men to take up a line of life for which they had no vocation, and the adoption of which they would hereafter bitterly regret. Nor was it considered at all certain that the bribe would be effectual. The young Scotchman to whom it was offered would, it was suggested, make a calculation with the traditional shrewdness of his country, and would be only too likely to prove to himself that, on the whole, the line proposed to him would not pay. It is true that he would get for a short period of his life the modest lodging and moderate sustenance which enable young Scotchmen to pursue their studies; but when that period was over he would have nothing before him but a hundred a year and a humble position in the world. To study divinity, even if the study cost him nothing, would seem to him a very unremunerative investment. It was therefore urged that the true way was to begin at the other end, and to make the life of the minister more easy and more attractive. Unfortunately, it seems to be allowed to be too bright a dream that the stipends of the ministers can be much increased. The heritors on whom the legal duty of supporting the established clergy lies are not at all inclined to go beyond their legal

duties. In fact, the heritors are in many cases stumbling-blocks and rocks of offence in the paths of ministers, and even assert hereditary claims which distress and vex their pastors. One minister brought to the notice of the Assembly his own sad case, and invited the sympathy which a clerical audience was sure to bestow, when he informed his hearers that his heritors claimed to own a great part of the body of his church and let out the pews for their own benefit, so that he, as it were, cheated himself, and the better he preached the less it cost to keep him. If the life of the minister is not to be made more easy, is there much hope of its being made more attractive? By being made more attractive is meant, in simple language, being made more fashionable. If only the minister while he starved could be sure of being considered a starving gentleman, he might think that poverty had its roses as well as its thorns. But the most experienced members of the Assembly acknowledge with a sigh that there is not much chance of this. The Scotch minister has not, as such, any place in society whatever. His heritors, even in their kindest mood, merely patronize him, and, as a member of the Assembly remarked, the richer members of the establishment, although they will freely give their money to the Church, positively decline to give their sons to it. Religious zeal in Scotland can do many things, but it cannot induce gentlemen to let their sons be ministers.

But neither poverty nor the want of social position is the chief barrier to the supply of Scotch ministers. There is another cause which cannot fail to operate. A young man, unless the solid and unwavering experience of years has assured him that under no circumstances will he ever be tempted to use his mind, may naturally tremble at the thought that he may one day be brought to the bar of the General Assembly. Dr. SMITH, well known as a Biblical scholar of very moderate opinions, has been going through this ordeal this week. He has lately written two articles in an Encyclopædia which have excited suspicion. It was not quite clear that he was really and unimpeachably sound on the age of the Book of Deuteronomy, or on the nature of angels, or on the authorship of one of the Psalms. It was also not quite clear that he was unsound. His language in the articles in question was such as to leave his Free Church readers in a state of discomfort. If they could not scent the rose of heresy in his works, they could scent a person who had been the rose's neighbour. Accordingly, after the fashion of the Scotch Churches, the Presbytery brought to bear on him the awful artillery of skilful questions:—What did he think about this, and what did he think about that? The Free Church of course has not at its disposal all the machinery which the Established Church has at its command. A case was brought to the notice of the Assembly of the Established Church in which, when it was discovered that a witness who was being "tortured" with questions by a Presbytery declined to answer them, it was proposed to call in the Sheriff to make him open his lips. The censures and proceedings of the Free Church are purely spiritual, and it was open to Dr. SMITH to answer or not as he pleased. He took a middle course, which was quite in harmony with the dictates of worldly prudence, but which was in its way vexatious. He answered the questions in the shortest possible way, and in one instance answered a subtle question several lines long by the simple monosyllable "No." What the Free Church Assembly was asked to sanction, and what it did sanction, was that new questions, framed with greater ingenuity, should be administered to Dr. SMITH; and this time it may be expected that he will have his latent heresy wrung out of him, if there is any latent heresy to be wrung out. There was also a further question which was discussed by the Assembly with the greatest warmth, and at a length which even a Scotch Assembly seems to have considered rather alarming. Dr. SMITH suggested that if it was thought that he had been guilty of heresy, a distinct charge of heresy should be made against him, the effect of which would be that as soon as the libel was found to be relevant—that is, worth considering—he would be suspended from teaching his classes. But this did not suit the views of the majority of the Assembly. It was not of heresy that they were complaining, but of a faint and delicate flavour of heresy. The perception of this flavour was to their keen senses a present and immediate fact. They could not wait for there was nothing to wait for. The only question in their minds was whether they did or did not

feel a sort of pangency in the ecclesiastical air when they came across Dr. SMITH and his literary productions. There could be no mistake about it. They had the sensation they described, and so they decided that Dr. SMITH should be suspended from teaching without further delay.

We do not see that the General Assembly was in any way to blame. They thought that they were doing something which it was very right, necessary, and wise to do. They were keeping their Church clear, not only from a taint, but from the taint of being suspected of having a taint. The machinery of asking a minister any question which any of the pillars of the Church think most calculated to make him say exactly what he thinks about anything as to which there is any doubt what his opinions are is the machinery which the constitution of their Church provides. A man may choose whether he will be a Free Church minister or not; but, if he accepts the position, he knows, or ought to know, what it involves. As a mode of extirpating heresy in its faintest and most feeble beginnings, it seems to be a very efficacious and lively piece of machinery. It must tend to discourage men from writing on theological subjects at all, and then, if they do not write anything, they cannot write heresy. From the point of view of the Free Church this is quite right. And it is very unjust to condemn an institution for not being what it has never pretended to be. There is no sense in saying that it is illiberal, for the Free Church does not pretend to be liberal; or that it is a despotic, harsh, and arbitrary way of treating a minister, for this is the way in which, by its constitution, the Free Church has to treat its ministers. All that can be said is that this relation between the Church and its ministers constitutes what may be supposed to be a powerful reason for the opinion apparently prevailing among young Scotchmen that the life of a Scotch minister is not an easy or attractive one. If a young man says that he does not want an easy or attractive life, that in all probability he will never write anything, and that, if he does, he will not mind how many questions are asked him, he may adopt the useful and honourable calling of a Free Church minister with a light and cheerful heart, and may hope to contribute something to the furthering of the good work which the Free Church carries on with so much ardour and success.

THE UNITED STATES AND MEXICO.

THE Cabinet of Mr. HAYES has at last made up its mind that the raids of Mexicans into Texas shall be stopped, and has intimated to the *de facto* Mexican Government that after a certain date the commanders of the American troops will cross the frontier stream of the Rio Grande, pursue the marauders on to Mexican soil, and bring them back into the territory of the United States for punishment. This is only one phase of a dispute, or series of disputes, that has been going on for a long time. The border districts of Texas and of the Northern States of Mexico have been in the condition in which the border districts of England and Scotland were in old days. On both sides of the Rio Grande cattle-raising has been the pursuit, and cattle-lifting the recreation, of wild and lawless men. Texas has been always complaining of Mexico, and Mexico of Texas, and both had no doubt ample cause of complaint. But in this long-continued raid the balance of trade, so to speak, has been on the side of the Mexicans. They have carried off more cattle than they have lost. An immense volume of claims was made on either side, and, when the two Governments referred these claims to an arbitral Commission, it was pronounced that Mexico owed and must pay America a million sterling. Other claims than those arising out of cattle-raids entered into the account; but cattle-lifting was the chief ground of claim, and the transactions must have been on a very imposing scale when a million sterling only represented the balance due from the side that had triumphed to the greatest profit. The United States Government very naturally and properly wishes to stop such a state of things; but it is difficult to say how it is to be stopped if the Mexicans who make expeditions are not to be followed over the river. The frontier is so enormously long, and the posts of the American troops are so few and far between, that it is impossible that the Mexican robbers can be prevented from crossing into Texas or can be caught and handed before they get back into their own happy

country. If the Texans are robbed, it is scarcely to be expected that they will not retaliate. Texas, no doubt, is a very lawless place; but still the American Government has done something to make things better there than they were, and it may gradually hope to do more. It probably by making examples would discourage the bold citizens of Texas from pursuing their favourite sport on the other side of the Rio Grande. At any rate it is ready to offer to do this. Texans shall not go into Mexico if Mexicans will not come into Texas; but the Mexicans must do their duty in return, and must stay religiously within their own boundaries.

The Mexican Government ought obviously to charge itself with the task of preventing its citizens from persisting in their depredations. But the Mexican Government has other and nearer things to think of. It has to exist, and that is no easy matter. The present Government is that of PORFIRIO DIAZ, which has now retained power for six months. For the moment there is no opposition to it, and an election has been held which has constituted PORFIRIO DIAZ President in regular form. It is not by any means a bad Government in its way, and does its best to secure order, develop trade, and win confidence. In spite of its revolutions, Mexico is making indisputable progress. Its exports are increasing, and this shows that the enormous resources of its soil are being turned to better account. Business is better generally, and the reported discoveries of silver in the United States have not brought down the metal to a price which is likely to make the working of Mexican mines unremunerative. But the Government has great difficulties to contend with. The mass of the people would be very willing to see it continue; but it has a determined opponent to deal with in the ex-President LERDO, who is at present in the United States, where he has many friends; and his claims to be restored to what he contends is his legal position are thought to be so strong, that the United States Government, in addressing the Government of PORFIRIO DIAZ on the subject of the Texas raids, has carefully guarded itself against the deduction that it was thus recognizing the Government it addressed. It will not pronounce between the rival Presidents. All it does is to invite the President who happens to be in possession to restrain persons whom he affects to govern from harrying the property of American citizens. But he cannot do this without having in his pay troops on whom he can rely. His Government has only too many troops at its disposal, but it cannot pay them without ruining the country, and it has undertaken that the sums expended on the army shall be reduced to a comparatively small amount. Nor would it feel perfectly easy in having a large body of troops stationed in the Northern States. The Rio Grande is more than a thousand miles from the capital, and a general in command of an army so far away might be tempted to set up for himself, or to listen to the overtures of the rival President. The Government of PORFIRIO DIAZ is no doubt very anxious to avoid giving any cause of offence to its powerful neighbour, and even in the time of its worst financial straits it found the means of paying the first instalment due on the amount awarded as an indemnity. It would be very glad to keep the citizens of the Northern provinces from plundering Texas, if only it could see the way to do so. But there is no apparent prospect of its being able to give effect to its good intentions; and, in face of this powerlessness of the Mexican Government, the American Cabinet has very justifiably decided to take the law into its own hands.

But it is evident that the Government of Mr. HAYES by no means relishes the task which it thus imposes on itself. It makes its demand with as little peremptoriness as possible. It shows nothing like a desire to prey upon or humiliate a weak neighbour. Nothing is to be done at present, and a considerable time must elapse before an American soldier will cross the Rio Grande. The Mexican Government is to have abundant opportunity to consider what it will do and what it can do. It is only when it has practically confessed that it can do nothing that the troops of the United States will be charged with their new duties. Even if an American commander does cross the Rio Grande, seize on a band of alleged offenders, and bring them for trial to the States, there will be no desire on the part of the American Government that this should be the beginning of a serious invasion. To annex one or two of the Northern States of Mexico can be no kind of benefit to the Americans. They would merely get more land when they have plenty

enough, and more restless people to tranquillize, when they have already too many. The annexation of Mexico generally would perhaps be profitable as a pecuniary speculation, but would be disastrous politically; and no American of any prominence is blind to the enormous danger of bringing within the pale of American suffrage some millions of Catholic Indians. Still Mexico is so near, it excites so much interest in the States, it occasionally gives so much trouble, and so very much might be made of it if order could be secured in it, that it is not surprising to find that some Americans have set themselves to think whether the United States could not interfere in Mexico without annexing it or any portion of it. An article in the *Washington Review*, written by an author who is not without influential connexions, has lately suggested to anxious Mexicans that something else than annexation may be in store for them. The suggestion of the article is that the United States should leave Mexico to the Mexicans, but should exercise a protectorate over it. The history of India shows that this is what England would probably do under similar circumstances. The benefit to Mexico would be very great, and as soon as the protectorate was established, the perception of the benefits they derived from it would probably soon reconcile the Mexicans to any humiliation they might suppose it to inflict on them. Whether there would be any serious resistance to its establishment is purely a matter of conjecture; but there is a sufficient probability of such a resistance to make a prudent American consider very carefully whether the game would be worth the candle. The real objection to the protectorate seems to be that it does not appear to be in harmony with American institutions. Great aristocracies, like those of England and Rome, can govern dependencies or establish protectorates, for they possess the proper machinery for the purpose. There is always some one in England fit to be Viceroy of India, and the man who has been Viceroy of India returns to take his natural place in English society. But at a democracy neither produces the men fit for such a task nor would endure them without jealousy when their term of authority was over. No doubt there are many Americans who, with a little of the training of experience, would learn to exercise a protectorate with firmness, justice, and a sincere regard for the interests of the protected Power; but such men would, if called on to show their aptitude for government, be regarded, and could scarcely help regarding themselves, as outside the pale of ordinary American society, and their eminence could hardly fail to be considered as a source of possible political danger.

FRANCE.

THE French crisis has passed into an extremely sluggish stage. It is plain that nothing new is to be looked for during the month for which the Chambers are prorogued. Marshal MACMAHON is daily provided with a policy in the columns of hostile or friendly newspapers; but there is no reason to suppose that he has yet invented one for himself. That he means to appeal to the country in some way may be taken as certain; but the particular mode in which the appeal will be made, and the precise extent to which it will be allowed to pledge his future action, are matters which will perhaps be decided for him by his advisers. It is still doubtful whether the majority in the Chamber of Deputies will oppose or welcome a dissolution. Both courses find supporters in the Republican press, and the pleasure of defeating M. DE BROGLIE in the Senate, as well as in the Chamber of Deputies, would of course be very great. But the latest supposition seems to be that the majority will take the most obvious and constitutional method of showing their want of confidence in the Ministry imposed on them by the MARSHAL, and will refuse to vote the supplies. In that case they cannot well object to a dissolution. The Ministry will contend that they have the country with them, and they may fairly challenge the majority either to admit their claim or to give them the opportunity of making a good majority in the Chamber of Deputies refusing to discuss the Estimates, and a majority in the Senate refusing to let the constituencies show by their votes whether, in so returning their representatives expressed their real mind, could not possibly co-exist for long.

Why the Senate was invested with a veto on a dissolution was a subject of the pieces of the new French Constitution.

tion. But though the exercise of this veto is subject to no express limitation, it will necessarily be restricted in practice. If the Executive professes itself anxious to take the opinion of the electors, the Senate ought not to offer any opposition, unless it is quite clear that the only motive for a dissolution is to get rid of Parliamentary control. There is nothing to show that this will be Marshal MACMAHON's motive. He apparently believes that the deputies are very much more Radical than the electors who have returned them; and that many of those who are now opposing him owe their election to the magic of his name. If he is right in this view, he can fairly ask to be allowed to prove himself right. If he is wrong, he cannot too soon be disabused of any such notion. To attempt to stand between the President and the country would be the greatest mistake that the Republican party could well commit. If the feeling of the constituencies has really undergone the change indicated in the MARSHAL'S Message, it is as important for the Republicans to know it as for the Government. So long as they remain ignorant of the fact they are in constant danger of making the breach between themselves and the nation wider. If the change exists only in the MARSHAL'S fancy, it will be well that the Opposition should at once be armed with the strength which comes from a deliberate judgment of the electors in their favour.

Contradictory assertions are constantly made in Paris as to the precise nature of the issue which the MARSHAL means to submit to the country. According to one opinion, he will plainly tell the electors that, if they wish to have him any longer as President, they must support the Ministers of his choice. According to another opinion, the MARSHAL holds that he has undertaken to protect the nation against itself, and that until his term of office has run out he means to stick to his post, even if the nation plainly signifies that it does not want to see him there. Both hypotheses are put forward in journals which are supposed to receive inspiration from members of the Cabinet; and both probably represent views which have been urged on the MARSHAL by one or other of his advisers. It is probable that when he dismissed M. SIMON and took the Duke of BROGLIE into his councils his intentions pointed to the former alternative. Nothing was said about resignation in the Message read to the Chambers just before the prorogation, but some of the phrases contained in it would be scarcely intelligible unless resignation was in the MARSHAL'S mind. The kind of appeal which he there seems to contemplate could hardly have its full effect if resignation were altogether kept out of sight. Whatever hopes he or his Ministers may build on, the elections must have as their foundation the supposed unwillingness of Conservative France to be left without its protector. Experience has proved that, as between one Cabinet and another, French Conservatives can show themselves sublimely indifferent. If anything is to rouse them from their lethargy, it must be the conviction that it is only while Marshal MACMAHON remains in office that Ministries may come and go and no harm follow. It is at least possible—Marshal MACMAHON perhaps thinks that it is highly probable—that the prospect of a change of President may affect the electors in a quite different way from any in which they have been affected hitherto. The position in which the new Cabinet finds itself is not one which makes it safe to leave any chance unused. The course which the MARSHAL has taken is one that can only be justified by conspicuous success. He has dismissed a Minister who, however he may have obtained his majority, did undoubtedly possess one. He has replaced him by a Minister who, in the absence of external help, is as little likely to secure a majority as any politician in France. He has so completely broken with the Chamber of Deputies that a prorogation was the only means of giving the new Ministers time to settle into their places without encountering a tempest of hostile votes during the process. It is impossible to represent this policy as constitutional in spirit, whatever it may be in the letter. If it is not to receive a decisive condemnation at the hands of the electors, it must be because they feel that to condemn it would be to bring on themselves yet greater evils than any that can follow from submission.

All this may have been in the MARSHAL'S mind a fortnight ago, and yet he may now be hesitating whether to abandon the suggestions here indicated. If he determines to ask the country to say, not merely whether it will have M. DE BROGLIE for its Minister, but also whether it will have Marshal MACMAHON for its President, much will depend on the success which the Republicans secure.

offer. It was said at first that M. GAMBETTA intended, in the event of the MARSHAL threatening resignation, to support the candidature of M. GRÉVY. From a purely party point of view this would have been an excellent selection. M. GRÉVY is a man of irrefragable consistency and great self-control, and he has shown himself capable of commanding the unwilling respect even of those who, if they could, would gladly challenge the justice of his rulings. But he is a Republican of the Republicans, and it is doubtful whether France does not still prefer a Republican who has become one by necessity to a Republican who has all along been one from conviction. Nor is this preference, supposing it to be entertained, quite so irrational as it may seem. Republicanism by conviction is associated in the minds of Frenchmen with a doctrinaire dislike of compromise which would make it very difficult for a Government to deal fairly by all the contending parties over which the Republic has to make good its rule. Republicanism by necessity comes to them as an expression of that practical good sense which prefers the substance of government to the form, and is as ready to live under a Republic as under a Monarchy, provided that the same advantages are attainable under the one as under the other. It was announced a few days back that M. GAMBETTA will give the best possible evidence that he appreciates the nature of the situation by recommending the Republican party to take M. THIERS as their candidate. M. THIERS has never, perhaps, surrendered the desire of playing a return match with Marshal MACMAHON; and if it comes to be known that, when the MARSHAL resigns, M. THIERS is willing to take his place, it is impossible to predict what will be the effect of such a declaration on the country. When M. THIERS retired in 1873, his popularity was apparently unshaken. But he had no legal power of dissolving the Assembly, and he knew that his Commander-in-Chief had been gained over by the other side. If Marshal MACMAHON throws himself upon the country in such a way as will enable M. THIERS to do so likewise, the whole character of the contest may be revolutionized. M. THIERS has extraordinary claims on the gratitude of Frenchmen, and there is no danger that in recognizing these claims they will be led astray into any Radical excesses. M. THIERS's reputation for Conservatism is hardly less assuring than Marshal MACMAHON's own.

WOMEN AT THE UNIVERSITIES.

WHEN the House of Commons next takes up the Universities Bill, it will be called upon to discuss the clause which Mr. BALFOUR proposes to insert, empowering and virtually directing the Commissioners to provide for the admission of women to degrees. The idea of a woman donning the Oxford or Cambridge cap and gown over her ordinary dress and headgear, going up for her examination in the Schools or Senate House, taking part as a Mistress of Arts or a Doctress in the debates of the Academical Senate, sitting for a Fellowship, and perhaps making her appearance in the Common Room or Combination Room (for the appurtenant privileges will no doubt be claimed in time as well as the degree) is at least novel enough to excite the merriment with which it seems to have been received by some of the opponents of the clause. But we entirely agree with the Woman's Rights party, that this class of questions is not to be treated with levity. The earnest attempt which is being made by a considerable body of men, members of Parliament and others, in conjunction with a group of female enthusiasts, now by conferring political power on women, now by thrusting them into male professions and male places of education, to revolutionize the relations between the sexes, and to convert woman from the partner into the competitor of man, is one of the most serious subjects of the day. It is more serious than most of the questions which at present form the dividing line between the masses of the two political parties. Indeed it will probably soon be recognized as a dividing line itself. Liberals who are not Woman's Rightsers will before long be compelled to combine in some way for mutual defence against the attacks of an organization which is everywhere making furious efforts to eject them from their seats in Parliament, virtually under the auspices of Mr. STANSFELD and Mr. JACOB BEIGHT. The movement has recently sustained heavy reverses on the suffrage question not only in England, but in America, its native country, where an anticipated victory in Michigan

turned out a crushing defeat. But it is not likely that the discontent with the present position of the sex which has been so laboriously excited among women will subside without calling for further efforts on the part of those opposed to the threatened revolution.

If the object of Mr. BALFOUR's clause were the general improvement of female education, he might appeal to universal sympathy; though we hope it is not illiberal to hold that young women are capable of being overstrained by intellectual labour, and that, useful as an acquaintance with the mysteries of physiology may be in rearing children, the first qualification of a mother is to be healthy herself. But the general improvement of female education is not the object, nor is it likely to be the result; the average level of the instruction at female schools and colleges would be rather depressed than elevated by transferring the most aspiring and promising girls to male Universities. What is aimed at is the removal of the line of distinction which exists, and which has hitherto been supposed to have been traced by the hand of nature, between the woman's destination in life and that of the man. In its earlier stages education is general, in its final stage it is, or ought to be, a preparation for the calling in life; and to send men and women to the same Universities is to pronounce that their calling in life is the same. The higher degrees are professional; and the general tendency of University reform is to connect them again practically with the professions, as well as to divide the course in Arts into schools more or less ancillary to the Faculties. The Revolt of Women, as it has been styled by one of its American apostles, in imitation, we suppose, of the "Revolt of Islam," is not an insurrection against any grievance the renewal of which would be compatible with the maintenance of the existing relations of the sexes; it is an insurrection against the lot of woman. It has its source mainly in a hatred among the more ambitious of the sex of the domestic quiet and comparative seclusion to which the woman is consigned by her duties as a wife and mother, and in a desire to go forth and play with men in the mart and on the platform the more bustling and exciting game of life. Its effect in producing, where it strongly prevails, indifference, if not aversion, to maternity has been frequently noticed. The orators of the Woman's Rights movement are fond of ascribing all their own good qualities to their mothers, leaving us to infer that their fathers were not so satisfactory. The obvious conclusion would seem to be that mothers who have done their duty so admirably should be allowed to remain as they are. In endeavouring to improve them by the method now proposed we shall run some risk, to judge by Transatlantic experience, of improving them out of existence.

The success of "Co-education" in American Universities will probably be cited in support of Mr. BALFOUR's motion. But it may be doubted, not only whether the experiment has been successful in American Universities, but whether it has been tried. There are in the United States institutions without number, of more or less importance and promise, styling themselves Universities, and on which ultra-democratic Legislatures have showered with a lavish hand powers of conferring degrees in all the departments of human knowledge. But there are as yet only two which their European competitors would fully recognize as Universities, Harvard and Yale. To neither of these, we believe, have women been admitted. Harvard is in the very focus of New England Radicalism, which has been stimulated of late to the highest pitch by the struggle with Slavery; and Woman's Rights did not fail to knock fiercely at the gate of the University. Mr. ELLOR, the President, of whose visit to this country some years ago many of our men of letters and science retain a pleasant recollection, is himself an offspring of the new culture, having received a scientific rather than a classical training, and has distinguished himself in his University not only by a liberal policy, but by somewhat daring, though successful, innovation. It was therefore from no ungenerous narrowness or love of obsolete monopoly that he desired time before consenting to a change which he saw would profoundly alter the character of the institution, in order to make a tour of inspection through the institutions at which the system of Co-education prevailed. The result of his tour was a report, in the shape of a paper read before the Social Science Association at Boston, decidedly adverse to the system, and pointing to the conclusion that, so far from increasing in popularity, as its advocates asserted, it was on the wane, and that, where it did pre-

vail, it was either as a passing fancy or as the temporary expedient of a newly-settled country unable at first to provide the sexes with separate places of education. Mr. Eliot was of course accused by "Woman" of being actuated by objectionable motives, and was even identified by the lips of the excited fair with the incarnate Spirit of Evil. But his judgment, based on a careful examination of the facts, prevailed; and Harvard remains a male University, daily increasing in eminence and rising in general esteem.

It is true, and the friends of "Co-education" are entitled to the benefit of the fact, that adults of both sexes have, in the United States, been brought together in the same places of education, without engendering the scandals which were said to have attended a similar experiment at Zürich, and which seem to have confirmed the Universities of Germany in the determination not to admit women. The most notable instance of this is Oberlin, which boasts of its success in combining the two sexes, as well as in combining the black and white races. But, in the first place, there may be, and, if we are not misinformed, have sometimes been, bad results short of positive scandal; and, in the second place, there seems to be justice in the remark that the scale on which the experiment has been tried has been too small to warrant any important conclusion. Every sect, while it is new, is exemplary in its conduct, because it is militant, and the eyes of an adverse world are upon it. The decorous behaviour of a few young women selected as the pioneers of a movement by an exceptional ambition, which is sure to carry with it exceptionally industrious habits, and placed under the special restraints of a position still peculiar and equivocal, can afford us no assurance that the young men and women of our wealthier class generally might be safely thrown together during the years of their final education at a place where they would all be removed from the restraints of home. The union of boys and girls in the American common schools, whether its effects in other respects be good or bad, can of course support no inference as to the probable consequences of the system in its application to adults. Much has been said of the benefits to be reaped from the reciprocal influence of the two sexes on the character of both; but an English student is not a cloistered monk. To say nothing of the female society at Oxford or Cambridge, he is at home, and in general society, half the year. It has not yet been proposed, we believe, to introduce, for the purpose of moral culture, male students into female colleges, as well as female students into male colleges, though the advocates of the system will hardly have shown the courage of their opinions till they have applied it in both ways.

If the London University thinks fit to confer degrees on women, it can do so without requiring them to take up their residence in the midst of young men, and without disturbing any established discipline or arrangement. Oxford and Cambridge, as Universities which teach and require residence of their students, are in a very different position; to them the change would be a revolution. We are aware that this argument, instead of being dissuasive, will be an incentive to the thoroughgoing champions of Woman's Rights, who seem to take special pleasure in forcing an entrance for their sex wherever their presence happens to be, according to ordinary notions, peculiarly incongruous, and particularly inconvenient, no doubt because victory in such cases is the most signal assertion of the social non-existence of sex. But Parliament will probably refuse to create gratuitous confusion for the purpose of setting its seal to a controverted theory. Shadow of abstract right on the side of the claimants for admission there is none. In the case of schools, there may be ground for the complaint that in some cases endowments intended by the founder for both sexes, or from which girls are not expressly excluded, have by mere custom become limited to boys. But no one can doubt that the founders and benefactors of Oxford and Cambridge intended their endowments for male students alone, and that, if the funds are to be diverted to the purposes of female education, it must be on the ground of present expediency, which, we conceive, has not yet been shown to exist.

GENERAL GRANT.

DURING his visit to England General GRANT may enjoy the satisfaction of knowing that he has left his country in the enjoyment of perfect tranquillity.

Commercial depression still continues on both sides of the Atlantic; but the people of the United States are exempt from the political anxieties which disturb nearly all Europe. Even personal and party grievances against the new PRESIDENT will wait for expression till the reassembling of Congress; and it will probably then be found impossible to organize any active opposition. Only a few months have passed since foreigners unfamiliar with American modes of proceeding apprehended a violent collision of parties in consequence of the difficulties of the Presidential election. Those who understood the case better foresaw that some compromise would be arranged in time to avert serious inconvenience. The Republican candidate intimated his readiness, if he were elected, to grant the most urgent demands of the Democrats; and there can be no doubt that his rival would have been equally accommodating to his political opponents. The most irritating anomaly which had resulted from the Civil War has been finally abolished since the natural rulers of the Southern States have resumed their supremacy by the aid of the Republican PRESIDENT. The most urgent task which awaits the Government is the introduction of a competitive system of appointment to the Civil Service, if Congress can be induced to sanction a self-denying policy. It is not improbable that the party managers may be too strong for the PRESIDENT and his Cabinet; but the Legislature must either adopt the proposed reform or incur the responsibility of maintaining a notorious cause of political corruption. An able and resolute statesman might confer another great advantage on the country by accelerating the resumption of specie payments; but the present SECRETARY of the TREASURY has in former times held heterodox opinions on finance; and he may probably shrink from the unpopularity which always attends even the most necessary contraction of the circulating medium.

Since the expiration of his term of office General GRANT has recovered a portion of his former popularity, and, as the memory of his imperfect success in administration becomes fainter, his claims to national gratitude and respect will be more fully recognized. He is said to have acknowledged that on his first accession to the Presidency he was wholly ignorant of politics; and perhaps he would have been better qualified for his office if he had never learned the lessons by which his conduct was afterwards guided. His first attempt to form a capable and honest Cabinet was creditable to his honesty and good sense; but, as soon as he recognized his inability to maintain his independence, his submission to the political managers of the party was too abject and too complete. In his Messages to Congress his most original suggestions only betrayed his want of economical and political knowledge. He was incapable of understanding the fallacies of the protectionist theory; and he fancied that the acquisition of foreign territory was the best mode of extending commercial enterprise; yet on some points he made an effort to think for himself, and he succeeded in understanding the reasons for returning to specie payments. In his choice of agents and confidential advisers he was singularly unfortunate; for, although he was free from personal corruption, some of his nearest associates were exposed to general suspicion, and some to actual prosecution. His dealings with the Government and Legislature of Louisiana were arbitrary and unconstitutional; and, on the whole, the Republican party had little reason to congratulate themselves on their repeated choice. A successful soldier failed in administrative business for the same reasons which render a civilian incompetent to command an army. The most absurd charge which was advanced against the late PRESIDENT was that he meditated the perpetuation of his tenure of office by the use of military power.

One of his countrymen injudiciously claims for the late PRESIDENT the merit of having contributed to the establishment of comparatively friendly relations between the United States and England. General GRANT may perhaps be entitled to the gratitude of his countrymen for his share in procuring the Alabama arbitration; but no modern transaction suggests to Englishmen equally irritating recollections. It is unnecessary to discuss the reasons for offering a courteous reception to a famous soldier who has also held high civil office. Mr. HAYES has shown good taste in directing the diplomatic and naval officers of the United States to pay every honour to his predecessor. The rank which he has held would alone entitle General GRANT to attention and deference, if his

professional eminence were less conspicuous. Among ex-Presidents of the United States, only two or three have attempted to continue their political activity. Mr. QUINCY ADAMS had a seat in the House of Representatives, and Mr. ANDREW JOHNSON was for a short time again a member of the Senate. General GRANT will probably be content with having held for eight years the highest rank to which a citizen of the United States can aspire. He is not an orator, and there is no reason to suppose that he would in any capacity succeed as a politician; but in his own proper department he has few competitors for distinction. With the exception of three or four famous Germans, he has commanded larger armies than any other living general, and he was the most prominent among the soldiers who brought the civil war to a successful conclusion. Some Americans think that SHERMAN displayed higher military ability than GRANT; but the occupation of Richmond, and the subsequent surrender of LEE, were the most striking and decisive exploits of the war. General GRANT was the first of the Northern generals who stemmed the tide of Confederate success. His capture of Vicksburg had a great effect in determining the fate of the struggle in the West; and in his final campaign in Virginia he showed that he thoroughly understood the use which might be made of overwhelming numbers. It was asserted at the time, perhaps with little exaggeration, that General LEE in his gallant defence of Virginia inflicted on the Federal troops losses exceeding the number of his own entire army; but General GRANT, with inexhaustible reinforcements at his disposal, could not fail to secure the final victory. SHERMAN's march to the Eastern coast had been concerted with the Commander-in-Chief, and formed a part of the general operations.

General GRANT, when he received General LEE's surrender at Appomattox, anticipated in his courteous demeanour the wise generosity of his countrymen, which has in a few years almost obliterated the bitter recollections of a formidable struggle. There is no other instance in history of so liberal a policy as that which has been adopted since the victory of the North. The brave enemies who had, with characteristic freedom of speech, been denounced during the war as rebels and traitors, found as soon as peace was restored that they were safe, not only from vengeance, but from obloquy. No capital execution, except for private crimes, disfigured the Federal victory, and already, after a dozen years, the military merits of Confederate officers are recognized in all parts of the Union as justifiable causes of patriotic pride. The Vice-President of the Confederates has since sat in the American Senate; and a Confederate officer is, with the approval of a Republican President, Governor of South Carolina. The Commander-in-Chief of the victorious army may therefore look back on his achievements with unmixed satisfaction. His exploits in the field, as well as the high civil rank which rewarded his success, entitle him to respectful attention during his visit to Europe. It fortunately happens that in all countries great soldiers habitually rank with great nobles, and next after princes. No well-bred Englishman would fail in deference and courtesy to the former chief of a great nation; but General GRANT will perhaps be more flattered by the recognition of his personal distinction than even by the precedence to which he is entitled in virtue of his former office. Unlike great Continental soldiers, he will not be surprised in England by the absence of military display consisting in great masses of troops. His own country almost dispenses with a standing army in time of peace, although in case of emergency it commands the services of hundreds of thousands of men, and of accomplished generals to command them.

It may perhaps not be unreasonable to express on the present occasion a feeling of regret for an American who attained eminence in a widely different sphere. Mr. MOTLEY was a laborious and successful student of history; and he deserved and acquired in England a high social position. When nothing occurred to excite his susceptible patriotism, he was one of the most agreeable and instructive of companions, and his literary sympathies were both comprehensive and correct. The causes which interrupted his diplomatic career were not fully understood; for, although he had chosen England as the home of his later years, he was sensitively alive to anything which affected the interests or character of the United States.

TORPEDOES AND IRONCLADS.

THE instantaneous destruction by torpedoes of the Turkish monitor at Matchin brings startlingly into view a new phase of naval warfare. The ship which was blown up in this manner may not indeed have been one of the best of its class; but it appears to be admitted that even the strongest ironclads in existence, our own included, could not resist the effects of such an explosion. Of course it does not follow that this torpedo practice can always be as easily and as safely carried out as in this instance, when a handful of Russians, favoured by the night and a cloudy sky, and by the apparently careless watch of the Turkish crew, were enabled to approach the ship and to attach their deadly explosive unperceived. It was an exceptionally daring act, performed under peculiar circumstances, and the chief interest of the event lies in the intrepidity which was displayed by the man who plunged into the water and swam silently to the Turkish ship, and placed the torpedo in close contact with the bottom of the ship, but which might have been readily baffled under other circumstances. On the whole, it may be thought that good opportunities for feats of this kind are not likely to be very frequent, and that the men who are engaged in such attacks will have to carry their lives in their hands, and will have the balance of chances against them. This, however, is only one example of the use of torpedoes; and there can be no doubt that these weapons will, in one form or another, become henceforth a regular feature in naval warfare, and must therefore be taken into account. Although this blowing up of a monitor is the most striking illustration which has yet been given of the terrible powers concentrated in the torpedo, its capabilities in this way cannot be regarded as a novel discovery, though it has apparently been rather neglected by the authorities. Ground torpedoes of the primitive type have often been used for the defence of ports, as, for example, in the American Civil War; and some ten years ago the Admiralty was induced to establish a Torpedo School at Portsmouth. Until last year, however, this branch of naval education was treated only as a subordinate element in the course of gunnery instruction on board the *Excellent*, when it was made a separate and independent department. The *Vernon* is now assigned to this purpose, and a course of training has been established, including, not only the practical work of torpedo practice, but a knowledge of electricity and magnetism. In the Estimates of this year there are votes of 80,000*l.* for torpedoes and 4,000*l.* for experiments. It has also been decided to build a torpedo-ram of 2,000 tons, which is to have no guns, and simply to be, as it were, its own projectile acting by force of impact, with the help of torpedoes. It may be hoped, therefore, that the subject has at last been taken up in earnest. In a case of this kind it is of vital importance to the country that the navy should be full abreast of the latest results of scientific invention. It is not enough that we should be able to defend ourselves at home or to compete on close terms with foreign navies. We must turn our expenditure and mechanical ingenuity to account by, if possible, securing in every way the supremacy in naval power which, from our peculiar position and responsibility, is essential to the interests and safety of the nation.

Those who wish to know about the present state of the torpedo system cannot do better than turn to the recent speech of Captain CHARLES BERESFORD in the House of Commons, in which he gave a graphic account of the possibilities, as well as actual results, of the use of this weapon. In addition to the primitive type of the "HERRY" or "towing" torpedo, which explodes on striking, and the sunken "ground torpedo," which is exploded by contact or electricity, and may be considered as crude types, there are some more highly developed species, such as the "spar" torpedo, which is carried in a small boat, which is also exploded by touching or electricity; the THORNTON torpedo steamer, which is partly submerged and therefore scarcely discernible in its movements, and which, lately in a trial off the French coast, went at nineteen knots an hour, chased, and sunk an old vessel sent out before it; and the WHITEHEAD torpedo, which Lord CHARLES described as the most awful of infernal machines. The last is an automatic projectile, some six yards long, like a cigar, with pointed ends, and consists of three compartments—the head, containing a powerful charge of gun-cotton; the central part a balance chamber, adjustable

any depth of water down to 30 feet; and an air-chamber with a compressed air-engine. It is said to be able to go at the rate of twenty knots for a thousand yards, and may be set so as to explode either by contact or at any distance under a thousand yards. It could be fired above the water, and would sink to the depth it had been set for, and then go straight to the ship aimed at, no matter how fast the latter might be moving; and if by any chance it missed its object it could go to the bottom and explode on half-cock and rise to the surface by its buoyancy; and was calculated to make a hole of 70 feet area; in fact, as Lord CHARLES gave out, "It could do everything but speak." This may perhaps be thought rather an extravagant description of the torpedo in question; but it would seem to be in its way a very clever one, judging from the experiments which took place the other day before the PRINCE OF WALES. On the same occasion an automatic steam-pinnace, with nobody on board, and controlled by electricity, was sent out, and dropped and exploded a series of countermines "with surprising results." What the same speaker recommended was a number of very fast schooner-rigged steam-vessels, like steam-yachts, doing not less than 12 knots, and fitted with torpedoes; and also an organized system of training in connexion with our defensive coast torpedoes, so that seamen as well as engineers might know how to manage them. Any one can form an idea from these accounts of the style and performances of the torpedoes which are at present available for use in warfare; but there is another question which requires consideration, and that is, not whether torpedoes can efficiently perform the functions attributed to them, but whether they can be safely managed. It has, it is reported, been asserted by one experienced authority in regard to the WHITEHEAD torpedoes, that every ship of war carrying a supply of these missiles carries a terrible and novel source of danger to herself, and that the unskillful use of one of them might easily bring on the ship using it the destruction intended for the enemy. The electric torpedo worked quietly from a battery on shore is no doubt a safer thing, unless there is singular carelessness on the part of those in charge of it; but still there is, under almost any circumstances, a serious risk; and, as Captain FISHER has remarked, the great secret of the successful management of torpedoes will be found to consist in paying the utmost attention to apparently trifling precautions, and in trusting no one. How far the skill and disciplined experience required for such hazardous work have already been secured it is difficult to say; but on this point will no doubt turn the future of the torpedo system. Moreover, while the efficiency of torpedoes in attack appears to be somewhat doubtful, there is also a difficulty in providing for the protection of ships against this insidious foe. Wire nets round the hulls would embarrass the ships, while supplying only an imperfect guard; and the strengthening of their bottoms would increase their already excessive weight, so that the only resource would be in the free use of electric light and a careful watch.

Apart, however, from this aspect of the subject—that as to the value of torpedoes—there is another naval question to which Mr. BRASSEY has just directed attention in, on the whole, a very sensible and practical letter to the *Times*. He holds that it is a mistake to keep up so large a proportion of large ships, to the exclusion of vessels of moderate size and of more general usefulness; and that, as it is impossible to make the big ships invulnerable, and as they are nearly as liable to destruction as those of a smaller and less costly type, it ought to be a cardinal maxim to distribute the strength of the navy into as large a number of ships as may be, only taking care not to make any ship too small for being thoroughly efficient in its particular kind of work. At present a great deal of money is spent on huge, heavy ships, which are liable to be lost through torpedoes or bad engineering, and are by no means so generally useful as smaller, cheaper, and more easily handled vessels; and, as Mr. BRASSEY remarks, the result of the exaggerated dimensions of our ironclads is, not only to absorb funds which might be much more advantageously invested in other ways, but also to limit the number of ships and guns in the British navy. Mr. BARNABY, the head of the Construction Department of the Navy, has expressed the opinion that, under existing conditions, the ironclads require, as a protection against torpedoes, to be each attended and supported by a flotilla of gunboats; and Mr. BRASSEY and Sir BRADLEY ROBINSON are both disposed to take the same

view. Mr. BRASSEY calculates that a fleet of ten *Inflexibles*, covered with penetrable armour, such as they wear, would cost as large a sum as that for which the country might obtain thirty steam-rams of 2,000 tons, without guns, at 100,000*l.* apiece; sixty gunboats of the *Gamma* type, two of which have lately been built by the Elswick Factory, and have yielded good results, at 25,000*l.* each; and a serviceable and sufficient force of torpedo boats. Thus the balance would be very much on the side of the latter plan, by which the navy would be made more useful by an increase in the number of guns and vessels at command, and the expenditure would yield more valuable results. This is a view which most people, though they may reserve their judgment as to details, will probably regard as *prima facie* sound and practical; and it is to be hoped that it will receive serious consideration. It cannot be too strongly impressed on the Admiralty at the present moment that it is bound to keep up to the highest possible point, not merely the defensive, but the attacking, power of the country.

MR. BUTT AND THE IRISH OBSTRUCTIVES.

IT will be some satisfaction to those suffering members of the House of Commons whom a cruel fortune has kept moving in and out of the lobby during the small hours at the instance of Mr. BIGGAR and Mr. PARNELL, to learn, from a correspondence between these gentlemen and Mr. BUTT, that they are not alone in their misery. The endless series of motions that the debate on the House be adjourned with which the names of these dauntless patriots are associated have been as wormwood to their nominal leader. It is Mr. BUTT's misfortune to differ from Mr. BIGGAR and Mr. PARNELL upon the first principles of Home Rule strategy. What they think policy, he thinks a wilful throwing away of chances. All his carefully constructed schemes go for nothing in the presence of the rage and despair which their conduct excites in the minds of English members. These obstructive tactics have been indirectly played off even upon Mr. BUTT himself. He had once actually drafted certain amendments which aimed at redressing an Irish grievance under cover of redressing an English one; and he thinks that, but for Mr. BIGGAR and Mr. PARNELL, there would have been a fair chance of getting them passed. But the night on which the amendments were to be considered happened to be one of those on which Mr. BIGGAR was making himself formidable alike to the Government and the Opposition by his resistance to the progress of the Mutiny Bill, and the consequence was that the measure which Mr. BUTT had been so anxious to make use of never came on at all. Very probably it is now shelved for the Session, so that Mr. BUTT has the double pang of losing his amendments and being instrumental in causing his friend to lose his Bill. By a coincidence which will give a passing pleasure to some of those weary politicians for whom Mr. BIGGAR almost nightly murders sleep, this blow to Irish interests has been inflicted by the very weapon which has heretofore been so powerful in Irish hands. Had the discussion on the Mutiny Act closed at one o'clock on that eventful morning, Mr. MUNDELLA's Bill for the abolition of the qualification of a Town Councillor would have been considered, Mr. BUTT would have moved its extension to Ireland, and, in his own opinion, would probably have carried his motion. The time spent on the motion for reporting progress made this impossible, and the adjournment of Mr. MUNDELLA's Bill enabled its opponents to give notice of a motion for rejecting it. "It is now," says Mr. BUTT, "within the inexorable rule of half-past twelve; and it is very possible that, after watching through many a weary midnight, Mr. MUNDELLA may have the mortification of seeing his Bill for England lost for the Session because he wished to help us in establishing a popular principle for Ireland." This is not a way, as Mr. BUTT very truly says, in which Home Rulers can hope to conciliate the support of their English friends. In fact, the line taken by Mr. BIGGAR and Mr. PARNELL is rapidly bringing things to that pass that the Home Rulers will have no English friends left. It would be ungrateful in Mr. BUTT to hint a doubt whether, in such negotiations as have passed between him and English politicians, any other consideration than that of the inherent justice of the Irish cause found even a momentary place. But, sacred as the

principle of Home Rule may be, English members cannot be expected to defend it if they see that to do so makes the loss of their seats almost a certainty. Indeed, to a politician of Mr. Butt's practical mind, support given under those conditions would cease to be valuable. He does not expect to break up the Empire in this Parliament; and if the men who vote for him now will not have the chance of voting for him after a general election, he would as soon that they should vote against him.

It is fair to Mr. BUTT to say that he repudiates the tactics adopted by Mr. BIGGAR and Mr. PARNELL on higher and more general grounds than these. He objects to a policy of mere obstruction, because it risks the loss of one of the most valuable privileges which members of Parliament possess. If the power which a minority enjoys under the rules of the House of Commons of obstructing the progress of a measure by repeated motions of adjournment were invoked by every member at his pleasure, "no deliberative assembly could tolerate its existence. In self-defence any such assembly would be forced to 'abolish or curtail it.'" Mr. BUTT then points out that this power is really enjoyed at the pleasure of the majority, that it could be abolished or curtailed without any violent change in the rules of the House, and that, if a proposal to that effect were made in the present House, it would be very likely to be carried. If a privilege so justly dear to minorities were forfeited by the action of Irishmen, they would be exposed to the taunt of being unfit to administer even the forms of representative government. Mr. BUTT would like, however, to see his mutinous twins abandon the position they have lately taken up, from a better impulse than any which mere prudence can supply. It is the duty of Home Rulers to maintain before the civilized world the dignity of the Irish nation and the Irish cause, and that duty is closely bound up with the duty which they owe to the assembly of which they are members—"an assembly to degrade which is to strike a blow at representative institutions 'all over the world.'"

Whether Mr. BUTT's remonstrances will have any effect in Ireland must be left to the next general election to determine. It must be supposed that Mr. BIGGAR and Mr. PARNELL have not chosen their course without some degree of care and deliberation, and that, rightly or wrongly, they have satisfied themselves that it is one at which their constituents are not disposed to take offence. But if it proves to be generally unpopular in Ireland, the opinion of the farmers of Meath and Cavan will probably undergo an insensible change, and when the present members for those counties offer themselves for re-election, they will find that they have reckoned without their constituents. As yet the only expression of Irish feeling on the subject is contained in a placard calling on the Irishmen of Glasgow to attend a meeting for the purpose of cheering on the two new leaders who, "while gallantly fighting the enemy in the front," have been "attacked in the rear by Whig Home Rulers and weak 'or very genteel' patriots whose admiration for that superstition called the tone of the House, and desire to make a 'Parliamentary reputation,' direct their action more than a haughty spirit of defiance to England's 'usurped rule.'" Before this meeting Mr. PARNELL and Mr. BIGGAR appeared on Monday, and rendered an account of their stewardship which appears to have given abundant satisfaction to themselves and their hearers. Indeed, if Home Rule is to be obtained by either of the alternative policies now in the field, Mr. PARNELL's and Mr. BIGGAR's reading of the future appears more likely to succeed than Mr. BUTT's. The idea of "con-ciliating" the English people into breaking up the United Kingdom is certainly not so plausible as the idea of wearying them into it. Mr. BUTT appears to hope that, when Irish members have shown how pleasant they can make themselves, and when the Imperial Parliament has shown, by passing several of Mr. BUTT's Bills, how ready it is to legislate for Ireland according to Irish ideas, there will be no difficulty in bringing about a separation which shall send Irish members and Irish measures back to Dublin. Mr. BIGGAR trusts rather to his conscious ability to make himself a nuisance. He is resolved to show the House of Commons that, instead of being able to legislate for Ireland as well as for England, it is not even able to legislate for England, except on condition of granting Home Rule. These joint leaders of the Irish race in its new enterprise are genuine haters. They are quite ready to degrade representative institutions all over the

world provided they can strike a blow at the House of Commons. What if they do make it alter its rules and deprive minorities of the right of delaying the progress of a measure by repeated motions of adjournment? It is an English institution, and if it becomes less free or less efficient, it is England that will suffer. Ireland, it is true, will be silenced; but she can only gain by the additional proof which this fact will supply that she will never get justice from an English Parliament. If Mr. BIGGAR and Mr. PARNELL only persevere long enough, they may yet boast that they have destroyed one at least of the securities for free debate of which they found the House of Commons in possession.

THE CHURCH OF THE EIGHTEENTH CENTURY AND THE POOR.

NO one can see the notices of sermons and the like addresses which frequently placard the walls of our towns and the doors of theatres and other public buildings, and observe the care with which all ideas of sacredness and awe are excluded and made to give place to the vulgar curiosity, without speculating on what can have been the train of events which has led up to such perpetrations in the cause of religion. For these exhibitions are a comparative novelty. The vulgar have always been ready to show their contempt for religion, or for certain unpopular forms of it, by outrages upon reverence; but they have not always been drawn towards religion by such methods. Some change of feeling must have taken place to make the familiar tone congenial; and this change we take to be a revolt against the idea of authority, an idea that was once not above the comprehension and sympathy even of the most ignorant. This deference to authority might show itself in a fashion to excite the sense of humour or the sneers of keener and more cultivated intelligences; but it was a real influence and a beneficial one. Our old ecclesiastical biographies speak of the relish which an unlettered congregation had for the sound of Latin in a sermon. They did not mind their pastor being unintelligible now and then in a foreign tongue, being perhaps sufficiently used to finding him talk over their heads in their own. When the learned Dr. Pocock gave his rustic audience a plain sermon, they disparaged him as a plain, honest man, but "no Latiner." Addison, remarking on the same predilection for learning, tells in his inimitable way of rival preachers in a country town, one of whom, by quoting the Fathers in the original, emptied the church of the other, until he, finding his congregation mouldering away every Sunday, resolved to give the parish a little Latin in his turn, and digested into his sermons the whole book of *Quæ Genus*, adding such explications as he thought would be for the benefit of his people. This expedient in a very little time thickened his audience and refilled his church. No doubt these duped country folks cut a ridiculous figure; yet is there not a light in which their love of learning for its own sake, apart from their immediate edification, has its creditable side? With them surely such ideas as those of authority, antiquity, theology, orthodoxy, mystery, church order, ministers set apart, existed in their minds in some faint shadow and dim outline. The mere recognition of the value of learning in things divine, of the existence of truths and a history which it needed a special training to enter into and time to master, put them intellectually in a higher position than that where religion is viewed as equally without a past history and present mystery; which is evidently the mental state of the contrivers of the announcements of which we have spoken, and of the people who are attracted by them.

Ignorance which acknowledges the need of a teacher may be favourably compared with ignorance which does not perceive that it has anything to learn, and which chooses its guides by the rule of equality in standing and literary acquirement, recognizing superiority only in a more varied and sensational experience in evil-doing. When A. rests his claim to be listened to on his having been till lately a navvy, and B. asks a hearing in the capacity of retired pugilist; when C. puts forth his title to orders as the reformed drunkard, and D. as the converted pickpocket, they rely upon a degradation of the religious instinct which we think is a peculiar feature of this age, and which certainly was foreign to the popular religious feeling of the last century, as we gather it from contemporary literature; and we ask how it has come to pass that, with all our boasted education, the multitudes of our towns and cities have sunk below the perceptions of their ignorant forefathers on a point so material? In attempting an answer to this question we cannot but think that, in the interval between the examples we have quoted of a rustic reverence for learning and authority and the period which feels the attraction of the unauthorized and coarsely familiar, there have been causes on the face of things which may serve to account for the change. The poor and ignorant of those times did not receive that consideration from their superiors, whether lay or clerical, which a more sympathetic benevolence would have won for them; their reverence for what was above them, whether in station or bearing, was presumed upon, their submission relied on as a thing of course. What we now miss was then regarded as an inalienable characteristic, which needed no fostering, and therefore was little regarded. The relation of the poor to the Church was estimated as an

relation of contented subserviency, for which there was a *quid pro quo* in patronage, alms, and other favours. No susceptibilities were suspected or provided against; and certainly early in the century that cry against "enthusiasm" which later on was set up against the poor—and which caused the old women in the aisle who rustled the leaves of their Bibles in search of the text to be called beldames—was first roused by another class altogether, the comfortable and well-to-do. Dissent never begins with the poor; neither do revivals of any sort. They were not supposed to have ideas of their own. The poor, says the *Spectator*, which are the bulk of the nation, work only that they may live; and if with two days' labour they can get a wretched subsistence, they will hardly be brought to work the other four. No religious party was supposed to be anxious to win such adherents. Again, the *Spectator* quotes with approval a sleek and what is termed a "handsome paragraph" from a sermon of Dr. Snape on St. Bride's Charity Schools, which shows a complacent security that was little sanctioned by the event in the moral effects of a certain sort of teaching upon the indigent. "The wise Providence," says this divine, "has amply compensated the disadvantages of the poor and indigent wanting many of the conveniences of this life by a more abundant provision for their happiness in the next. Had they been higher born or more richly endowed they would have wanted this manner of education. . . . The learning which is *given* is generally more edifying to them than that which is *sold* to others; thus do they become more exalted in goodness by being depressed in fortune, and their poverty is in reality their preferment." A course of such sermons as this would go far towards accounting for the rise of dissent. But it was only paving the way.

Addison's tone is less unpleasant, but equally patronizing, and equally confident in the teachable spirit induced by poverty and humble circumstances. His notions of the religion of the rustic are entirely remote from independent thought or from any possibility of the poor taking a line of their own. The churchyard has almost as humanizing an efficacy as the church itself in his picture of the country Sunday. "It is certain," he says, "that the country people would soon degenerate into a kind of savages or barbarians were there not such frequent returns of a stated time in which the whole village meet together with their best faces, and in their cleanliest habits, to converse with one another on indifferent subjects, hear their duties explained to them, and join together in adoration of the Supreme Being." Not only does Sunday refresh in their minds the notion of religion, but it puts the sexes upon appearing in their most agreeable form. "A country fellow distinguishes himself as much in the churchyard as a citizen does upon the Change." Sir Roger could keep his eye upon a congregation of this class. He could call John Matthews to order, who was licking his heels for his diversion, and send his servant to wake any one who was nodding; but not for them did he compile that body of divinity composed of all the good sermons in the English language, which is recorded as his inaugural gift to his chaplain, in order that, instead of wasting his spirits in original composition, he might devote all his pains to elocution and a good delivery. The taste for learning, which Addison elsewhere touches on with such happy humour, he seems to have relied upon as making the elaborate periods of defunct divines not the less acceptable for being unintelligible. The difference between the seventeenth and the eighteenth centuries on this point seems to have been that the "Latiner" of the earlier age gave the people a sense of their value by holding them worthy of a display of his own best learning, thus quickening their attention and keeping it on the stretch; while the mistake of Addison's day was in separating and distinguishing between high and low, so that the duty of the poor was to go to church and behave themselves there, leaving it to their betters to understand. Once let a congregation of rustics suspect this broad distinction, and a tie was loosened that bound them to their pastor and their church. "Church work," says Sir Roger, "is slow work." So it is, slow in doing, slow in being undone; but slower still in repairing and restoring when the mischief has been done.

It is notable in our earlier essayists that, keeping pace with their growing lamentations over the spread and increase of schism, is their horror of enthusiasm. As all dissent was enthusiasm, the more dissent there was the more it behoved the Church to keep on her guard against enthusiasm. "There is not a more melancholy object than a man who has his head turned by religious enthusiasm." "Devotion when it does not lie under the check of reason is very apt to degenerate into enthusiasm." "The two great errors into which a mistaken devotion may betray us are enthusiasm and superstition"; and so on. This being the case, and any approach to the dreaded stimulus being above all things to be avoided, and yet some remedy being called for, a general agreement was arrived at, to the effect that a corrected style of reading the service, and action, graceful if possible, but action of some sort in the pulpit, furnished the true panacea. "If only our clergyman would be careful to recommend truth and virtue by the graces of elocution, it is not possible that nonsense should have so many hearers as you find it has in dissenting congregations," says one. "I do not doubt," writes another in the *Tatler*, "but if our preachers would learn to speak, and our readers to read, within six months' time we should not have a dissenter within a mile of a church in Great Britain." Thanks to the neglect of such accomplishments, schism made its way, and while the parson of the parish had to go to law for half his dues, the finest "Daniel" grew fat by voluntary subscriptions—

scriptions—"Bawling out my beloved, and the words grace, regeneration, sanctification, the day! or rather the night, is coming and judgment will come while we least think of it." It does not strike the modern reader that these words are out of place in a sermon, or unsuited for a rousing delivery. However, they are placed in strong contrast with preaching as it should be. The power of an impressive reading of the service is dwelt upon with an emphasis of conviction which scarcely finds a response in modern taste, to say nothing of experience. "Until Sunday was sevennight," we read in the *Spectator*, "I never discovered to so great a degree the excellency of the Common Prayer. When, being in St. James's Garlick Hill Church, I heard the service read so distinctly, so emphatically, so fervently, that it was next to an impossibility to be unattentive. My eyes and my thoughts could not wander as usual, but were confined to my prayers. . . . The Confession was read with such a resigned humility, the Absolution with such a comfortable authority, the Thanksgiving with such a religious joy, as made me feel those affections of the mind in a manner I never did before." And the writer goes on to propose that "the gifted reader shall, on the next assembly of clergy at St. John's College, read prayers before them; that those who are afraid of opening their mouths, those who holl, and read with a rakish negligent air, those Pindaric readers that are confined to no set measure, and those who read with an indifference as if they did not understand the language, may all be informed of the art of reading movingly, fervently, how to place the emphasis and give the proper accent of each word, and how to vary the voice according to the nature of the sentence." We own to no desire to see this ultra-studied reading in the ascendant again. Whatever it might have done in preventing the birth of schisms, we can hardly suppose it to be a potent instrument of reunion in our own day.

The whole tone of the period we find very well given in one of the *Tatler's* gravest satires (November 30, 1710), which brings before the reader the Church of England in visible presentment, invested with all her most distinguishing and valued characteristics, as she figures in a "show at that time carried up and down Germany, which represents all the religions of Great Britain in waxwork." "The middle figure was formed like a matron dressed in the habit of an elderly woman of quality in Queen Elizabeth's days. The most remarkable parts of her dress were the beaver with the steeple crown; the scarf, that was darker than sable, and the lawn apron whiter than ermine. Her gown was of the richest black velvet, and just upon her heart she wore several large diamonds of an inestimable value disposed in the form of a cross. She bore an inexpressible cheerfulness and dignity in her aspect, and, though she seemed in years, appeared with so much spirit and vivacity as gave her at the same time an air of old age and immortality." When the poet would describe the Church, she is immortal and unchanged; this elderly immortality, this look of being in years, is more to the liking of these eulogists, and the Elizabethan costume much more in the spirit of the portrait than a garb losing its origin in antiquity. And certainly this elderly woman of quality stands not as the Church for high and low, not as the Church for all classes and tempers, but for the docile, the comfortable, the respectable and thriving, the well-to-do; while her watchword "Moderation" puts her in complete sympathy with the temper which indeed likes enthusiasm nowhere, but can tolerate it anywhere except in religion. Our space comes to an end before our subject; the war with so-called enthusiasm was a long one, and was carried on with gathering bitterness.

A PHONETIC FIELD-DAY.

OUR Phonetic friends have been holding what it is now fashionable to call a Conference. In reading the report of the meeting of the would-be reformers of spelling, one is constantly reminded of that Lay in which Macaulay describes the gathering of the forces of Lars Porssenna. A proud man was Mr. E. Jones, B.A. (of Liverpool), upon the trying day. Mr. Tito Pagliardini was ranged beneath his eye, and Mr. Baxter Langley and many a proud ally. Among the conveners were "Mr. J. M. D. Meiklejohn, Professor of History and Art of Education, University St. Andrews, on the ground that there is a *prima facie* case for inquiry." Also, *some phrase*, Mr. Edwin Chadwick, who knows about drains, and Mr. Condy, M.A., appear among the philologists. Exoter added, in the person of Mr. Clapp, a representative of her School Board, and indeed there is no doubt that School Boards are sincerely interested in anything that can facilitate education.

Whether the phonetic reform of spelling is the best way of making matters easier remains to be seen. Mr. Max Müller had asked, in an article republished in an unknown tongue "by the benevolence of Mr. John Colman of Newcastle-on-Tyne," whether there was "no statesman in England sufficiently proof against ridicule to call the attention of Parliament to what is a growing national misfortune." Mr. Lowe has written to say that he is that man, that statesman. He has been informed that "there are thirty-nine sounds in the English language. There are twenty-four letters. I think that each letter should represent one sound, that fifteen new letters should be added, so that there should be a letter for every sound, and that every one should write as he speaks." At present Mr. Lowe finds that boys "from the sixth standard" are "unable to read aloud tolerably, and have no idea of the pronunciation of the language." The

haps a more funny set of arguments was never put together. For example, a boy from the sixth standard very likely expresses himself naturally thus:—"Ere's a statesman as isn't afear'd of reticule, 'e isn't." Of course when that lad comes to read Mr. Lowe's note in the newspapers aloud he blunders over it. And the remedy is to be the introduction of fifteen new letters, which will perhaps express the clicks, grunts, and nasal accents of the rustic, while the worthy lad meanwhile is "to write as he pronounces." A learned Frenchman has been contributing to the *Temps* a series of articles on the fine art of reading aloud; but he is not so revolutionary as to propose to introduce "zey zeying" into literary language. Meanwhile Mr. Isaac Pitman was immensely gratified by Mr. Lowe's letter. Mr. Pitman really seems to be a person who is easily pleased. He says that there are thirty-eight sounds in English and twenty-six letters, whereas Mr. Lowe gives a different calculation. Then Mr. Pitman went on to talk about "the 102 letters and combinations, representing 269 sounds"; and this they call facilitating education. By way of showing how phonetically-minded people agree among themselves, a letter was read from the Bishop of Exeter. The Bishop did not, of course, go so far as a statesman who is proof against ridicule; "he said it was essential to have no new letters, and only a few critical marks." We are not certain that the Bishop has got rid of a lingering fondness for the look of accentuated Greek.

Mr. Lowe was not present at the meeting, or he might have refuted Mr. Storr. That gentleman "hoped the Conference would give no encouragement to the suggestion that any changes of accepted pronunciations were involved in the reform advocated." Now Mr. Lowe, unless we misunderstand him, would let pronunciation be a free fight, every man writing as he pronounces. Thus, for example, a dandy would write that "Mistaw Lowe is a statesman insensible to widicule." But Mr. Storr does not at all see the good of this kind of change. In fact, the free-fight stage of spelling is over, and the forms which best adapted themselves to their environment have survived. Certainly these forms often do not seem the fittest; we grant that; but we hold that to provoke an insurrection among boys "of the sixth standard," to stir up a wordy war, and to fall back on the diplomacy of a Royal Commission, is not a scientific way of dealing with language. But if Mr. Whitney and Mr. Max Müller agree—*συνάμωμον γὰρ ὄντες ἐχθροὶ τὸ πρῶτον*—that spelling is a matter of legislation, why, the sooner Mr. Lowe moves a few resolutions on the business the better. He may divide the Liberal party a little more; but that has ceased to be a very important consideration.

We do not observe in the printed report of this Conference that the chairman, Professor Sayce, said very much, or committed himself to the accents of Dr. Temple, the new letters of Mr. Lowe, or the combinations of Mr. Pitman, whose alphabet seems admirably calculated to express the ravings of the inspired speakers at a Shakers' meeting. Mr. Sayce's opinion must necessarily be received with the deference due to his learning, when he talks about philology. He declared that English spelling "cultivated an unphilological habit of mind. The philologist wanted to trace the changes in sound from generation to generation. Spelling like ours concealed them." Now, of two evils, we prefer that philologists should be thrown out now and then with the sound of *ea* in tea in Queen Anne's time, rather than that we should undergo an irruption of pedantry, and of alphabets named "Jones-Burns," "digraphic," "Pitman," and "mixed," at the present moment. Mr. Max Müller says that "language is not made only for scholars and etymologists"; and we may add that all the disorder of arbitrary spelling cannot be introduced to please philologists. At one time French ladies and gentlemen sounded words in a very affected way, which one may see imitated in old comedies and satires. Does Mr. Sayce think that the courtly scholars of the period should have written as they pronounced? Or is it necessary that, because the editor of the *Tohernore Trumpet* may sound *sch* like *f*, therefore he should print in his leaders "fat is the matter wid her Machesty's meenisters"? Where, in fact, does Mr. Sayce draw the line? All varieties of sound in words are interesting to the philologist; but what a hideous chaos English literature would be by this time if spelling had not hidden the differences! In fact, just as speech is granted us to conceal our thoughts, spelling is useful to cover the infinite and infinitesimal varieties of sound which in spoken language may be given to each word. Philologists may, as a rule, learn what they want from rhymes, just as we know from Latin verse what the quantity of each foot was.

Great Anna, whom three realms obey,
Duth sometimes counsel take, and sometimes tea,

is the kind of hint that rhyme gives in abundance, and let that suffice for philologists. We will venture on an *argumentum ad hominem* with the Professor of Comparative Philology. How does he like Mr. Macarthur's scheme? Mr. Macarthur, as a teacher near Glasgow, has a peculiar right to be heard about the pronunciation of English. The Glesky pronunciation is jest ridiculous, to put it phonetically. And he writes a poem of Lord Byron's thus:—

The Destruction of the Acirian.
The Acirian came down like a wolf on the fold,
And his cohorts wer gleaming in purple and gold.

How does Mr. Sayce like it? What would M. Oppert think of the Acirian, or would he prefer the alternative generously given by

Mr. Macarthur, and read "Acirian"? Really at the bare notion of such reforms one turns—still to quote Mr. Macarthur—

As cold as the spray of the roc-beeing surf.

Perhaps Mr. Macarthur would spell the name of a famous ancient city "Karache"; or would he go the other way about, and dignify a painful but unromantic malady with the primeval name of Ezech?

One would imagine that the absurd caprice and whimsicality of all these systems and schemes would strike even their authors, and that a Conference would break up in laughter. What sort of ear has the man who wants to spell "goods" *guadz*? How can any one hope to know how Mr. Fry, Mr. Macarthur, and the rest pronounce when they are at home? Only people who live with them would be able to understand their letters and their printed works. The reformers are only united in dislike of established custom and usage. As soon as any serious attempt was made to please them, they would split off into a hundred sections, like other schematics. The vestment would be rent into as many fragments as the ancient Covenant, and Mr. Pitman would be found maintaining that he and a pupil, like Davie Deans and his friend, composed the true church of spelling. A little band would go with Mr. Macarthur into the wilderness near Glasgow. Only too many Scotch persons would form a congregation in the neighbourhood of Aberdeen, to help Mr. Alexander Bain to maintain the position of the late Dr. Clarke of Marischal College, that "lif is a dröm." "Shürli, sed I, män is but a shüdo, and lif a dröm." How could the convivial view of existence be better stated in Scotch? Only in the border counties the phonetic speller would have to write that "Lifo is a drawn," for that is how they pronounce it in the Peebles district. While these secessions took place, scholars who have, rather hastily we think, lent their names to this movement, would return to quiet collegiate cloisters, and add to the knowledge and wisdom of the world.

Phonetic spelling is merely one of the many fantastic shapes of modern individualism. It is like spirit-rapping, like conscientious objections to vaccination, like the morbid desire to marry one's deceased wife's sister, like Miss Cobbo's patent religion. To most of those crazes one or two distinguished men have given a kind of support. Is it necessary to say that the phonetic people have "drawn" Mr. Gladstone? They quote this text from the ex-Premier:—"The difficulties of spelling are enough to drive the learner mad." Surely that is stated rather too strongly, unless all educated people are either mad, or gifted with a power of mental resistance to maddening influences which we had thought unusual.

The reformers have one argument on their side to which we would willingly accord the most respectful attention. They complain—especially the politicians among them complain—of the difficulty of teaching children to read. This is not a matter over which we are inclined to make merry, though it may be thought perhaps that the difficulty is somewhat exaggerated. But some of the reformers seem to have a remedy which is at least less objectionable than the arbitrary revolution of written and printed English. Mr. Curwen said at the Conference—and we have heard the statement before—that, if children were taught phonetically in the lower "standards," they "could afterwards be taught the arbitrary (that is the usual) spelling." Thus, children, *ex hypothesi*, would learn easily and quickly, first on a system, next in the wonted way, and no ridiculous anarchy would be brought into our books and letters. But even that does not satisfy the reformers who issue the programme of the Conference. "Difficulties and objections would disappear if the new spelling could be taught to children for reading and writing; if children could pass easily from reading the new to reading the old spelling, and if the new spelling could be easily read by adults. Children would not be required to write in the old spelling, and adults would not be expected to write in the new spelling." How excessively condescending on the part of the children! They would not turn Mr. Lowe out of office, if he were in, because he had not mastered the fifteen new letters. They would not try the brain of Mr. Gladstone, which has already, it seems, suffered such a strain from the old spelling, by making him *take up* the new. Old spellers would be a kind of Jotuns, an expiring alien race, retired to lonely corners of the hills, to read Wordsworth in the old spelling. Where is the end of this nonsense to be? or are we all to lisp like babies of two years old, to write in words of one syllable, and adopt, not merely the spelling, but the grammar of young costermongers and ploughboys? These measures would save ploughboys and costermongers a world of trouble; but we think that, when all was done, philologists would still be far from happy.

CHANGES IN THE INDIAN CIVIL SERVICE.

THERE are certain tracts of country in India which possess the almost miraculous faculty of supplying the Law Courts with an unfailing crop of suits. A vast alluvial plain is watered by a river which, though of reasonable dimensions for six months in the year, becomes, when swollen by the melting snows of the Himalayas and by the periodical rains, perfectly unmanageable. The most skilful of engineers is baffled in any attempt to control or even to forestall its freaks. The process of erosion, diluvion, and accretion goes on at a rate and on a scale of which Englishmen cannot form the smallest

notion. In the space of a month, a week, or a few days, between June and September, a mile or two of some native gentleman's estate is submerged, slips away, and is thought to have joined itself to the patrimony of some other magnate two or three reaches down the river. When the rains subside, the face of nature is revolutionized. The main channel of the stream, which in the preceding year was known to flow to the east close under the village of Raja Haut, is now discovered to be running past the mart of Nawabgunje, two thousand yards away to the west. What in 1870 was a navigable channel, crowded with boats of all shapes and sizes, is in 1871 a solid island; and what were islands accurately delineated in the last map of the Survey are now winding channels or deep pools. Sometimes the change has been so violent and abrupt that a bewildered owner, at the cost of an expensive suit, can follow and identify his village and lands, which, an unmistakable channel has divided from the parent estate. Sometimes the process of accretion has been so imperceptible that no amount of local examination or hard swearing will enable a riparian proprietor to reclaim his own. But what is certain is that each transformation furnishes litigious landlords with a dozen fresh causes of action. And so, when two or three affrays have half filled the gaols, when the machinery of the civil courts has subsequently been put in motion, and when an appeal to the Privy Council has resulted in an admirable settlement of the question, with scientific demarcation of boundaries, another rainy season of unprecedented duration introduces new elements of confusion, and again reduces order to primeval chaos. Villages are once more obliterated; lands vanish; landmarks are swept away; the decree gained at a vast expense by Maharani Surnomayi versus Ram Chandra Bahadur is not worth ten rupees; and the whole drama of aggression, retaliation, tutored witnesses, documents made to order, eloquent speeches and exhaustive judgments, commences afresh. A discussion on certain Indian subjects has a strong likeness to a recurring cause of action arising out of diluvion on this gigantic scale. Something has to be done in order to remedy a patent inconvenience and injustice, or to treat unforeseen claims with equity. The best heads and the most brilliant pens are set to work, and a big Blue-book is published, in which a despatch from the Secretary of State winds up the protracted controversy, and lays down rules which ought to require no tinkering for at least ten years. Very soon, however, it seems that some contingency has not been anticipated. A deputation then endeavours to do for the last code of rules what a deluge of rain has done for the last decision of the Privy Council. About this time last year we endeavoured to show that, after a vast deal of correspondence, it had been advisedly determined to reduce the age at which candidates might be admitted to compete for the Civil Service of India. Though a wide diversity of opinion then prevailed amongst high officials, the Secretary of State decided on reducing the limit of age to nineteen from twenty-one. It might have been thought that, after an exhaustive controversy, the scheme should be given a fair trial. But in these cases there is always some apprehension which is born a little after its proper time, or some class which the new conditions place at an apparent disadvantage.

We have lately read a clever pamphlet by a Competition-Wallah, who does not sign his name, addressed to a Professor, apparently of some Scotch University, in which the writer contends that Scotchmen and Irishmen will, by the new rules, be prevented from finishing their secondary education at their own Universities. Though the writer sets forth his grievances with considerable ingenuity, his arguments are wholly one-sided; and, indeed, his case is made out entirely to his own satisfaction by quoting only the eminent officials who were for maintaining or extending the limit of age, and by omitting altogether those of at least equal ability, in reliance on whom Lord Salisbury had reduced it. It is sufficient for us to say, on this part of the question, that the new system deserves to have, and must have, a fair trial; and that the reasons for its adoption may be found in the Blue-book published last Session, set out in a correspondence which can be read without ennui, and even with pleasure. But the field is so wide, its importance so paramount, its new features are so peculiar, and its results so intimately connected with the good government of our Indian Empire, that we may fairly devote some space to the examination of other points connected with the discussion, and affecting the present state of the Indian Civil Service.

It does not seem to have occurred to the members of the late deputation or to the writer of the pamphlet that, while they are disputing over the question of a year or two more or less spent in study in England, or about the merits of Major Dalgetty's favourite college, as weighed against Oxford and Cambridge, new changes are threatened in India which in some degree affect the status, career, and expectations of the race of competitors. The question of the advancement of natives to higher and more responsible positions has engaged the attention of every Viceroy or Governor-General since the days of Lord William Bentinck; and at a recent convocation of the University of Calcutta, Lord Lytton, speaking as Chancellor, took the opportunity of making a public announcement that pledges given to the native community regarding their employment in posts of honour and profit had been openly given, and had not been redeemed. How they were to be redeemed, or how exactly these redemptions would affect equally clear and definite pledges held out to the Covenanted Service, Lord Lytton did not explain; and we admit that he appeared to guard vested rights, while there will probably be no want of stout

defenders and eager allies in case any vital blow is aimed at the privileges and dues of Anglo-Indians. We cannot, however, but regard the speech of Lord Lytton as unfortunate. The Viceroy, as Chancellor of the University, has not usually spoken at these meetings at all, but has delegated the delivery of a set annual address to the Vice-Chancellor, who, with a Council, manages the affairs of the University. It must be remembered further, that an address delivered in the Town Hall of Calcutta is practically an address only to the young and intelligent youths of Lower Bengal. In no sense is it a manifesto to the Empire at large, or to the far more manly and vigorous tribes of Western and Upper India. If the Viceroy has made up his mind to reconstitute the Civil Service, to deprive, prospectively, Anglo-Indians of any of their prizes, or even to admit natives from outside to the enjoyment of several of the ordinary district offices hitherto reserved exclusively for the Civil Service, the proper place for any such manifesto would be a speech delivered in the Council Chamber or a careful Resolution issued from the Government of India in the Home Department. But for a Viceroy to take into his confidence the acute Bengali Baboo, who has no want of self-assertion, vanity, or conceit, is nearly as much a political error as if the Prime Minister were to appear as Rector before the University of Glasgow, and to discuss with the professors and students the details of the late Conference at Constantinople, or the intentions of the Cabinet regarding the Suez Canal. It is quite right for the Indian Government, as part of a long-sighted and equitable policy, to educate intelligent natives, to multiply district schools and provincial colleges, to hold out fair prospects to bachelors in arts, science, and law, at Universities modelled on the form of the University of London, and to give to possessors of high degrees opportunities of proving that they can rise superior to the temptations of their age and country, and take part creditably in the administration of public affairs. Nor need we ever apprehend any deficiency in the class of doctrinaires to whom ability to quote Milton and write an English essay on "Government by Aliens" is a guarantee of fitness for every kind of employment in which untutored tact, unexamined judgment, and uncramped knowledge of men are absolutely indispensable.

As some misapprehension may arise amongst candidates and crammers regarding the exact nature of the changes now impending, we take this opportunity of explaining them, having reason to believe that our version will not be found at all wide of the mark. All high Indian authorities are agreed on the policy of employing natives, gradually, in executive and judicial duties, as far as they can be trusted to perform them without detriment to the public service. It has even been suggested that examinations should be held at Calcutta, Madras, or Bombay, to admit natives *pari passu* with Englishmen into the ranks of the Civil Service, and so to avoid all difficulties about crossing the dark ocean and losing caste. But the best friends of the natives have long ago come to the conclusion that, to a young and ambitious Hindu, the trip to England is an indispensable part of education. A knowledge gained of the results of our civilization in a residence of two years is worth far more than the intelligent crammer or the fierce competitor. Caste has ceased to be a bugbear; at least with Hindus who are beginning to think of Sutee as a mere myth, and to talk of the Houli as a repulsive saturnalia. It may therefore be taken as certain that recommendations for a local examination in India will never get beyond a show of hands at some ebullition in the Town Hall of Calcutta, or the hasty utterances of an M.P. on the annual Indian Budget. If, then, natives are to enter the Civil Service, as they have done in some instances, the entrance must be effected by the prescribed avenue and under the existing tests. It is often said that we are unduly monopolizing offices and depriving natives of those opportunities of distinction which, under a Hindu Raja or a Mohammedan usurper, they would certainly have commanded. But it seems to be overlooked that the British power is the first which has ever given to India a fixed and stable government conducted on civilized principles, with an official hierarchy, regular grades, promotions, pensions, and that certainty of tenure without which public service becomes a mere scramble or a game of chance. This order and harmony are of our own creation, and we have a clear right to define under what conditions natives shall be admitted to take part in their maintenance. The local Government of Bengal is, we understand, grappling with the difficulty in another way. The present Lieutenant-Governor, Mr. Ashley Eden, adopting a scheme laid down by Sir R. Temple before his transfer to Bombay, is desirous of appointing about eleven natives to highly paid judicial appointments, and he would reward about half a dozen others in the executive branches by allotting to them higher emoluments than they have hitherto enjoyed. To place a native in supreme executive and independent charge of a large district, where vigour, fearlessness, and firm impartiality are requisite to deal with men of two rival religions, is simply out of the question. The natives, as yet, have not shown backbone enough. But it may be possible to employ them more largely in the judicial service, and indeed it is in contemplation to relieve the High Courts of some of their arrears, and to appoint an appellate tribunal, between the High Court and the district offices, in which one Judge shall be a native and the other a covenanted civilian, with the prospect of rising to judicial posts of 1,800*l.*, 2,200*l.*, and 3,000*l.* a year. A native would then have no reason to complain of exclusion from high offices.

It seems to us that some such plan as this promises better than well-meaning attempts to flood the regular service with young

Parsees and Bengali graduates of the University; and it gets rid of another difficulty which has already been felt in some measure, and which it was proposed to remove by creating embarrassments of a fresh kind. For instance, it has been said that when you have got your natives into the regular Civil Service by competition, you can utilize their talents by placing them only in that line for which they have evinced a special aptitude. Grant that they cannot be Superintendents of Police, Commissioners of Division, or magistrates in independent charge of districts, still you can convert them into very good assistant or subordinate Judges, into Judges of Districts, and of Appellate and High Courts. To this it is replied that hitherto members of the Civil Service have been thought qualified to fill every kind of post, and to be equal to every sort of responsibility. The Assistant of one generation has expanded in the next into the Lieutenant-Governor or Governor of a Presidency. Commissioners have become Judges of High Courts, and from the High Court men have been taken to fill places in the Secretariat and the Council. Even supposing that henceforth some rigid line will be drawn between the executive and the judicial agency, and that, after a certain period of service, a Civil Servant will be expected to make his final choice between one and the other, yet it will hardly do to lay it down broadly that natives, though to all intents Civil Servants, may fill the one branch and not the other. It would be rather like saying that, in the army, Englishmen are expected to storm hill-forts and to put down insurrections, while Sepoys might collect the revenue, form the reserve, or do duty in autumnal manoeuvres. The correct principle surely is that no one has any business inside the magic circle of the Civil Service of India who cannot be relied on, in theory at least, to do anything and to go anywhere he is bid. Nor are Judges in India so entirely relieved of executive work as is popularly thought. In England a Judge is generally supposed to be an elevated, impartial being, instructed by an intelligent and independent Bar, kept straight, if disposed to err, by a vigilant press, above all local prejudice or political animosity, with nothing to do but to decide cases as they are brought before him, not bound to originate anything or to take judicial action at all. But a District Judge in India cannot avoid doing many things at which the hair of English barristers would stand on end. He has to exercise a constant supervision over at least half a dozen native subordinates in civil and miscellaneous suits. He is the ultimate appeal from three or four officials vested with criminal powers, and has to come down on them if they are inclined to indulge in vagaries. It is his duty to call for statements and returns, to take the initiative in showing how new enactments are to be worked, to keep files clear, to prevent intricate cases in Courts below him from lagging discreditably, to put suits into proper shape, to decide what evidence shall be called for, to be occasionally counsel for both sides and jury as well as judge, to hold the scales evenly in times of excitement when religious controversy or national antipathies have inflamed men's passions, and to discharge all these duties in places far removed from a healthy opinion, with a dead certainty that his conduct will be adversely criticized by Hindus or by Mahomedans, by English capitalists, by native landholders, by the partisans of the peasant proprietors and the opulent middle men. It is tolerably certain that very few educated natives would stand this test.

Mr. Eden's plan may be open to criticism in details, but something has to be done for the native community; and his scheme seems to us to be freer from objections and to have more of the elements of success about it than any other. If adopted and enlarged, it will necessarily follow that, so far from encouraging young natives to visit England and enter the Civil Service, it may be politic to discourage them and to rule boldly that the Civil or Imperial Service shall be recruited by Englishmen alone. All sorts of alluring proclamations have been addressed to the youths of England to get them to enter that same service. They have been told of early independence and marriage, high responsibilities, and ennobling aims; how one man has been already twice Secretary to his Government, and another has influenced the whole course of vernacular education or the policy of a half-civilized native Court; how far inferior is a clerkship in the City or the cure of a country parish to the ordinary executive charge of a district where the population is numbered by hundreds of thousands. When we talk of redemption of pledges, these pledges must be equally kept with those given to natives, for on their observance depend the good faith of the Government and the loyalty of the service. Mr. Ashley Eden, as we make out, would get out of the dilemma by allotting or creating certain offices to be henceforth filled exclusively by natives, marking out such by very clear and defined lines, outside the Covenanted Service, and assigning to the holders salaries which would gratify their honourable ambition. We should then in future recruit the Civil Service with fewer members, but Englishmen would have a certain field of employment entirely to themselves. Natives would begin work at an early age in India without the expense of an education in England, and they would rise by proved fitness and have no just cause of complaint. The Civil Service, constituted entirely of Englishmen, would still be the body to control, direct, and animate the administration. In this way several great principles would be observed. Natives would have a larger share in the administration of affairs. English scholars would know exactly what to expect, and would not be deceived under false pretensions. The Government would have agents on whom it could confidently rely to keep up the traditions of office and to maintain a vigorous and firm grasp of

power. It is fortunate that the present Lieutenant-Governor of Bengal is one who knows his native subjects thoroughly, who in past years has undergone unmerited obloquy in defence of their rights, and who may be trusted, while rebuking undue and absurd pretensions, to carry out some well-devised scheme that shall not lower the Civil Service to the level of native capacity, but shall gradually elevate Hindus and Mahomedans to the European standard and measurement.

SOMETHING LIKE A GROCER.

THE Grocers' Company has tasted an unexpected pleasure. To give dinners to distinguished persons has always been among the most valued privileges of the hospitable city corporations; but it does not often fall to their lot to give a dinner to a member of their own mystery. Indeed, as a rule, the craft from which the Company takes its name is no more represented at the Court table than any other. It was not thus with the Grocers' Company on Tuesday. They did honour to Homeric archæology in the person of Dr. Schliemann, and before the evening was over they discovered that they had been entertaining a grocer unawares. In returning thanks to the Company for drinking his health, the explorer of Troy and Mycenæ claimed to be himself a grocer. This was not a half-jocose and half-condescending speech such as those in which a politician calls himself a working-man. Dr. Schliemann's connexion with the grocery trade has nothing to do with analogies or figure of speech. He began life as a genuine grocer, and he remained a genuine grocer for twenty-eight years. A "general shop" in Mecklenburg was the scene of his first introduction to the trade, and here for five years and a half he sold halfpennyworths of herrings, butter, salt, whisky, sugar, and coffee. It was a white day in the shop calendar if they sold 2*l.* worth of goods in a day. In the next four years he was first porter to a wholesale grocer in Amsterdam, and then correspondent and bookkeeper to another wholesale grocer in the same city. This latter firm sent him out to St. Petersburg as their agent, and there he set up business on his own account, and went on trading until in 1864 he had saved money enough to retire. Dr. Schliemann was still a young man, and, devoted as he was to the grocery trade, he had found time to think of something besides sugar. As soon as he left the general shop at Mecklenburg, he began to make up for his neglected education, and through the twenty years which followed he persisted in continuing his studies. When the opportunity for retirement came, he reaped the benefit of his industry. He found that he had sufficient theoretical knowledge to devote the remainder of his life to Homeric archæology.

Dr. Schliemann has every right to speak well of grocery, and certainly no apostle ever magnified his office with greater strength of conviction or more plenitude of good will. It is grocery, he says, that has made him what he is. It is to the habits formed in sweet communion with herrings, coffee, and spices that he owes his success as an explorer. Had he not been a grocer, he doubts whether he would ever have discovered Troy, or brought to light the royal sepulchres at Mycenæ. To him the sale of groceries has been a liberal education. Thoroughness, tact, system, and perseverance—these have been the qualifications which have stood him in such good stead during his archæological explorations, and it is behind the grocer's counter that he has studied and practised them. To do nothing superficially or at the wrong time, to manage men so as to get from every one the best work of which he is capable, to abandon no enterprise until it has yielded its richest fruits, have been the rules of Dr. Schliemann's later career; but it is not at Troy or Mycenæ that he first learned to obey them. The halfpennyworths of the general shop at Mecklenburg and the larger transactions which gave him employment for eighteen years at St. Petersburg have been his real school. It is no wonder that, when such results as these have been gained from the grocer's trade, Dr. Schliemann should hold it in high esteem. We shall not be far wrong, perhaps, if we give a particular application to the praise of commerce in general with which Dr. Schliemann ended his speech. Modesty would not let him say that without grocers there could be no ambition, and without ambition there could be no science, and thus without grocers men would be brutes. Yet this seems scarcely too much to predicate of a trade which evokes and perfects such intellectual and moral virtues as those enumerated by Dr. Schliemann. Perhaps it is to some secret and unsuspected harmony of physical and moral conditions that this superiority is owing. Every one must have noticed the peculiarly searching odour that pervades such a shop as that in which Dr. Schliemann began his career. Subtle influences lead the occasional visitor to put his handkerchief to his nose, or to remove with his finger the tear that wells up unconsciously in his eye. To the rightly constituted spirit these vapours may be like the scent of a pine forest. Vigour of mind and body may be borne on every breeze. The particular pursuits for which Dr. Schliemann was at this time being prepared may also have a special affinity with another aspect of the trade. The explorer of antiquity must know no distinction between the great and the little. The meanest trifle may put him on the road which is to end in success. The slightest variation in the contour of the ground may be to him an indication of buried treasure. Just as the study of the classical languages awakens the sense of minute distinctions in style and meaning, the continual observation of sugar or butter may awaken a sense of minute dis-

functions of a physical kind. The merchant who watched the youthful Schliemann thoughtfully weighing a sample of sugar in his palm perhaps deemed that he was only seeking to detect the sand which might be mixed with it, or to divine from its colour or texture the degree of sweetness which it would impart to a customer's pudding. He little dreamed that this seemingly commonplace process was training the faculty which would in the end reveal to its possessor the last resting-place of Agamemnon. Even the habit of making everything up into the minutest possible parcels may not have been without its use at Troy or Mycenæ. A trader who has to do with halfpenny-worths cannot afford to be superficial, or to despise the day of small things.

Are we over-sanguine in regarding this fragment of Dr. Schliemann's autobiography as the key which will unlock more than one of the educational and social problems which perplex our age? What is the want of which men of culture are everywhere complaining most loudly? A career. But if to be a grocer is, so far as training can ensure it, to be a Schliemann, there is surely a career ready to their hands. It has, it is true, been whispered that there are already too many grocers in the world; but this may only hold good of commonplace grocers. Men who bring the whole power of their intellect and the whole strength of their resolution to the trade will probably find that it has capabilities which have never been suspected. It might indeed be well if only those who have some other means of support than their own labour were to take up this fascinating pursuit. Such a limitation might be thought to bear too heavily on those who, with equal powers of profiting by the grocer's craft, would be shut out from it by the inequalities of fortune. But to argue in this way is to forget that differences of wealth are among the postulates of civilized existence. It is a hardship that one clever young man should be sent to the University because his father is rich, while another just as clever has to earn his own living from the time he is sixteen because his father is poor. But it is a hardship which it is no use to mourn over, and the privilege of being a grocer ought to be regarded in just the same light. The mention of Universities suggests the inquiry whether there might not be a school or faculty of grocery. Dr. Schliemann has shown, both by precept and practice, what a close alliance there is between this favoured trade and the investigation of classical antiquity, and Oxford and Cambridge might do well to consider whether a new member ought not to be admitted to the sisterhood of the liberal arts. Oxford in particular, which is perpetually remodelling her educational system, might gain a useful hint from Dr. Schliemann's speech. This famous University is sorely troubled what to do with her passmen. She is too conscientious to leave them in the undisturbed enjoyment of that magnificent ignorance with which they mostly come up, and which they would gladly take away with them when they depart. The consequence is that learning has to be broken up into a thousand portions, in the hope that in some one of them a passman may go in and out and find pasture. History is subdivided into almost as many periods as there are centuries; law is administered in doses of homœopathic minuteness; classics are already shorn of their old pre-eminence, and are threatened with still further degradation, and all for the same reason—to provide a passman with a subject in which he may, if possible, pass. Why then should not a man take a degree in grocery as well as in arts, or history, or natural science, or in such fractional parts of these subjects as it pleases the University to accept as a test of proficiency? When the Modern History School was founded at Oxford, Hallam came up to be one of the first examiners, and he thus gave dignity to the new study. In like manner Dr. Schliemann would perhaps consent to be among the first examiners in grocery. The Co-operative Stores might be raised to the rank of affiliated Colleges, since it would be scarcely possible within the precincts of a University town to get sufficient opportunities of study. Tying up parcels or weighing out ounces of pepper is a work which might easily become tame and perfunctory if it was done merely for practice and with no relation to the real business of life. The "assistants" at the Stores might all be undergraduates, and the fees paid by them might help still further to reduce prices. If we seem to have depicted a retail millennium, we can point to Dr. Schliemann for proof that it is not beyond all hope of realization.

THE POETRY PROFESSORSHIP AT OXFORD.

IT may seem rather strange that the Professorship of Poetry at Oxford, to which Mr. Shairp has just been elected, should have been founded in what Mr. Mark Pattison has lately designated as *seculum rationalisticum*, the prosaic eighteenth century. To be sure it was close on the beginning of the century that Henry Birkhead, a late Fellow of All Souls, and Barrister of the Inner Temple—not a very poetical vocation—established the Chair and endowed it with the modest stipend of 100*l.* a year. The first professor, Joseph Trapp, Fellow of Wadham, was elected in 1708, when the more romantic memories of the previous age may still have lingered in the cloistered Halls of Oxford. The most distinguished occupant of the Chair during that century was Bishop Lowth, as he afterwards became, who held the office from 1741 to 1751. During the first half of the present century it was held by Bishop Copleston and Mr. Keble, whose *Praelectiones* are still remembered as models of pure Latin; and between them came Dr. Milman. Up to that time the original

provision of the statute of foundation requiring the professors to lecture in Latin had been strictly maintained. Keble was the last man to rebel against such restrictions, though many of his admirers who are little able to appreciate the exquisite scholarship of his two volumes of *Praelectiones*, may be tempted to wish it had been otherwise. And his two essays lately republished, on Sacred Poetry and on Copleston's *Praelectiones*, to which may be added that on Sir Walter Scott, where he worked out his theory of the essential nature and characteristics of poetry, will increase their regret that what Dr. Newman calls "his greatest literary work," on the same subject, is in a language they cannot readily follow. At all events the rule was altered soon afterwards, Mr. Matthew Arnold being, we believe, the first Professor to lecture in English. In modern Oxford the ladies would be sure to form an important element in the audience on such occasions; but of the new town that has grown up beyond "the Parks," and the bevy of fair *professorinnen*, as Denn Mansell once styled them, who now overflow not only the galleries of the Union on debate nights but even the sacred precincts of the Convocation House, neither Henry Birkhead nor the recipients of his bounty for a century and a half afterwards ever dreamed. They have come in, like the Sabine women of old, to reconcile the past of the city with its future. And, at least until that undesirable day, if it ever dawns, when the rights of women are finally vindicated and "sweet girl graduates" sit beside their brothers to learn Latin and Greek in the lecture-rooms of Eton and Oxford, we may be sure the ladies will take care that the old restriction shall not be reimposed on the Poetry Professor.

Principal Shairp of St. Andrews, as our readers are aware, was elected to the Chair without opposition on Thursday last, and Oxford will certainly have no reason to regret her choice; indeed we are disposed to think it the best that could have been made. He was elected without opposition because the other competitors had previously retired from the field. But it is worth noting, both for his sake and theirs, that with the exception of one candidate who came forward at the last moment, nobody knew why, and who never had the slightest chance, the field was a formidable one. Of those who would have divided the suffrages of Convocation with Mr. Shairp, if they had been advised to go to the poll, there is not one who would not have more than respectably filled the Chair. And, as it is not held for life, but nominally for five and practically for ten years—for the Professor is almost always re-elected—and the other candidates are younger men than Mr. Shairp, it is pleasant to think that they may have future opportunities of seeking the post. Mr. Palgrave, second son of the late Sir Francis Palgrave, is known both as a writer and critic of poetry, but chiefly in the latter capacity; to the general public he is familiar as the compiler of the *Golden Treasury*. Mr. Symonds, though a younger man, has been a much more voluminous author. His *Studies of the Greek Poets* and his *Renaissance in Italy*—the latest volume of which we reviewed the other day—have secured him a wide reputation, though we are not sure that the former work did not partly contribute to his failure in obtaining adequate support at Oxford. The emphatic and unequivocal assertion of "Hellenism" pure and simple in the second volume of his *Greek Poets*, and that in avowed antithesis to the theistic basis of "modern morality," has been, not perhaps unnaturally, quoted against him, and certainly not without effect. In another way, too, he was unfortunate. His old College, Balliol, was necessarily divided between his claims and Mr. Shairp's, both of whom had been formerly Scholars there. His present College, Magdalen, was less than lukewarm in his cause, probably on Conservative grounds, which always play an important part in Oxford elections, for Mr. Symonds is accounted a Liberal, and Magdalen is the traditional stronghold of Conservatism. He had difficulties therefore to contend with, alike theological, political, and collegiate. The remaining candidate, Mr. Courthope of New College, though less widely known than Mr. Symonds and belonging to a very different school of thought, possesses claims far from inconsiderable. Both of them, as appears from his published letters, were intimate friends and correspondents of the late John Conington, whose friendship was in itself a kind of testimonial of distinction; and Mr. Courthope, like Mr. Symonds, has given unmistakable proof of a refined and highly cultivated taste. His *Paradise of Birds* is one of the cleverest and most charming of burlesques, and the articles attributed to him in the *Quarterly Review* are equally remarkable for critical power and felicity of diction. There can be no doubt that either his lectures or Mr. Symonds's, if either of them should hereafter be called to the Chair of Poetry, will be full of interest.

Meanwhile, as we have already intimated, Oxford may safely be congratulated on the choice of Professor Shairp. Like Mr. Courthope, he is an old Newdegate, and a poem of his was published some years ago in *Macmillan*, describing with exquisite grace and delicacy of touch the Balliol of his own day and his companions at the Scholars' table, some of whom have since risen to eminence, while others, whose memories are still fragrant in their old home, have been prematurely called away from earth. But to the general public he is chiefly known by his *Studies in Philosophy and Poetry*—especially the chapters on Wordsworth and Keble—and his *Lectures on Culture and Religion*; and readers of those volumes, whether they always agree with him or not, will be sure to give a ready welcome to any future work from the same pen. How much in point of quantity we are likely to receive from him is another matter. We are not aware what are the exact require-

ments of the statute, but they certainly are not and could not be made very onerous, while the endowment remains so small. It was urged in Mr. Symonds's favour that, if elected, he would reside part of the year in Oxford and deliver a course of lectures. This, we are afraid, would be impossible for Mr. Shairp, who is Principal of a College in the distant University of St. Andrews, but he might be able perhaps from time to time to come up for a week or a fortnight and lecture at Oxford, where he could always count on meeting with a friendly and appreciative audience. Nor would their appreciation be likely to be diminished by the discovery that to his mind "culture," of which he is hardly a less zealous advocate than Mr. Matthew Arnold himself, can never become in itself a complete and adequate end, or, as he prefers to phrase it—in language which is fairly open to criticism—"seems then only worthy of serious regard when it ministers to faith." Mr. Arnold indeed speaks in hardly less emphatic terms of the religious aspects of culture; but then by religion he means avowedly something very different from what Christian believers usually understand by the name, whereas of Mr. Shairp's genuine faith in Christianity, as it is received by the most cultivated and thoughtful but also most devout members of the Scottish Presbyterian Communion, his writings leave us in no manner of doubt. To him the true poet is necessarily a *rites sacer*, discharging something of the office of a prophet and a priest. And if there is any ground for charging a school of highly-wrought classical æstheticism, which is rising into notice in our own day, with a tendency to reproduce the evil influences of that Pagan revival of the fifteenth century so elaborately exhibited in Mr. Symonds's latest publication, the new Professor of Poetry is just the man to detect and expose it, not with the sledge-hammer of a Philistine iconoclast, but with the discriminating sympathy of a friend to whom Plato is dear but truth is dearer. He admits that, ideally considered, "culture, or the impulse in man to seek his own perfection," ought to culminate in "religion, or the impulse in man to seek God"; but he will not allow the former to usurp the name and place of the latter, and insists that in Greece, the birthplace of intellectual culture, such religion as there was was divorced from morality. Hellenism, to use the terminology of another "culturist," is only safe, in his judgment, when it recognizes the higher claim of Christianity. "Jerusalem is the fountain-head of religious knowledge to the world, as Athens is of secular." But we must not diverge into a comment on Mr. Shairp's earlier writings. We have only referred to them in order to show in what spirit he may be expected to treat the many-sided and inspiring theme on which it will henceforth be his duty to discourse from the Chair which he has been so fitly called to occupy at Oxford.

MORMON DIFFICULTIES.

It has long been foreseen that some day or other there must in all probability be a collision between the United States Government and the so-called Church of the Latter Day Saints, or, as they are commonly styled, Mormons, of Utah, though when it will come is still doubtful. The peculiar social and political character of the latter body necessarily makes it an anomalous element in American life, and a standing difficulty for the Government; and from time to time there has been an apparent danger of an open rupture; and, indeed, more than once actual strife. In 1857 President Buchanan in an official address recommended that an imposing military force should be despatched against the Mormons for the purpose of compelling them to submit to the authority of the States; and in 1859 an army under General Johnston took the field, but did not make much head against the Nauvoo Legion, and after a while was withdrawn. Again, in 1870, the House of Representatives passed a Bill for depriving the Mormon polygamists of the rights of citizens, and punishing them by fine and imprisonment; but this was only an empty threat. On the whole, then, it would seem that the Mormons have pretty well held their ground, and that in the United States there is a disposition to let things alone. Recently, however, the trial of John D. Lee, a prominent member of the Mormon community, for having taken a leading part in a massacre in 1857 of Arkansas emigrants while on their way through the Salt Lake country, has tended to reopen the question of the relations between the States and the Mormons. Lee was convicted of the crime of which he was accused, and executed in March last; and before his death he wrote out a confession, as to which there is a certain degree of mystery, but which is said to contain statements implicating other leading men in Utah. It is difficult to say whether the hostility of the Americans to the Mormons is at present very deep or only superficial; but the *New York Herald* has taken the lead in stirring up an agitation on the subject, and calling for a complete and exhaustive inquiry as to the Mountain Meadows massacre, which was certainly a very horrible affair—not only men, but women and children, being slaughtered in cold blood. According to the Mormon explanation of the event, it was got up by the Indians, and the Mormons were only accidentally mixed up with it; but the evidence at Lee's trial clearly proved that the murderous outrage was not only mainly perpetrated, but deliberately planned, by the Mormons. Indeed, there can be very little doubt that Lee, though he played the chief part in the business, was not the only person responsible for what occurred, for he would never have dared to do so on his own account, and without some kind of orders or instigation from his

superiors. It is also asserted that there is a long list of known murders or suspected assassinations to be inquired into.

How far these charges can be brought home to those against whom they are directed, among whom the principal one is of course Brigham Young himself, it is impossible at present to know; but, in the meantime, the *New York Herald* is certainly doing all it can to bring about a crisis. Almost every day it has some alleged revelations as to the conduct of the Mormon leaders, or fierce denunciations of Mormonism generally. "Away, then," it says in one of its articles, "with this bestial, blasphemous, and bloodstained congregation, which insults God in the midst of His grandest works, and the noblest and grandest feelings of man under the flag of our Republic. Let Mormonism be extirpated from the land by the Samson of the law, even if its adherents should be buried beneath the ruins of its temple." The headings of the news columns are in a similar strain:—"Satan's Agencies," "A Mormon Wife and Mother pictures her Degradation," "The Reign of Terror vividly described," "Mormon Rebels," "Brigham's Blood Address," "Crimes to be Punished," and *syon*. The *Herald*, in fact, has in its characteristic way opened up a public inquisition into the alleged crimes of the Mormons without waiting for the official intervention of the United States Government. It is stated, indeed, that the Grand Jury at "Salt Lake City will meet on the 21st inst." (May); and that "subpenas are issued for a formidable number of witnesses in criminal cases; and arrests of murderers, who have had immunity for years, are imminent in the mountains and along the borders where they have secluded themselves"; and the suggestive remark is added:—"The sword of justice hangs over the roof of many a suspected assassin eminent in the councils of the Mormon priesthood, and it is not unlikely that the doctrine of blood atonement will be brought before the close of summer home to their hearts and throats." This style of language has naturally created a good deal of excitement in Utah, and the leading men protest indignantly against it. It is also said that the Mormon militia, formerly put down by the American authorities, has now been reorganized, and is secretly drilling. However this may be, it seems to be true that the Governor of the Territory has asked the Secretary of War to reinforce the United States garrison in Utah, his reasons being, as reported by a Correspondent of the *Herald*, that "there is here an anomalous condition of affairs, the population of the Territory being composed of two distinct elements, the Mormons and the Gentiles, and at a critical juncture there might be more or less conflict between them"; and "the presence of additional Federal soldiers would have a salutary effect." It is calculated that the population of Utah consists of 100,000 Mormons and 15,000 Gentiles, the Mormons in Salt Lake City being about 16,000 and the Gentiles only 4,000. Under these circumstances, it may be assumed that, if a conflict occurred, the minority would be in a very hopeless position, unless they obtained the support of the Federal troops. It is possibly because they rely on this that the Gentiles have had the boldness to hold a meeting in which they have passed resolutions denouncing polygamy, and calling for its suppression. It is proposed that "any persons practising bigamy or polygamy shall be entirely disfranchised, and cut off from any share in the affairs of the Territory; that they shall not be eligible to vote or hold any office of trust or emolument under the law, and shall be practically branded as criminals by their fellow-men." Mr. Brigham Young, however, says, "he does not believe in polygamy, which means a plurality of wives and husbands, but only in polygenny," as he calls it, "which means a plurality of wives."

It is necessary of course to be cautious as to accepting the reports that appear in such a paper as the *New York Herald*, which may have for its object merely the dissemination of sensational news for commercial purposes. The sort of testimony which is published in its columns against the Mormons tends in a certain degree to justify this suspicion, for it is of a very worthless kind. For instance, no authentic copy of Lee's confession has come to light; and the gossip and scandal of such persons as Mrs. Webb, "mother of Ann Eliza, the recently divorced wife of Brigham Young"; Mrs. Orson Pratt, the wife of the apostle of that name, who quarrelled with her husband as to the number of his wives, and now supplies an account of his "Harem" to a newspaper; or "Idaho Bill," who is "reported to be as freakish and slippery a scamp as there is in all this Western region," and is, in fact, a convict in prison at this moment, cannot inspire much confidence. Still, from what is known of the circumstances of the case, it is not improbable that the general statements as to possible disturbances, though they may be exaggerated, rest upon a basis of fact. There can be little doubt that the Mormon community contains in itself the seeds of its future dissolution. The Mormon settlers in the United States were expelled from Missouri and Illinois, where they had first established themselves; and it was only by securing for a time complete isolation in Utah that they obtained a footing in the country. They were for a series of years a people quite by themselves, with no strangers to trouble them; and if they could have maintained this seclusion, the difficulties which now beset them would not have occurred. It is the opening up of the region by the Pacific Railway which has in a great measure broken down the conditions under which alone the Mormon community could exist in its peculiar form. Though the Gentiles within its bounds are still a small minority, they are increasing both in numbers and influence, and may be expected to continue to do so. Moreover, there are signs that the Mormons do not hold together as they

used to do. Differences of opinion have arisen as to the system, and it would appear that, though polygamy still prevails in theory, it is not so generally practised as formerly. The authority which Brigham Young has hitherto possessed has been due to his connexion with Joseph Smith, and also, in a large degree, to his own tact and energy. He has had to deal with a very ignorant and fanatical set of subjects, by whom he has been accepted as receiving direct inspiration from Heaven, and therefore entitled to blind and implicit obedience when he issues a decree. Moreover, the early comers were hard-working, spare-living people who were content with a very simple style of life, and the produce of their hands. But now, in all these respects, a change has been going on which cannot fail to spread. The introduction of the Gentile element as permanent residents; the multitude of strangers from all parts who visit Utah every year; the growth of trade and commercial relations with the outside world; the accumulation of wealth and taste for luxury in the richer classes, must all tend to disturb old habits and traditions, while freedom of thought and new ideas are continually impairing the ignorant devotion of the lower classes who formerly formed the bulk of the community. Utah is now an open Territory, and the inhabitants cannot long resist the influences to which they are exposed. The colonization of the region by the "Gentiles" will also be quickened by the railway communications which now exist, and the progressive cultivation of the land; and the organized institutions of the Republic will thus be brought close upon a community which cannot retain its special character amidst such associations. If the Federal Government were to resolve to clear off the Mormons by force, it would no doubt be met by a desperate resistance; but there is no likelihood of this unless it is provoked by serious disorders, and the law has other means of bringing about an assimilation of the Saints to the body of the nation in the practice of morality and submission to civil authority.

THE ROYAL ACADEMY.

IV.

IN our second article on the Royal Academy we were still considering the pictures in the Great Gallery, and had not yet noticed a fine work by Mr. Pettie (272), "A Lady of the Seventeenth Century." This is painted in obvious imitation of Van Dyck's manner, and perhaps one cannot give it higher praise than by saying that the imitation is successful. The lady, who stands in an easy yet imposing attitude, wears a light blue dress relieved with a red flower at the breast, and over the dress hangs a black cloak with a fur edging. The painting of the different textures is masterly and unaffected, and the flesh tints are firm without roughness. On the same wall hangs Mr. John Collier's portrait of Mrs. Forster (262), which, although less striking than the companion picture which we have already noticed, is an excellent, straightforward piece of work. A portrait by another young painter, Mr. A. Stuart Wortley, "The Countess of Wharfedale" (240), is painted with much care and gives evidence of the artist's progress; but it is unfortunately hung. Mr. Watts's portrait of Miss Dorothy Tennant (267) is less pleasing than Mr. Millais's rendering of the same subject, which was exhibited, if we remember rightly, two years ago. Mr. Sant has two portraits in this room (164, 212). Mr. Poynter sends a portrait of Mrs. Archibald Milman (169) which is extremely hard, and in which the tapestry at the back is so painted that one of the figures stands out in bold relief, and may at a first glance be taken for an actual person.

Among the subject pictures the most charming in this gallery, and, we are disposed to think, the most charming in the whole Academy, is Mr. Leighton's "Music Lesson" (209). This is an exquisitely lovely representation of a young mother clad in loose drapery of green, white, and gold, teaching the hand of a child dressed in blue to touch rightly the strings of an instrument resembling a guitar. The feet and part of the legs of both figures are bare, and hang over the couch on which they are sitting with marvellous grace. The tender and graceful feeling of the group is as perfect as is the harmonizing of the different tints employed; and it is impossible to imagine anything more beautiful than the flesh tints. It might be said that no real flesh is quite so smooth and clear as this, and perhaps the best answer to such a criticism would be that the fact is unfortunate. Quite as lovely in treatment, but less full of poetry, is Mr. Leighton's "Study" (268), a charming little girl in a pink dress, bending with childlike seriousness over a large book. Mr. Calderon's picture (215), to which are affixed Mr. Tenyson's lines beginning "Home they brought her warrior dead," is a somewhat disappointing work. In the figure of the widow who, kneeling on the ground, clasps her child to her breast, there is pathos; but it is marred by the vulgarity of the group on the left, in which an odious little girl is peering over the back of a chair to see what goes on, just as she might over the front of a box at a pantomime. The steel-clad toes and legs of the dead warrior on the bed are not very happily managed, and the white cap of the commonplace old nurse, who bears her ninety years with surprising alacrity, is painfully prominent. Mr. Faed's "In Time of War" (266), if, as one would think, it is intended to be pathetic, has not hit its mark with any great success. It is a large and elaborate study of a cottage interior, containing a mother and child, two boys asleep on a bed, a cat, and various basins, pans, and boots, which are portrayed with great

reality. Why it should be called "In Time of War," it is difficult to imagine. Mr. Eyre Crowe's "Silkworms" (184) is an elaborate and uninteresting representation of a group of bluecoat boys excited over those creatures for which schoolboys have a strange fondness. "Strangers Yet" (186), by Mr. W. Sellon, and "The Cares of a Family" (230), by Mr. W. B. Baird, are both clever and pleasant studies of birds. "La Siesta" (251), by Miss Florence Bonneau, hanging next to the last-named picture, is a graceful and careful picture, suggested perhaps by Mr. Alma-Tadema's works, of a Roman woman lying lazily by the side of a bath or impluvium. The colour in the foreground is killed by the too great warmth of the reflections at the back. Mr. Marks's "A Bit of Blue" (246) is a charmingly minute representation of an old gentleman handling with loving care a lately arrived china treasure. The truth of the accessories is admirable, and the only point to which exception can be taken is the painting of the hands, which are far less real than the china, or even the shavings in which it has been wrapped. Among the landscapes not yet noticed we may for the present point to Mr. Vicat Cole's "Summer Showers" (239), the truth of which is marred by the solidity of the sky and water, and Mr. Aumonier's "Easton Broad, Suffolk" (265), which is a large and happy example of this painter's style.

Turning for a while to the Grosvenor Gallery, we will, out of several contributions from Mr. Tissot, who is not represented at the Royal Academy, consider first the most ambitious of his pictures. This, which is numbered 22, and hangs with his others in the East Gallery, is the first of a series which is described in the Catalogue as a "Poem in five parts." There seems no more reason why a series of paintings should be called a poem than why Mr. Whistler's strange performances should be called Harmonies and Nocturnes. If it is intended to suggest that the pictures are full of poetical feeling, then the suggestion, as far at least as this particular one is concerned, is, we venture to think, misleading. The explanation of the picture in the Catalogue runs thus:—"I. The Challenge. The Will, attended by two pages, Audacity (active) and Silence (passive), triumphs over Vice and Temptation." Vice and Temptation are, we imagine, represented by the hideous figure, half woman half tigress, which lies prostrate in the foreground. A lay figure in the guise of a woman, with a leg exhibiting the agony of stiffness peculiar to lay figures' legs, tramples on this prostrate form. The figure is habited in armour, beneath which various signs of modern dress may be detected, while the arrangement of the hair is evidently modern. Possibly the four uncompleted pictures which are to belong to the series may in time throw some light on the painter's meaning; meanwhile, the first of the set appears to be a performance of considerable humour. In the same gallery hangs a "Portrait of Lady Lindsay" (of Balcarres), by Mr. Watts (34). Apart from the question of technical excellence, we are inclined to prefer the treatment of the same subject by Sir Coutts Lindsay in the West Gallery (43). Three pictures by Mr. Albert Moore, of varying sizes (50, 51, 52), have all the charm of combined softness and strength which this painter always gives to the figures that he clothes with daintily disposed drapery, coloured so that the eye loves to rest on it. M. Legros sends nine works. In some respects the most striking of these are four studies (72, 73, 74, 75), executed in two hours each before his pupils at the Slade Schools. The mastery and facility exhibited in them are very great. The same painter's "Le Chaudronnier" (78), which has been seen before in London, is a fine treatment of a commonplace subject, while "Le Cloître Espagnol" (79) is a successful imitation of the somewhat pedantic yet impressive style of certain Dutch masters.

Returning to the Royal Academy and passing into Gallery IV., we may notice the humour of Mr. E. Benson's "The Last Wren-winner" (289), and the want of any real humour in Mr. Calderon's "Reduced Three per Cents" (311). Near to this hangs Mr. Marks's "The Spider and the Fly" (313), a cavalier habited in yellow sitting on the table of an old usurer, with whom he is driving a bargain. Here the painter's great command of detail comes out in full force, and the only objection to be taken to the general effect is that the cavalier's yellow costume is not altogether pleasant in tone. Mr. Joseph Knight's "A Tidal River" (329) is a fine landscape, and so, in a naturally warmer tone, is Mr. F. A. Bridgman's "Towing on the Nile" (344). Near this is a picture called "Critics on Costume; Fashions Change" (343), by Mr. Horsley, R.A., upon which we can only observe that it is unfortunate that Mr. Horsley's fashion of painting does not change. Mr. A. W. May's landscape, "A Bend in the River" (359), is a work of much delicacy, in which something of Corot's feeling for the changing moods of nature has been caught. The picture represents a cool green island or eyot in the middle of a river, with adjuncts in the foreground of trees, rushes, and herons. The soft light on sky and water is excellent, and the whole aspect of the scene singularly true. A yet more charming landscape is Mr. Mark Fisher's "The Meadows" (364), a picture of cattle in a sodden field which is so painted as to be refreshing to look at. Mr. Morris's "The Heir of the Manor" (374) is a pretty composition, full of sunlight. Sir John Gilbert's "Doge and Senators of Venice in Council" (366) is a fine work, more happy in colour than the same painter's larger contribution in the great gallery. Mr. John O'Connor's "High Level Bridge, Newcastle-on-Tyne" (368) brings the scene which the painter has chosen with striking reality before the spectator.

THE THEATRES.

THE management of the Lyceum Theatre has not perhaps done unwisely in varying the course of Shakspeare which it has for some time past set before its audiences. One may weary even of the best entertainments for body or mind if there is no break or change in them. Mr. Irving, upon whom falls the weight of all stage entertainments provided at the Lyceum, made some striking successes in the regions of melodrama before it was discovered that he could play Hamlet; and it is natural enough that, after the magnificent melodrama of *Richard III.*, he should betake himself to something which is still melodramatic, though not in so magnificent a way. There would have been a more complete change, and possibly a more complete success, if the actor had appeared in some part of high comedy, or, to use a technical expression, in some "character-part" which, while it would have afforded him rest, would also have given more scope for art than the comparatively simple task upon which he is now engaged. His performance, indeed, of this task appears to us to suffer somewhat from a desire to make an elaborate study of a character, or rather of two characters, which are too roughly drawn to admit of any great fineness in their interpretation. The authors of *Le Courier de Lyon* saw their account in a supposed case of mistaken identity which obtained great celebrity; and, adapting the facts to stage purposes, they made the supposed innocent man as good as possible, and paired it with corresponding blackness the highwayman said to have committed the crime for which another suffered. We have said the supposed innocent man, because, as has lately been pointed out by an ingenious critic, there seems to be considerable doubt whether after all it was not Lesurques who was concerned in the robbery for which he was executed. And the same critic has called attention to the fact that Lesurques, far from being the angel that he is represented to be in his domestic relations, was a man whose private character did not at all bear being pried into. On the other hand, although Dubosc was a professional robber, while Lesurques, if he was a robber at all, was only an amateur, he can scarcely have been the utter fiend which the playwrights have made of him. Of course the object of the stage is not, or ought not to be, to give an absolutely exact picture of real life; and we only point to these facts because the contrivers of *Le Courier de Lyon* made a blunder in giving too much of the stage glamour to the facts which supplied them with their play. To the effort after effect they deflected their own object, just as, to our thinking, Mr. Irving has somewhat spoiled his performance in the play by too much anxiety to make it striking.

The original French play from which that now performed at the Lyceum is taken was called *Le Courier de Lyon*, and was produced at the Gaiety in Paris in 1850. It was adapted for the English stage by Mr. Charles Reade, under the astounding title of *The Courier of Lyons*, and produced by Mr. Charles Kean at the Prince's Theatre in London in 1854. That a writer of Mr. Charles Reade's ability and knowledge should have made so strange a slip as was made in the title of the adaptation is surprising. "The Courier of Lyons" is just exactly such a translation of "*Le Courier de Lyon*" as "*Le Postillon de Calais*" would be of "*The Calais Mail*." *Courrier* in this instance means neither more nor less than mail-coach, as to which fact any one can satisfy himself by reference, if it is needed, to Littré. But indeed the employment of the word *courrier* in this sense is so frequent in French that it is difficult to understand how for many years actors and audiences can have allowed it to be supposed that the title of the play carries even a suggestion of the presence of the "courier" or guard of the mail, who, to judge from the English title long in use, should be a personage in the drama, and who really has nothing to do with it except to come on the stage and be killed. The exact translation of "*Le Courier de Lyon*" is "*The Lyons Mail*." This title was first given to the play by Mr. J. W. Clark, who wrote a very clever version of it for the A. D. C. at Cambridge; and in adopting this title the management of the Lyceum has done well. It was however not so well conceived to perpetuate the original blunder in bills which stated that the play was first produced in Paris under the title of "*The Courier of Lyons*." The same bills dwelt in moving terms upon the immense power of the stage as a moral agent, and supported this view by recording the wish of the Lesurques family that the real name of their ancestor should be used in the play, and their gratitude to the playwrights for so using it. Whether the name of Lesurques ever has been used in the play in Paris or not we cannot say; but it is quite certain that its use has been forbidden for some time past by the censorship, and that it is not used now. The play is still occasionally performed in Paris; but it is produced, not for the sake of whoever undertakes the two parts of Lesurques and Dubosc, but for that of M. Paulin Menier, who, out of the part of Choppard, the horse-dealer, has made a study somewhat analogous to that which Mr. Sothorn made of Lord Dundreary. The character was originally a subordinate one, but the actor, by means of some influence which appeals to a certain kind of Parisian audience, has made it the prominent feature of the piece. In the representation at the Lyceum this is certainly not the case; indeed, with two exceptions, there is nothing that calls for praise of any sort except Mr. Irving's well-meaning, but not altogether happy, attempt to apply his great and peculiar talent to a performance which is hardly worth so much trouble.

Although *Le Courier de Lyon* is a well-known play, it may not be amiss, before attempting any detailed criticism of its performance, to give a brief sketch of its plot. M. Joseph Lesurques, of Paris, is a man possessed of all virtues, and respected for that possession; he is moreover so wealthy that it is a delight to him to help his father, who is somehow an innkeeper in difficulties at Lieursaint, by an anonymous gift of money. To bestow this he rides down to the inn secretly, and disappears with equal secrecy. Within a few minutes of his disappearance arrives Dubosc, a robber celebrated for his prowess, at the head of a band bent on robbing the Lyons Mail. The resemblance between Lesurques and Dubosc is, in the play, so extraordinary that old Lesurques, shot for his untimely interference by Dubosc, conceives the bullet to have been discharged by his own son, and is so fixed in his belief that all his son's passionate protestations shake him not a whit in his conviction. The rest of the piece is occupied with the confusion arising out of the strange resemblance between the two men, which hurries Lesurques to a death that he only escapes by the treachery of one of Dubosc's comrades. The piece has this capital fault, which has been pointed out in another criticism—that it depends upon a confusion of which the audience is made aware from the very beginning. Setting this aside, the aim of the actor who plays the two parts of Dubosc and Lesurques should be to indicate that the two men are indeed different, but yet so alike that people knowing both might readily confound them even when life and death depended on their accuracy. Mr. Irving has gone too far in his desire to show the different natures of the two men, and has neglected too much the likeness which is requisite for stage purposes. His Lesurques is a man of spare build, whose courtesy and gentle character are, if anything, too plainly marked in his whole speech and conduct. His Dubosc is a burly ruffian of an English rather than a French type, whose hoarse, sullen voice and repulsive features are represented with a reality so great, and are so absolutely different from anything belonging to Lesurques, that the confusion between the two men becomes as inconceivable to the spectators of the play as it was to the judges of the actual trial. It is utterly impossible that the father of Lesurques could have taken the red-nosed scoundrel with down-drawn mouth, heavy jaw, broad shoulders, and villainous voice, who shoots him, for his own son, mild strike in words and gestures, even though he imagined him to be masquerading to conceal his purpose. Mr. Irving's rendering of the two characters and his alternate assumption of one and the other is a feat of undoubted skill; but it is both more and less than the play demands. For the rest, the actor seemed to us strangely to miss the force of certain pathetic passages in the part of Lesurques, while he needlessly exaggerated other passages in that of Dubosc. To see an injured woman stabbed by a ruffian can never be a pleasant sight even on the stage; and it would be well to shorten the struggle which ends in this stabbing between Dubosc and Jeanne. In the last act Mr. Irving represents Dubosc, who from a window in a cabaret is watching for the execution of Lesurques, as drunk. This may seem strange when one remembers that Dubosc makes himself known to his associates by drinking a bottle of brandy at a sitting. The bottle in the Lyceum representation is but poorly represented; but that is nothing, nor is it perhaps much that Mr. Irving should choose to make the villain drunk in the last scene. But we cannot think that a trick by which in this scene Mr. Irving gains much applause is either happily conceived or executed. The actor, in the climax of his triumph and drunkenness, drags himself with his back turned to the audience to a window at the back of the stage, whence he looks for the fatal tumble; and then, lying flat on his stomach, he kicks up his heels with delight. The action reminds one irresistibly of some lines which used to be sung in a burlesque by Mr. Robson:—"Old Joe a-kicking up hind and afore, And Columbine a-kicking up hind old Joe." We have said that the rest of the performance is not particularly good. Mr. Mead's performance of old Lesurques is, however, charged with feeling and dignity; and Miss Isabel Bateman's rendering of Jeanne wants nothing but better command of gesture to make it a performance worthy of much praise. Courriel is a part which should be well played—a highwayman who is at the same time a dandy. From the performance at the Lyceum it is quite possible to believe that Courriel was a highwayman, but it is absurd to imagine that he could be received in any private house, even in the days of the Directory. The management, by the way, might have done well to bring the costumes into far more strict accordance with the date of the play; and at the same time it may be observed that, as the price of the stalls has been for some time raised, a proportionate decrease in the offensive and, in the event of a panic, dangerous, narrowness between the rows might have been made with advantage.

L'Ami Fritz, which has been played by M. Febvre and a French company at the Gaiety, we criticized while it was being performed under more favourable conditions at the Théâtre Français. With the exception of M. Febvre's part, the only part well filled here was that of Suzel, played by Mlle. Lody, who, though far from equal to Mlle. Reichenberg, has much merit. The performances of Sheridan Knowles's *Love Chase* at the Haymarket have given Mr. Chippendale an occasion for exhibiting his excellent style in a suitable part; and have added to other proofs which Mr. Harold Kyrle has given of his talent and industry. To the comparatively small part of Truworth Mr. Kyrle, by his good diction and gesture, gave an importance which one might not think it capable

of assuming. Mrs. Chippendale was amusing as Widow Green. Miss Amy Sedgwick played Constance, and was appallingly lively in the scene from which Lady Gay Spanker's speech in praise of hunting in *London Assurance* would seem to be taken.

THE DERBY.

TWO events occurred during the Second Spring Meeting at Newmarket to break the monotony of one of the quietest weeks of the season. The ill-advised alteration of racing law which reduced the minimum weight in handicaps from 5 st. 7 lbs. to 4 st. 7 lbs. was repealed by a decisive vote of the Jockey Club; and a new candidate for Derby honours was discovered in Altyre, a small, but muscular and compactly framed, son of the famous Blair Athol. The meeting of the Jockey Club was well and influentially attended; and though the authors of the new rule and their nine supporters stuck to their opinions, despite the storm of opposition they had excited on all sides, twenty-one adverse votes effectually settled the fate of the obnoxious law, which had happily not lasted long enough to be put into force. As a general rule, these sudden changes of mind on the part of a legislative body are much to be deprecated. A Parliament which passed laws one Session and repealed them the next would soon cease to command respect; and it is an accepted principle that, when once a measure has been fairly discussed and has received the sanction of the Legislature, a fair trial should be given to it. The same rule holds good, or ought to hold good, as regards the Parliament of the Turf, which, in its small way, watches over the interests of racing and commands the confidence of racing men. It would be intolerable if laws were to be perpetually made, unmade, and remade, just according to the caprice of the moment or the accidental presence or absence of members of a particular way of thinking. Neither the racing nor any other community would long submit to a tribunal which did not know its own mind for two weeks together. In the present instance, however, the emergency was so pressing and the grievance so flagrant, that the real strength of the Jockey Club, in numbers as well as in influence, was justified in asserting itself. Besides, it was the promoters of the objectionable innovation who were the first to break through the wholesome rule to which we have referred. The new code of Racing Law, on which a carefully selected Committee had been engaged for many months, and which had received the deliberate sanction of the entire Jockey Club, had actually been in force only a few weeks when an attack was made on one of its most vital enactments and a chance victory snatched. In securing the prompt reversal of this rash and ill-judged proceeding, the majority of the Jockey Club have simply declined to upset the work of their Committee before its merits have been fairly tried. In this they would have been fully justified, even if the recent change had been of the most harmless character; but its manifest tendency to revive one of the worst abuses of racing furnished an additional argument in favour of the prompt action they have taken.

The appearance of Altyre in the front rank of the Derby favourites was quite unlooked for; and in the present dearth of first-class English horses, the discovery of anything good enough to be a rival to the all-conquering foreigners was decidedly welcome. As a two-year-old Altyre did nothing deserving consideration. He ran twice, and on both occasions failed to get anywhere near the front. So little was thought of him after these inglorious performances, that his owner had almost resolved to turn him out of training. The intention, however, was not carried into effect; and, another chance being given to Altyre, he availed himself of it to retrieve his character. At the recent Second Spring Meeting at Newmarket he won all his engagements in brilliant style; the first over the Ditch mile, the second over the Cesarewitch course, and the third over the Kowley mile, the judge's verdicts being eight lengths, fifteen lengths, and six lengths respectively. The horse, in fact, won his three races without being extended, and it was this rather than the quality of his antagonists—the best of whom were Zee, First Spring, and Plaisance—that created so general an impression in his favour. It is not every day that a horse comes out who can both go fast and stay, and it was not Altyre's fault that his victories were gained in moderate company. He won all his races with consummate ease, and no horse could do more. A more reasonable objection to Altyre was his diminutive size, and it was considered that when it came to racing, horses like Chamant and Pellegrino would be sure to outstride him. For all that, and especially as the field for the Derby promised to be neither very large nor of very exceptional merit, Altyre's chance of obtaining a place was held in high estimation, and he was deservedly supported with great spirit for the inferior honours of the great Epsom race. In other respects nothing happened at home during the Second Spring week to throw light on the Derby, while abroad the defeat of Fontainebleau by Jongleur showed that Chamant would be rid of one of his most formidable antagonists. M. Lupin's horse disposed of Verneuil so easily in the French Two Thousand that, if all had gone well and he had taken a part in the English Derby, he must have stood a fair chance against Chamant; but, unfortunately, he went amiss, and was coughing badly when his owner spiritedly, but not very prudently, brought him out to run against Jongleur. Strachino also showed such indifferent form in the Two Thousand that there could be little hope for him at Epsom; and thus the foreign division, which threatened to be

exceptionally strong this year, dwindled down at last to Chamant alone, who, however, was a host in himself. From the day of the Two Thousand almost up to the eve of the Derby the position of Chamant grew stronger and stronger, and the conviction was confirmed that none of the horses that finished behind him at Newmarket had a chance of reversing positions at Epsom. Brown Prince and Silvio might get places as they got them before, or at any rate might occupy forward positions; but winning, in the face of Chamant's great public performances, seemed out of the question. The danger to the French horse, if danger there was, must be looked for outside the Two Thousand field. Plunger would have had adherents had it not been so evident that all had not gone well with him during the winter; and both Pellegrino and Rob Roy had hosts of friends. The former should have improved considerably since last year to be on equal terms with Chamant, who in the Middle Park Plate gave him 6 lbs. and a head beating; and the inglorious display a month ago of his stable companion Morier caused his pretensions to be regarded with some suspicion. Still the Derby is an uncertain race, and Tattenham Corner is often fatal to the best horse, and so Pellegrino maintained his position pretty well. Rob Roy won his two engagements as a two-year-old with great ease, and of his speed there could be no doubt. The question was, could he stay as well as go fast? and a favourable answer to that had been taken on credit. He declined his rich autumn engagements last year—an event so rare in these mercenary days as to be to a certain extent suspicious; but, on the other hand, he enjoyed the most implicit confidence of his owner and trainer, who fully believed him to be the best horse of his year. As for the remainder of the probable starters, such as Grey Friar, Touchet, and Jagellon, their chances were hardly thought deserving of serious consideration.

At the beginning of the present week, therefore, everything looked well for the adherents to public form. Verneuil's close race with Jongleur for the French Derby could not fail to be gratifying to the friends of Chamant; for Jongleur has never been beaten, and has won all his races in good company. The very next day, however, there was a terrible revolution in the state of affairs. The rumour spread that Chamant had met with some accident; and an accident three days before the Derby can hardly fail to be an irreparable disaster. The horse at once retired from the proud position he had so long held as first favourite, and for a time there seemed a doubt whether he would appear at Epsom at all. Subsequently there was a reaction; but that something had happened there was no doubt. It was no idle *canard* about an accident, and the arrival of Chamant at Epsom failed to revive the waning confidence of his friends. At the very same moment came the news that Pellegrino was scratched; and thus the first, second, and third in the Middle Park Plate, representing the best form of the year, were virtually *hors de combat* for the Derby. Such a succession of accidents in the foremost ranks of the three-year-olds has rarely if ever occurred; but fate, which has dealt so unkindly with Chamant, Pellegrino, Plunger, and Fontainebleau, was more merciful to Silvio, Touchet, Brown Prince, and others of the second-class division. They came to the post fit and well enough, and to them and such as them the Derby was left.

The throng was as great as ever in the Paddock, and of course Chamant, who was one of the early arrivals, was the great object of curiosity. Though looking in splendid condition, the son of Mortemer was obviously lame; and, indeed, those about him made no secret of the fact, and it was probably more to satisfy the public than from any belief in his capability to win that he was brought to Epsom. His lameness was still more apparent when he cantered; and, after allowing the public to see what was really the matter with him, it would have been only fair to a gallant horse to have spared him an unavoidable defeat. Altyre and Silvio were both liked, and the latter was considered well suited to the course; while the absence of Rob Roy from the Paddock was generally regretted. Brown Prince looked clumsy and deficient in quality, and Plunger, though dexterously patched up for the occasion, was sadly deficient in muscle, and his trainer had evidently been afraid to give him real hard work. In the preliminary canter Rob Roy and Altyre attracted most attention, both going freely and well, while Chamant went very stiffly, and as if in pain. Though the field numbered seventeen, a more commonplace lot has seldom been seen, more than half of them being hardly up to average handicap form. Happily, they gave no trouble at the post, and were despatched at the very first attempt. The running was made by an extreme outsider, Glen Arthur, who went away with a good lead, maintained it to within fifty yards of the judge's chair, and only succumbed at last, after a well-fought and well-riden finish, by half a length. In a Derby of mediocrities it was fitting that an unknown and uncared-for outsider should well nigh snatch away the prize. For the last quarter of a mile there was a good race between Rob Roy, Silvio, and Glen Arthur, and Lord Falmouth's horse, running with great gameness, just got the best of the struggle; and, considering that Glen Arthur had made the whole of the running, it was creditable to him to make so good a fight at the finish. Rob Roy made up a great deal of lost ground in the last two hundred yards, and was rapidly gaining on the leaders at every stride. It is said that he experienced some disappointment at Tattenham Corner, where every year some of the Derby field have their hopes extinguished, and that he was nearly knocked down by Thunderstone. Certainly the gigantic son of Thunderbolt was rolling about from distress more than a quarter of a mile from home, and it is

easy to understand that there was great anxiety to avoid coming into collision with him. Based at this critical point, Rob Roy lost an advantage which he was never able to recover; though in any case he would probably have had to be content with second honours. As it was, he just succeeded in getting the place for which he had been so heavily supported, though only by a head from Rhidorroch, a horse of plating form, whose forward position in the Derby speaks volumes for the inferior quality of the field. Altyre was fifth and Brown Prince sixth, while Chamant, who had run as well as a horse lame all round, could be expected to do, followed some way behind.

The victory of Silvio was well received, and Lord Falmouth must be considered fortunate in having won two Derbies with second-class horses. Had Chamant and Pontainebleau kept well, or had Jongleur been entered for the race, the English horses would most assuredly have played only a secondary part in the Derby. Rob Roy, it is clear, has been over-estimated, for he was thought good enough to beat first-class form, yet in the event he could not vanquish a horse to whom, in the Two Thousand, Chamant gave a stone beating. Too much also, as is often the case, was made of Altyre's handicap performances; and Brown Prince, as might have been anticipated from his appearance, found the ups and downs of Epsom a very different thing from the flat at Newmarket. Touchet, also, who in the early spring was thought good enough to win in any company, proved himself a horse of very ordinary stamp; but the forward position held by Glen Arthur suggests the question whether Hidalgo have finished had he also not shared the fate of Chamant and Pellegrino, and fallen lame a few days before the Derby. On paper, Hidalgo, who is far superior to his stable companion Glen Arthur, ought to have beaten Silvio; yet he, too, is one of those big horses who seldom manage to get down the hill at Epsom and round Tattenham Corner. There will be some natural rejoicing that the Derby of 1877 has fallen to an English horse; but there is certainly little to boast of in the victory. Fortune was against the French horses this year, and favoured the very inferior representatives of our own racing stock. Silvio has won the Derby; but we may expect to see the Derby running reversed before the end of the season, and Lord Falmouth's horse deposed from the high position he now occupies. Perhaps the unexpected triumph of England in the great three-year-old race of the season will allay some of the feelings of jealousy that have been excited against foreign-bred horses on account of their too frequent successes on English racecourses.

REVIEWS.

BOOKS ON TURKEY.*

THE supply of books about Turkey and the Turks continues in full flow, and, as a rule, it must be said, to the credit of the writers, that each in his or her special way has some peculiar claim to write. Mr. Freeman, for example, who knows as much history as the human mind is capable of knowing, writes of the Turks with that paramount claim on the reader's attention which is given by an exhaustive knowledge of facts, wide bases of comparison and reflection, a practised style, and irrepressible enthusiasm. Miss Muir-Mackenzie and Miss Irby are well known as ladies who have not only travelled in the Slavonic provinces of Turkey, but have lived and worked in them, who have given their strength and their lives in the cause of the poor and the oppressed, and who could speak above all of Bosnia with accurate and intimate personal knowledge. Mr. Salusbury is a very young gentleman who served for two months in the Servian army, and who to the charms of an infantine style adds the advantage of vivid reminiscences of personal adventure. Then, on the other hand, while all these writers come before the public on the ground of knowledge, and base what they have to say on facts, and ask only to be heard so far as they are giving a true account of historical events, there is, it must be remembered, a large section of the public which does not care in the slightest degree for facts about Turkey, but views the whole Eastern question in the light of a favourite theory. An adequate provision for their wants has been made by Lord Robert Montagu, who has reprinted copious extracts from the Blue-books, using whole lines of italics at discretion, ingeniously printing, when he pleases, England for Turkey and Ireland for Bulgaria, freely interspersing quotations from Jeremiah and Habakkuk, and ultimately arriving at the conclusion that the great thing for Europe is to have a general federation of States, with the Pope as sole and universal chief. He admits that Lord Derby is not at all the sort of person who can be trusted to work out this theory in practice. But that does not spoil the

theory; and when we get into the domain of pure theory, the wilder a theory is, the more exciting and successful it appears. Lord Robert Montagu has done all that could be done by an utter incoherence of thought, an unrestrained liberty of assumption, and a maudering style, to give a theoretical work all the attractions that can delight and content its readers.

It is impossible that Mr. Freeman should write on any historical subject without teaching much and enforcing much. In telling the story of the Ottoman Power in Europe, he not only gives a striking and clear narrative, dwelling on what is really important and omitting what is subsidiary and hard to remember, but he establishes the principles of a train of reasoning, and lays firm foundations for many of his conclusions. He answers with more precision than any preceding writer the two elementary questions on the right solution of which all proper treatment of European Turkey depends. These questions are:—Why does European Turkey differ entirely from all other parts of Europe? and in what sense are the Christians in Turkey to be called better than their present masters? The answer to the first question is, that European Turkey is the only part of Europe where the conquering race has always remained entirely separated from the conquered; and that the conquering race had this peculiarity, that it was endowed with a total incapacity for imbibing those ideas of government which in the rest of Europe are called good and just. Partly through the adoption of Mahometanism, and partly through the retention of the habits, customs, and traditions of a predatory horde, the Turkish ruler has been, and is to this day, divided from his Christian subjects by a deep and impassable gulf. His Christian subject is better than he is in this sense. His faults may be as numerous as the grins of dust in a beam of light, but, because he is Christian, he is accessible to those influences which have made Europe what it is. Christianity does not make him good, but it makes it possible that he should be better. It is one of the favourite positions of Mr. Freeman, on which he has been dwelling for a quarter of a century, that when we speak of Christianity we really mean a body of religious doctrine *plus* the civilization of the ancient world. This civilization passed from Greece to Rome, and from Rome to modern Europe. Christianity assimilated it, and Mahometanism rejected it. Where Mahometanism was the conquering power and Christianity the conquered, the Mahometan, with few exceptions, and the Mahometan Turk with no exceptions, kept down with a relentless hand the germs of a civilization which seems something not only alien but accursed. In the decadence of the Turkish power this tyranny has assumed the worst possible form it could present—the tyranny of a clique of ignorant, merciless adventurers, ruling all the provinces from the palace of the Sultan. The rule of the Turk is thus worse in its decay than it was in its days of strength and prosperity. This is the main thesis that Mr. Freeman has set himself to prove, and if any one does not consider it proved, Mr. Freeman is ready to launch the worst kind of historical thunderbolts on his head. To the mass of Englishmen, however, as they are at the moment when this volume appears, this thesis may be considered as proved. Mr. Freeman only gives a finishing tap to a nail which was already driven well home. England has resolved that it will have nothing more to do with the Turk as an ally and a friend.

But when we look into the details of Mr. Freeman's book we find that it is possible for historians to be a little unjust, and not a little despotic. Mr. Freeman turns his unparalleled knowledge of history into an engine of tyranny. He is a dictatorial writer; he feels passionately and he writes passionately. To his historical mind all persons of all centuries are alive. He hates a dead Turk as much as ordinary men hate a living cockroach. He tramples the creature under his awful heel, and then surveys with a fine frenzy the quivering remains of his victim. The dead, however, cannot feel, and to Turks of the sixteenth century it cannot make much difference whether Mr. Freeman abuses them or not. But living men do not like being treated like cockroaches, and Mr. Freeman has a peculiar way of stamping on them historically which is very trying. He can always dig up some very bad person out of history, and say he is exactly like the person he is abusing. This is a very unfair use of history. We read, for example, of Hobart Pasha, whom Mr. Freeman bitterly detests, that "the shame of Robert of St. Albans has its like in the shame of Hobart." This is exasperating. There may be possibly ten people in England besides Mr. Freeman who have heard of Robert of St. Albans; but the vast majority of readers would hear the name for the first time, and would suppose that it was only their ignorance that prevented their appreciating a close historical parallel which condemned Admiral Hobart to clear and merited infamy. Fortunately Mr. Freeman condescends to explain to the ignorant who this Robert was; and it appears that Robert was "a knight of the Temple who betrayed his order, his country, and his faith, who took service under Saladin, and mocked the last agonies of the Christians when Jerusalem was taken." It is sheer historical tyranny to say that the shame of Hobart is like the shame of Robert. Excepting that both have served under a Mahometan prince, there is not the slightest point of resemblance between them. Admiral Hobart has not betrayed his order, for he had none to betray; nor his country, for he received the thanks of his Government; nor his faith, for he remains a Christian, and he has never mocked the last agonies of any one. There is, indeed, far too much of this boot-heel and cockroach style throughout Mr. Freeman's volume. Lord Derby is one of the victims. Herod, the murderer of John the Baptist, is selected as his historical parallel. The precise point of the parallel appears to be that, just as Herod considered himself

* *The Ottoman Power in Europe: its Nature, its Growth, and its Decline.* By Edward A. Freeman, D.C.L. London: Macmillan & Co. 1877.

bound by his oath to let the daughter of Herodias have the Baptist's head, so Lord Derby considered himself bound by the Treaty of Paris not to let English men-of-war carry off Cretan insurgents. There is no limit to invective of this kind. Every one of whom the historian disapproves can be said to be like some known or unknown bad person in history. This is a painful abuse of historical knowledge. Statesmen have to do with a particular existing set of facts, and not with some other set of facts in a remote age of history which were in some respects rather like them. To treat the two sets of facts as identical is dangerous to a nation and unfair to individuals, and this is an error into which Mr. Freeman appears to us to be not unfrequently falling.

The work of Miss Muir-Mackenzie and Miss Irby is for the most part a reproduction of the volumes published by them some time ago, in which they described their travels in the North-West of European Turkey. But Miss Irby has prefaced this new edition with three new chapters on Bosnia. She was in Bosnia in 1865, at the time of the outbreak of the insurrection, and she has continued there since then her work of charity. She and her friend had established a girls' school at Serajewo, and her primary object was to visit this establishment. But the commencement of troubles decided her to remove her scholars to a place of safety, and, not without difficulty, they were transported to Austria. On the hideous tale of wrong and misery revealed in Miss Irby's pages, the frightful daily and hourly cruelty of the Turks and of the Mussulman Serbs towards the unhappy creatures who lay at their mercy, Mr. Gladstone dwells in his preface, and he is fully entitled to dwell. He desires, above all things, that Turkish rule in Bosnia should be done away with, and there is no meaning in such words as humanity, mercy, justice, and pity, if his wish is not shared by all who live in comfort and peace under the shelter of a happy and free country. It is most useful that the history of Bosnia should be known in England, and that Englishmen should really understand what it was that made the Bosnians revolt, and impelled 200,000 persons to cross the Save and live on a daily penny a head in the territory of Austria. Miss Irby writes very soberly and with an anxious desire not to exaggerate or make up a sensational picture. She only relates what she has seen, or what has been stated to her by persons whom she has known personally and on whose good faith she can rely. But it is one thing to pity the Bosnians, and another thing to say what is to be done for them. Near the Black Mountain the insurrection has a sort of chance, as the insurgents are protected by the difficulties of the country, and yet are able to find spots among the hills where they can grow crops sufficient to keep them alive. Elsewhere the insurrection only took the form of a flight. The Turks and the Mussulman residents laid waste the Christian villages, and the only question was whether the inhabitants could get away into Austrian territory. Unless Austria virtually annexes Bosnia, there is only one prospect before the orthodox Bosnians, and that is to die out of Bosnia altogether. That Austria does not wish to annex Bosnia is certain. The political disadvantages to her of annexation are immense, and she has done all she can to discourage the immigration of the Bosnians, short of absolutely forbidding it. Humanity prompts her to allow the fugitives to cross the Save, and then policy prompts her to bid them to live on a penny a day. It is extremely hard for Austria to know what to do; for, terrible as are the sufferings of the Bosnians, it is making a great demand on Austria that, merely to redress misrule for which she is not in the slightest degree responsible, she should be called on to charge herself with the government of a ruffianly Mahometan population, and by an enlargement of her territory raise questions with her neighbours which she prudently seeks above all things to avoid raising.

From the impassioned utterances of Mr. Freeman and the harrowing pictures of Miss Irby it is a relief to turn to the narrative of Mr. Salusbury, in the sense that small things please the mind fatigued with great things. Mr. Salusbury is, as he informs us in his preface, a young gentleman of twenty-one years of age, and we learn from his title-page that he is a lieutenant in the First Royal Cheshire Light Infantry. He opens his story by naively telling us that on Saturday, the 15th of August last, an "idea entered his head" that, having nothing particular to do, he might as well go to Serbia. The next day he began to put his plan into execution by saying good-by to his friends, and by making inquiries as to the best way of reaching Vienna. On Wednesday morning an anxiously expected letter was put under his door, and he felt able to start at once. He dressed with a rapidity which astonished his family, said good-by to his father, caught the train, alighted at Euston Station, and drove to his club. He feels it right that the public should know everything that he can possibly tell it, and from one end to the other of his volume there is not an omission of which we can complain. A complete inventory is given of the contents of his portmanteau, and his literary stock in hand is carefully recorded as having consisted of a volume of Murray and one novel. He landed at Rotterdam, where the river bank reminded him of Cheyne Walk, Chelsea. When he got into the Dutch train he began by noting down the name of every station, and the exact time of arrival and departure; but it occurred to him that, if he went on in this way, he would fill his notebook before he even saw Serbia; and so he stopped, and merely records that the conversation of his Dutch fellow-travellers reminded him of the monkey-house at the Zoological Gardens. At last he got to Belgrade, and after some complications with the authorities, he found a foreign legion, or,

rather, a legion with foreign officers, into which he was admitted. He formed from the outset but a poor opinion of the Serbian soldiers, although the officers were very much to his taste. Of course, he too had to be an officer, "not that," in his frank language, "he cared two straws whether he was a colonel or a sub-lieutenant in such a rabble," but merely as a concession to the exigencies of the situation. Subsequently he went to the camp at Deligrad, and at last was appointed aide-de-camp to General Dochtoureff, who promised him that, if he would accept the appointment, he should go under fire, and as "his sole desire was to go into action," he closed with the offer. Early in October Mr. Salusbury began his new duties. And at last the wish so near to his heart was realized, and a shell burst only twenty yards from him. He wished to dismount and secure a piece of this shell, which seemed to belong especially to him, but his general was more prudent, and made him ride on. In almost every page thenceforward we have warm tributes to the gallantry of the Russian officers, and loud complaints of the cowardice of the Serbian soldiers. Going with his general to the Timok valley, Mr. Salusbury had the pleasure of taking part in a real engagement. The Serbians on the 18th of October attacked the Turks, and the attack failed. On the 20th the Turks attacked, their attack succeeded, and the war was at an end, and Mr. Salusbury returned home with a gold medal and the gold cross of Takova—modest honours, but all that Prince Milan had to give, and as really deserved as any honours could be. With his usual punctiliousness of detail, Mr. Salusbury notes down every incident of his homeward journey, including a description of the papers he bought between London and Chester, the porters at the Chester station, the cab that conveyed him to his family, and, lastly, the "avalanche of loving relatives who in the assault they made upon me succeeded in putting *hors de combat* a remarkably good hat." It is this simplicity of narration, this accuracy in trifling descriptions, the frankness with which all that the writer saw and felt and did is chronicled, that give a value to the book. It is so evidently all real, and puts before us with remarkable vividness the small daily history of a disastrous campaign.

Of Lord Robert Montagu's book it is unnecessary to say much, for it lies altogether outside the range of criticism. When he wants facts he seeks them in the compositions of Mr. Urquhart; when he wants arguments he seeks them in quotations from the Vulgate. Hatred of Russia and contempt for Lord Derby appear to be his most prominent feelings. But, as his hatred for Russia is almost exclusively theological, and his contempt for Lord Derby reveals itself by interspersing italics through extracts from Blue-books, there is nothing to be gained from his volume except by those who share his theological passions, and think arguments from italicized quotations convincing. It is probable that very few ordinary Englishmen will read a line of what he has written. To some, however, it may be a matter of not quite idle curiosity to know what are the views on the Eastern question of that Ultramontane world of which we hear so much and know so little; and they may be cheered in a wearisome task by finding continually recalled to their recollection that, after all, Lord Derby did a good deal to keep the country clear from a policy in harmony with views opposed to all the sentiments, traditions, principles, and interests of England.

THOMAS DE QUINCEY.*

THERE are few modern writers whose life, if adequately told, I would promise to be of more interest than De Quincey's. With the earlier part of that life all readers are, of course, more or less familiar through the *Confessions*. Even in regard to that part of it we should be thankful for the evidence of an independent witness; for we cannot, without such evidence, assume that the facts were not considerably distorted by the dreamy imagination of the writer. During the later period, however, of a long life, De Quincey disappeared to a great extent from society. He led a kind of anonymous and Bohemian existence, and we hear of him only at intervals through the incidental references of various persons with whom he came into accidental contact. Literary people were naturally anxious to catch sight of a man who, whatever may be our estimate of his merits, had certainly added to English literature some writings of unique excellence in their own department. Here and there in contemporary memoirs we have accounts of his appearance and habits which do more to stimulate than satisfy our curiosity. Professor Masson, for example, is brought forward in these volumes to testify to his impressions. He says that nothing was easier than to get De Quincey to dinner, if you knew the way. The way was to send a cab for him, with some one in it to collar him and bring him by authority. It seems, however, that, easy as the operation may have been, it was not often carried out. He was brought by a "strong determined man" to a dinner at which Professor Masson saw him for the first time, and he talked, as we are told, admirably. But Professor Masson merely adds that he saw him "once or twice again," and on the last occasion did not venture to address him. From such reports and a few others of a similar kind little is to be gathered; and the prominence given to them suggests the scantiness of the materials.

De Quincey, however, has fortunately fallen into the hands of a

* *Thomas de Quincey: his Life and Writings.* By H. A. Fane. London: Hogg & Co. 1877.

biographer who possesses the necessary qualification of a somewhat undiscriminating zeal. Mr. Page, who is favourably known as the author of a *Life of Hawthorne*, has done his best to save all available knowledge of his hero from the rapidly gathering mists of oblivion. He has been supplied with much information by the surviving members of De Quincey's family. A good many characteristic letters, various papers which throw light upon the later period of the life, and the personal reminiscences of some acquaintances in later years, enable him to put together a tolerably consecutive and satisfactory biography. In the earlier period Mr. Page of course relies chiefly upon De Quincey's own writing, and a great part of the first volume rests substantially upon the autobiographical writings. No one can be sorry to read again much of De Quincey's own narrative; but we are not very clear how far Mr. Page is justified in saying that his book will show how "correct and conscientious" his hero was "even in minor details." We have some difficulty in discovering to what extent Mr. Page has relied simply upon De Quincey's own statements, or where they are corroborated by independent proof. A few more references would have made this plainer; but nothing of importance seems to turn upon it. We are content to assume that the account in the *Confessions* and autobiographic sketches was substantially correct, and probably more correct than might have been inferred from a simple reading of the original.

The subsequent history of his life may be briefly indicated. After leaving Oxford De Quincey was attracted to the Lakes, chiefly, it would seem, by his admiration for Wordsworth, in whose family he resided for some time. In 1809 he took a cottage at Grasmere, and thus became one of the fixed stars in the Lake constellation. His greatest friend seems to have been Professor Wilson, to whom he was attracted, as is usually the case, by contrast as well as by certain affinities of character. Wordsworth gradually cooled towards him, a fact which is hardly surprising when we compare the two men. From 1804 to 1812 he had been, as he tells us, a dilettante opium-eater, but at that period he was seduced into the excesses which have become historical. His marriage to the daughter of a Westmoreland statesman followed a temporary reform in 1816. The marriage appears to have been a happy one; and, indeed, it is pleasant to observe that, whatever may have been De Quincey's weakness, his domestic affections were throughout pure and vigorous. Marriage, however, brought new troubles of a pecuniary kind, and plunged him into troubles from which he again sought relief in opium. He again reformed, and in 1819 made the attempt to edit a country newspaper, an employment for which he may be said to have been expensively unfit. An unlucky critic, frequently denounced by Mr. Page, is rebuffed, amongst other things, for denying that De Quincey could have equalled Swift's assault upon Wood's Halfpence. Mr. Page, however, is fain to confess that his hero could never have made a successful newspaper editor—a proposition which seems to explain the critic's meaning, and which at any rate nobody is likely to dispute. In 1821 De Quincey went to London in search of literary employment, and at this period his pecuniary troubles seem to have culminated. He was occasionally in hiding from his creditors. The year 1821, however, saw the establishment of his fame as an author, the first instalment of the *Confessions* having appeared in October of that year. For some time afterwards he seems to have oscillated between the Lakes and London, and in 1828 he settled at Edinburgh. Though some years were passed after a wandering and Bohemian fashion, with occasional excursions to Glasgow, Edinburgh and the neighbouring village of Lasswade were his main habitat during the rest of his life. Heavy domestic blows fell upon him not long after his migration to Scotland. In 1833 he lost his youngest son; in 1835 his eldest son, a lad of unusual promise; and in 1837 his wife. After this last blow he again fell into opium excesses, though from 1844 he was comparatively free from the bondage. His daughters undertook the charge of his pecuniary affairs, and during the later years of his life he seems to have suffered no anxiety upon that score. He died at the end of 1859 in his seventy-fifth year.

Mr. Page, as we have said, is by no means free from the ordinary disease of biographers. He takes De Quincey at his own valuation as a philosophical thinker. He admires the humour which to many readers appears so strained and wearisome, and, in short, sees scarcely any limits to the literary merits of his author. Upon such matters we have not the space or desire for controversy. Every one must judge for himself of De Quincey's literary merits; and, if Mr. Page's critical remarks are unlikely to have much weight, the perusal of his book may at least induce some readers to refresh their memory of the original. But, whatever we may think of the writer, we willingly admit that the record of a rather aimless and unsatisfactory life is calculated in some respects to raise our estimate of the man.

That De Quincey was in some sense a Bohemian is undeniable; but there are Bohemians and Bohemians. The word may be taken to imply a complete disregard of the duties which a man owes to society, to his family, or to himself. In De Quincey's case we may say that it implies chiefly a want of fixed purpose and an utter incapacity for the business relations of life. No man could be more childishly helpless in all questions of pounds, shillings, and pence. He was capable of borrowing half-a-crown from a friend when he had a fifty-pound note in his pocket. The consciousness of his liabilities oppressed his spirits, and yet he could never nerve himself to have his affairs put in order, though, we are assured, it might have been easily done. His other habits were equally amazing to

the methodic housekeeping mind. His books and papers accumulated in chaotic masses upon the floors of the rooms which he occupied, until no space was left for sitting or writing; and an accidental spark might have caused a fatal conflagration. He knew, or supposed that he knew, where to find what he wanted, and forbade any attempts to reduce the chaos to order. When crowded out by his own accumulations, his only remedy was to desert the room. It appears that he was paying at the same time for more than one set of lodgings, which had thus been occupied by accumulating masses of literary lumber. He would take about with him boxes full of papers intelligible to himself alone, leave them casually at an inn or a shop, and then hopelessly forget the locality of his deposit. It is, however, pleasant to know that he did not, amongst other things, forget to pay his bills. He judiciously provided against such oblivion by trusting his money matters to his wife, and afterwards to his daughters. His reckless generosity, indeed, must have made their task sufficiently difficult. Early in life he gave 300*l.*, and offered 500*l.*, to Coleridge as a substantial testimony of respect. He often pushed charity in later years to the verge of silliness, and seems to have emptied his pockets to beggars pretty much at random. Mr. Page is of opinion that this virtue or weakness will secure our forgiveness for the heaviest sin of commission with which he is charged. He violated private confidence by publishing accounts of Coleridge and Wordsworth. To excuse him on the ground of poverty caused by over-generosity does not appear to us to be exactly judicious. The excuse virtually admits that his careless mode of life had to some extent injured the delicate sensitiveness in such matters which a gentleman ought to preserve.

More, however, may be said for him on another score. Bohemianism generally lowers a man's sense of family obligations. De Quincey seems throughout life to have been as good a husband and father as his eccentricities permitted. He was warmly attached to his children, took much pains in their education, and remained on the most affectionate terms with them to the end of his life. One of them, Mrs. Baird Smith, has contributed some very interesting recollections. The self-indulgent weakness produced, or indicated, by his opium-eating did not degenerate into the worse forms of silliness. He was thoroughly amiable and courteous to the last; fond of children, and in many ways childlike in his tastes. Mr. Page seems anxious to prove that he also took an enlightened interest in public affairs. The proofs are not very convincing. He read the papers carefully; he was much excited by the Indian Mutiny, when his daughter and her husband, Colonel Baird Smith, were in the thick of it; and he carefully studied police-reports and the accounts of celebrated murder cases, as indeed might be expected from the author of the familiar essay; but all this is hardly indicative of profound interest in the business of the world. De Quincey was obviously not qualified to be more than a dreamy spectator of the active drama of life. Dreamers, doubtless, have their value, and there is no lack of noisy and intrusive actors; but, for good or bad, De Quincey was one of the dreamers. Mr. Page is anxious to insist upon his sympathy with human suffering, in order to repel the charge of simple epicureanism, and no one can deny that De Quincey was capable of much deep and tender feeling. The story of Anne in the *Confessions* is, as Mr. Page says, a proof of his occasional pathetic power. But the limitations are equally obvious. Mr. Page is indignant at a comparison between De Quincey and Rousseau. It is quite true that Rousseau accuses himself of far worse immorality than any which can be laid to De Quincey's charge, and was in other ways very unlike the Opium-eater. One difference is, however, that Rousseau's sympathy with human sufferings and the expression of his feelings shook the whole fabric of European society; whereas De Quincey's sympathy led only to the composition of a few pages of most exquisite English. His kindness of nature is no more doubtful than the acuteness of his intellect; but the paralysis of will under which he suffered prevented him from making any serious contributions to philosophy, or stirring the passions which demand something stronger than a merely æsthetic gratification.

Mr. Page has collected enough amusing anecdotes of De Quincey in this book to make us wish for more. Such, for example, as a quaint story of his consuming the heel-taps left in a number of medicine-bottles in a house where he was staying; and then apologizing to his host, in a spasm of remorse, for this supposed breach of hospitality. His oddities were mostly inoffensive, though they must have been grievous enough at times to printers and others brought into business connexion with him. Most readers would have been glad of some fragments of the conversation for which he had so high a reputation. But no records have been preserved; and probably they would have been disappointing. His talk seems to have resembled that of Coleridge, though he did not, like Coleridge, monopolize the attention of his company. But of such conversation, discursive rather than epigrammatic, and remarkable for fullness of knowledge more than for vigour, it is impossible to give any adequate report. It becomes tedious on paper, and in De Quincey's case must have resembled at best a diluted edition of the *Confessions*. The letters, of which not many have been preserved, are interesting; and even those of his early youth show the characteristics of the familiar style, whose merits and defects we need not discuss in this place.

THE CRADLE OF THE BLUE NILE.*

MR. DE COSSON tells us that he started on his tour with the intention of shooting along the banks of the Atbara, but that he was induced to change his plan and visit Abyssinia, its capital Adowa, Gondar, Lake Tzana, and Khartoum. We are not sorry for this deviation; and if the original intentions of the author still formed part of his programme, it is quite clear that he thought more of men and less of animals. Sporting incidents, in fact, form but a small portion of these two volumes. The *Old Shikarry* or Mr. Parker Gilmore, we may be quite sure, would have made a much larger bag in the same time, and would have told us much more about stalking by day and alarms by night. Viewed in this light only, the expedition must be accounted a failure. Some guinea-fowl, sand-grouse, ducks, partridges, and hares were shot; but the cartridges were left behind, and the ammunition failed when game was most abundant, while the author and his friends seem to have shot for the pot. There was certainly an adventure or two with leopards, which might have ended awkwardly; and at Lake Tzana they stalked hippopotami, wading into the water breast-high after these huge and dangerous beasts. This mode of attack, it appears, is locally orthodox, and is practised by a native tribe of Witos; but it strikes us as hazardous and unsportsmanlike, and it certainly was not conspicuous for its success. The unwieldy animals dived, and often carried off several explosive bullets; and exposure to wet brought on ague and ophthalmia. Other serious inconveniences were felt. Mr. De Cosson suffered from sores on the body, from jungle-fever, from a plague of vermin, and from the extremes of heat and cold. Food was bad and scarce, and the native fashion of devouring large hunks of raw meat, seasoned with salt and pepper, was not to be easily learnt. Mr. De Cosson takes occasion to notice Bruce's well-known story of the custom of cutting steaks from the live animals, and evidently either thinks that the great traveller mistook an exceptional incident for a regular practice, or that the habit, if ever it existed, is obsolete. But, if the travellers failed in the ostensible and primary object of their travels, they, speaking through Mr. De Cosson, give us ample compensation in the shape of notices of social customs and climate, and descriptions of country, from the high ranges of the Abyssinian mountains to the wide expanse of the Soudan. These are worth whole heratombs of slender gazelles and bulky river-horses. Mr. De Cosson has, in fact, produced a lively, accurate, and graphic account of a journey of five months in a country to which the campaign of 1868 imparted a new interest, and we can do justice to the author in no other way than by presenting our readers with the following outline of his route.

He landed at the coral island of Mas-awah, after the usual stifling journey down the Red Sea, and, though furnished with letters from the Egyptian authorities, found serious difficulty in getting forward. The local officials were prodigal of excuses and bent on delay, and there was an evident desire that the mysteries of the slave-trade should not be disclosed to the inquisitive foreigners. However, the travellers got off at last, provided with vicious mules, intractable camels, and lazy porters, and they climbed over steep passes up to the highlands of Abyssinia. Here, though the sun was hot, the air was pure and bracing, and Adowa was reached about the middle of March, without any worse incident than a panic caused by stories of Aba Kasse, described as a sort of Fra Diavolo or Robin Hood, who, after a career in which cruelty and generosity were oddly combined, was taken prisoner by Prince Kassa, blinded, and turned adrift to beg his bread. At Adowa the Viceroy received the party courteously, drenched them with a liquor called *tedge*, a sort of mead, and placed a hut and some stretchers at their disposal, which unluckily swarmed with vermin. The same dignitary also feasted the author and his companions with large cakes of bread dipped in pungent sauces, and they had ample time to visit the bazaar and the churches, and to make their acquaintance of a certain Doctor, or Baron, Schimper, a German savant, who had resided for thirty-seven years in the country, studying botany and geology, and making his own candles and a curious compound of *tedge* and brandy, to which the author generously accords the strange title of good champagne. At this point we have a condensed narrative of what was done by the Portuguese who penetrated into Abyssinia in the sixteenth century, and who "instructed the natives in the arts of cutting stone, building bridges, making mortar, painting frescoes, cultivating fruit-trees, manufacturing gunpowder, and many other things." Life here was pleasant enough, in spite of innumerable flies, howling dogs, a blazing sun, and an atmosphere charged with electricity. The travellers took rides over the plains near the city, and sometimes passed the heat of the day in a lovely glen watered by a clear stream, and enlivened by humming birds and butterflies; and they accompanied the Viceroy on a visit to the ancient capital of Axum, where they saw fine cedars planted by the Portuguese, as well as the gigantic monoliths and square blocks of granite mentioned by Bruce one hundred years before. They did not, however, light upon a stone which that traveller describes as bearing an inscription of the Ptolemies, and some Greek letters existing at the time of his visit have now been effaced. But the cathedral erected by

the Portuguese was still standing, and Mr. De Cosson thinks it was intended to serve the double purpose of a house of prayer and a stronghold of defence in times of danger. We wish that a sketch or photograph had been given of the great stone of Axum, which, sole survivor of a great number, still remains upright, and is described as five feet higher than Cleopatra's Needle. We should have preferred this to sketches of exaggerated lions and open-mouthed hippopotami.

When Mr. De Cosson had got back to Adowa, and was tired of the Abyssinians and their filthy customs of deluging their hair with liquid butter, swilling gallons of beer, and gorging themselves with raw meat, the difficulty was to recover the baggage, which had been left behind, and to make a fresh start. And we must refer readers to the volumes themselves for an account of the manner in which obstructions were overcome, and for a brief chapter on Habsli, or Abyssinia, for these words are really the same. The author at last was compelled to leave Adowa with only a couple of servants, and to travel by night over a difficult road, surrounded by laughing hyenas; and here a sad mishap befell him. A porter made off with a part of the baggage which contained the writer's diary, and the journey up to this part had to be rewritten from memory or from the notes of a friend. However, a promised escort came up about this time, and a native lady availed herself of it to join her husband. In her, good looks, excellent horsemanship, hardness and endurance of fatigue were combined with the utmost propriety and modesty of demeanour; and the picture is a sufficient condemnation of the general Oriental practice of inuring women in the zenana and leaving them no employment but intrigue and coquetry. During the ride through the mountains occurred the only serious crisis in the journey. A certain chief, the adherent of a prince named Warenia, who had been recently subdued by King Yohannes, refused the party a passage just at the top of an ugly-looking gorge; but, after a little diplomacy and a calm display of force, threats were exchanged for friendly treatment, and the travellers were regaled with curries, jars of honey and beer, and other delicacies, till at length, with a parched throat and a frame racked with fever, Mr. De Cosson reached the camp of the King at Ambachara, who sent interpreters to meet him, and characteristically cut up a whole cow in his honour, piling the joints inside his tent. One presentation to a barbaric monarch, such as is described, much resembles another; but King Yohannes, formerly known as Prince Ivassa, appears in this narrative in a far better light than in that of Mr. Markham. The latter describes the monarch as a "poor creature." In the present work he is brave, fearless, a good soldier, a capital shot, and a shrewd statesman. He complained a good deal of the encroachments of the Khedive; professed intense regard for the English Government; and after some evasions pledged himself to the abolition of slavery, and we can only hope that the pledge may be redeemed.

From the camp to Lake Tzana was an easy trip, much facilitated by the arrangements of the ruler. The scenery at the lake was really beautiful, at an elevation of more than six thousand feet above the level of the sea. We could have wished that the travellers had had time to circumnavigate this inland sea, or at least to get to its southern extremity, out of which the Blue Nile issues. But, after bagging a hippopotamus or two, and finding the tameness of the water-fowl quite strange and shocking, as the native Witos have no guns, the author returned to the royal camp, from which they got away in darkness and silence because his Majesty had worked himself into a furious passion about the slave-trade, and was flogging his chief officials right and left with a new whip of hippopotamus hide. So in drenching rain they started for Gondar, where they made the acquaintance of a Greek merchant named Christophilos, by reputation a wonderful magician, but in sober truth an ordinary villain, who had murdered an Italian friend in the bazaars of Cairo. A Mahometan official shortly after this point endeavoured to get possession of the King's despatches to the author, but was disappointed by a very legitimate ratiſice, and between Gondar and Galabat, alias Melimma, commenced the descent into the plains. The change from the bracing air of the hills to the intense heat and the tropical vegetation of the plains is strikingly described, and the remainder of the journey was evidently performed under very trying conditions. We must draw attention pointedly to the slave-market at Galabat. This disgraceful traffic was there openly carried on in a considerable town, garrisoned by Egyptian soldiers, who were commanded by one of the Khedive's generals; and we cannot be sure that matters have much improved since Mr. De Cosson saw an elderly purchaser handling a young Galla girl "very much as people look at the points of a horse." After Galabat the road lay across a desert, covered with long dry grass which the natives set fire to at night, and white with the bones of numberless dead camels. These animals cannot go on more than three days without water, and the author was reduced to his last bottle, which he very prudently gave to his faint and staggering beast to enable it to reach some wells dug in a remarkable amphitheatre of granite, at which hundreds of camels, cows, and donkeys were slaking their thirst. The description of this remarkable oasis is excellent, and we notice the atmospheric effects so often observed by other travellers who have toiled on for hours to reach a distant point which the transparency of the air deludes them into thinking quite close at hand.

At Abou Harras the jolting or rocking of a camel was exchanged for the shelter of a country boat, which glided smoothly down the Blue Nile—this river, by the way, is

* *The Cradle of the Blue Nile; a Visit to the Court of King John of Ethiopia.* By R. A. De Cosson, F.R.G.S. 2 vols. London: Murray. 1877.

of a rich red colour—as far as Khartoum. The relief to the wearied travellers must have been indescribable, though the boat, every now and then, stuck on a sandbank, and the crew were not conspicuous for readiness or skill on emergencies. Ismail Pasha, who talked French and read Continental journals, entertained the author at dinner, and expressed a hope of making this southern town a splendid emporium. Mr. De Cosson's observation, however, entirely confirms all that we have ever written about excessive and ill-directed taxation and executive mismanagement. From Khartoum to the Sixth Cataract and Berber was a very easy trip, and we cannot be sure of the reason which induced the author to abandon the descent of the river for another uncomfortable walk across a second desert to Suakin on the Red Sea. It may have been desirable to catch a steamer at the latter place, and to visit Jiddah, the port of Mecca; but we should have thought the Nile passage, however tedious, preferable to a fortnight of yellow sand and grit, which had not even the relief of the long withered grass that covered the plains of the southern parts of the Soudan. Splendid sunsets, starry nights, pure and delightful air, and the wild beauty of mountains that "changed their tints every hour of the day," could scarcely compensate for fearful heat and agonizing thirst, which at one place had to be slaked, or rather aggravated, by drinking out of pools of salt water. The author must have had wiriness and endurance to stand this life for a fortnight, living on a box or two of sardines, a cup of coffee, a pipe, and three hours' sleep snatched at intervals twice in the twenty-four hours. Neither should we adopt his recommendation to men who are likely to become "a disgrace to their families and a burden to their friends" in England, that they should exchange the desk or the counting-house for the wild life of a hunter on the plains of the Soudan and the banks of the Atbara. A good-for-nothing clerk or civil servant is, as a rule, not calculated to develop into anything but a good-for-nothing Arab. This part of the journey did, however, introduce Mr. De Cosson to one novelty—the phenomenon of moving pillars of sand and spiral columns of dust. But he thinks that it would be quite easy for a caravan or even a single traveller to escape destruction when these earth spouts burst in dry showers. In our opinion the isolated traveller would have a better chance of getting out of their way than a caravan, in which there are always some stragglers. After this fatiguing journey the Red Sea came in view, and must have been as welcome as a similar sight was to a Greek in Xenophon's retreat. But the weather was hotter and the atmosphere more stifling than ever, and the arrival at Jiddah was followed by a tremendous attack of fever, which yielded to antimony and quinine acting on an unimpaired constitution.

With this the narrative ends; but there are some papers in the appendix which will be found interesting, about the slave-trade, the incapacity of the Egyptian Government to govern the countries it annexes, and the fatality which attends on Abyssinian explorers, most of whom have been speared or have died of dysentery and fever. We may congratulate this author on having escaped the fate of his predecessors. Everything moves rapidly in these days, and we cannot expect travellers to be lost to sight for years, and then reappear with materials sufficient to fill a bookshelf, except perhaps out of Central Africa. These two volumes have their merits both as giving the experiences of a traveller and as illustrating the rule of the present monarch and the state of his subjects, though of course the work cannot stand a comparison with the five quarto volumes which attest the energy and the observation of the celebrated Scotchman, James Bruce of Kinross.

MÉLUSINE.*

EARLY this year a weekly journal was started in Paris, under the title of *Mélusine*, which deserves to be better known than it now is in England. It devotes itself to the publication of all kinds of folk-lore, giving the original texts or translations of tales and songs and sayings current among the people in various countries, but especially in France, describing popular manners and customs, and criticizing books published at home and abroad upon the subjects with which it deals. Such a publication, if it becomes widely known and recognized by scholars as an authority, must needs be a great boon to explorers of the wide field over which it ranges. But it always takes a long time for a periodical to make its way beyond the frontiers of its own country. Fortunately for *Mélusine*, however, the name of one of its editors, M. Henri Gaidoz, has already been made widely and favourably known in many lands through his connexion with the *Revue Celtique*. Each number of the present journal usually contains one or two popular tales, to several of which are appended most valuable notices of variants by Dr. Reinhold Köhler; a few popular songs, some of them accompanied by their musical notes; a number of miscellaneous contributions; one or two engravings, mostly of antiquities; and bibliographical notes. From among the articles which have hitherto appeared, it may be worth while to select a few for more or less detailed notice.

In the first number, for instance, there appeared an essay by M. Gaston Paris "on the study of popular poetry in France."

Although not a new production, for it first saw the light in the *Revue Critique* some eleven years ago, it is not likely to be familiar to English readers; but it is well worthy of the attention of all who collect or compare the songs of the common people, whether in France or elsewhere, so clearly does the writer lay down the laws which collectors and commentators should observe, so forcibly does he plead for conscientiousness and accuracy on the part of all who lend a hand to the good work of preserving the fast-fading relics of all popular poetry. Another good critical article is that contributed to No. VII. by M. Emmanuel Cosquin on the subject of "A Tale from the Far East." The tale in question is the well-known one of "The Fairies and the Two Hunchbacks," of which a variant from Picardy was given in No. V. by M. Henri Carnoy, with an explanation of the stress laid by the fairies on the proper naming of the days of the week. M. Cosquin compares the story with the similar tale given by Mr. Mitford in his *Tales of Old Japan*; of which tale, by the way, a complete version has been recently given by Mr. C. W. Goodwin in a valuable paper read before the Asiatic Society of Japan. There is no mention in the Japanese story of the days of the week, which seems to be peculiar to variants found in the West of Europe. But the removal by elves of a deformity from an agreeable visitor, and its imposition upon a similarly deformed but not equally pleasant imitator, are incidents in which the Japanese and the Breton, Irish, and Spanish forms of the story closely resemble one another. Commenting upon this likeness, M. Cosquin makes some very sensible remarks upon the vagaries of certain enthusiastic discussers of popular tales who, regarding them as the independent creations of the people among whom they are found, employ them as historical or ethnographical evidence, or attempt to extract a mythological meaning from even their most trifling details. A great number of such fictions, being manifestly Eastern stories which have strayed westwards, ought to be traced home and examined in their original form, before they are subjected to any inquiry into their inner meaning. To M. Cosquin's arguments M. Loys Brueyre replies in No. X., refusing to admit that European folk-tales have been borrowed from Asia, saying a good word for the solar myth, and assuming (apparently without good reason) that the Japanese *Wen-story* is of European origin. No. X. also contains an interesting article of great length by M. H. de Charencey, on "The Underground Origin of Mankind, according to American Legends."

Among the *contes* of which the original texts or translations are printed in *Mélusine* are several from Brittany, contributed by M. Luzel. One of these is a variant of the tale of the Master Thief who robbed the King's Treasury, combined with a story about magic implements, the combination depriving the principal narrative of its point by rendering the thief's enterprises over-easy. In another the well-known Grateful Beasts rescue a hero who has saved a heroine from a dragon, but has been robbed of his due honour and reward by an impostor. In this instance it is a daughter of the king of England who is exposed to the monster, which haunts a cavern in the midst of a desolate plain near London. In a third the youngest of three princes brings home the fairest bride, who in this story is a mere fairy princess, for whose eccentric behaviour no sufficient reason is given. A fourth is a Breton variant of the tale of "The Lad who went to the North Wind"; and a fifth describes the time-honoured tricks by which a confiding widow was induced to part with property for the supposed benefit of her deceased husband. A sixth, which tells of the fortunes made by three brothers, to whom their father bequeathed a cat, a cock, and a ladder, is rendered valuable by a learned note by Dr. Reinhold Köhler; as also is a seventh, which deals with a Dancing Water and a Singing Apple and a Bird of Truth. M. Luzel, we may observe, also contributes an interesting article on "La chapelle-dolmen des Sept-Saints," near Plouaret. The Seven Saints from whom it takes its name are the Seven Sleepers of Ephesus, their fame having been introduced into Brittany, says M. Ernest Renan, in a note appended to M. Luzel's article, by means of the translation of their Passion made with the aid of a Syrian interpreter by Gregory of Tours. There was formerly, it seems, an *Eglise des Sept-Saints* at Brest, but it was destroyed by fire in 1841. It was really dedicated to the seven martyred children of St. Felicitas, but its name was accounted for by popular tradition as follows:—The wife of a baker having given birth to seven children at once, her irritated husband put them into a kneading-trough, and sent them to sea. It was washed ashore at Brest, where the small wanderers were hospitably received. But they soon died, and their bodies were carried away by angels; whereupon a church was built in their honour on the site of the house which they had tenanted during their short stay. Besides the Breton tales collected by M. Luzel, *Mélusine* contains others contributed by MM. Loys Brueyre, Nérée Quépat, and Henri Carnoy. M. Brueyre, the author of a work on the *Contes populaires de la Grande-Bretagne* which testifies to his intimate acquaintance with our literature on the subject, has also written three long reviews of English books—Mr. Gill's *Myths and Songs from the South Pacific*, the English translation of Kink's *Eskimo Tales*, and Thorburn's *Bannu*. Among the *contes* which he contributes are two *Oreole* specimens. In one of them a tiger, having treacherously killed a sheep, is punished by the Queen of the Birds, who induces it to allow its head to be cut off in order that it may be in supposed keeping with the birds which appear at a ball with their heads concealed under their wings. The other is a variant of the well-known tale in which two girls of different characters visit a witch and are by her rewarded according to their deserts.

* *Mélusine*: revue de mythologie, littérature populaire, traditions et usages. Dirigée par MM. H. Gaidoz et E. Rolland. Paris: V. Viant, 1877.

Among the songs, many of which are given with their musical notes, there are several which are quaint and interesting. As a specimen of the more pathetic ditties may be mentioned the ballad from the Vosges, of "La Triste Noce," which tells how a youth who loved one damsel was forced to marry another, and how his forsaken love danced at his wedding till she dropped down dead, whereupon he cut his throat, and the wedding guests exclaimed, "Grand Dieu! quel triste nocé!" the moral being

Les jeunes gens qui s'aiment,
Mariez-les ensemble.

Among those of a lighter nature the palm may be given to a Breton song contributed by M. Luzel, which describes how all the birds flocked together to the marriage of the wren, with the single exception of its rival, the eagle:—

Tous les oiseaux s'y trouvèrent,
Il n'y en eut qu'un seul qui ne vint pas.
Aux noces du Roitelet,
L'époux est tout petit.

Perhaps the most striking of the specimens of popular poetry given in *Mélusine* are the Corsican *coceri* or lamentations sung over a corpse. No. II. contains one of those which are sung tranquilly on the occasion of a natural death, the scene being represented by a woodcut which accompanies the text. In the poem a widow mourns over the remains of her husband, and enumerates his merits:—

Il était mon orange colorée,
Mon plus rare décor,
Mon gobelet d'argent
Tout ciselé d'or;
Mon plat d'honneur,
Mais aussi le comble de ma douleur.

In No. V. we have the literal translation of a *vocero* suited to a violent death. In the engraving which illustrates it the body of a man who has been shot lies prepared for burial. Around it, in various attitudes expressive of rage and despair, stand or kneel a number of women with wildly dishevelled locks. In the song a sister describes a brother's murder, and declares that she will avenge it:—

D'une race assez grande
Une sœur reste seule,
Sans cousins-gérains,
Pauvre orpheline et jeune fille.
Mais pour faire ta vengeance
Sois tranquille, elle-même seule suffit.

With these two engravings may be compared another, given in No. IX., which is taken from a funeral urn found at Clusium, and which seems to represent the performance of a *vocero* antique.

Among the miscellaneous records of manners, customs, superstitions, and the like, may be mentioned the following. In some parts of Normandy it seems to be still believed that during the interval between Christmas and Epiphany the souls of the dead visit their descendants and give them advice. In older times also it was the custom, as is said to be still the case in some parts of Russia on the Eve of All Saints, after supper was over, to set out a fresh supper, intended for the souls of the deceased members of the family. The living retired from the room, leaving the windows open in order that the dead might enter and enjoy themselves. In spite of such beliefs good ghost stories appear to be rare. We read, however, of a man who lived in a house of which his remote ancestors had become possessed by foul means, and who one night saw the soul of that ancestor come out of the chimney looking as black as a coal. It was soon followed by the souls of the son, grandson, and so on of the original wrong-doer, each fairer in hue than its predecessor, until at last there appeared the soul of the seer's father, as unsmirched a ghost as was ever seen. Whereupon the householder rejoiced greatly, but it does not appear that he thought it necessary to make restitution. Another legend tells how the Catholic family of a Huguenot lord, named Tournebouf, went one Christmas Eve to midnight mass. But the heretical head of the family refused to do likewise, swearing that he would prefer to be roasted alive. When the family returned from church, they found him roasting before the kitchen fire, on a spit which was being turned by a huge black cat. In many countries it is supposed that whirlwinds are caused by wizards or witches who circle within them, but in some parts of the department of the Orne storms are attributed in like manner to the clergy. Some years ago a parishioner who saw his crops threatened by a hail-storm fired into the menacing cloud. The next day he heard that the parish priest had broken his leg, owing to a fall for which he could not account. In many parts of Europe it is asserted that the sun dances on Easter Sunday, but in the *Pays Messin* not only does the sun dance, but when it rises the sky is full of brilliant colours. These are the varied hues of the robes of hosts of angels who are dancing for joy. A less pleasing belief is that of the women near Vaucluse, who take their babies to church on Easter Sunday and turn them head over heels when the *Gloria* is sung, deeming that they will thereby save them from falls in after life. The babies do not appreciate the operation, and the church resounds with their expostulations.

It would be easy to select many more passages worthy of notice in *Mélusine*; but what we have said will suffice to show that it is a periodical which, if well supported, will be likely to prove of value to all students of folklore, and of interest to a wide circle of

readers. In a forthcoming number of *Mélusine* will be given a full account of the widespread traditions about the fairy being from whom the journal derives its name.

FOUR STUDIES OF LOVE.*

THESE *Four Studies of Love* show much of both literary and dramatic talent. Three of them have been actually adapted from written dramas, and they abound in striking or effective situations. The interest is sustained throughout, and the characters, although seldom elaborated, are cleverly and consistently conceived. Mr. Dubourg shows no little knowledge of the working of the human heart, and analyses the course of the feelings and passions with considerable subtlety and delicacy. Nor do we know that his stories are at all the less piquant that there is some slight tendency to exaggeration and caricature, since they scarcely degenerate into the melodramatic. If one objected that some of his incidents are far-fetched or unnatural, he would probably answer that he is a firm believer in the power of love, and has honestly embodied the faith that is in him. The love he delineates and illustrates is by no means a merely ethereal and spiritual influence, but the natural feeling of flesh and blood. We are far from saying that there is anything immoral or even unpleasantly sensuous in his tone. But it is certain that he sometimes lards his heroines in frames of mind that are dangerous, and subjects them to compromising impulses. In their overwrought excitement, they burst out into language which is blunt and free-spoken, to say the least of it; but if he brings them to the brink of the opportunities that may make them Magdalens, he always makes repentance precede the fall. His treatment of religious or pseudo-religious subjects we like much less. Clearly he has a holy horror of cant; but his detestation of it carries him decidedly too far. His mockery of snuffling morality and sanctimonious talk sometimes approaches very nearly to profanity, which is the less excusable or excusable since the artistic temptation is so small. Nothing, we should fancy, can be more easy to reel off by the yard than such a parody when once a little practice has taught one the knack of it; and, were it not so, the class of people whom Mr. Dubourg caricatures with so much iteration would not lay themselves so naturally open to his ridicule. It is an error in taste, and in judgment as well, in a man who may cherish the ambition of being popular; since, for one reader that his levity entertains, at least half a dozen will feel more or less scandalized.

This sin of taste and style chiefly pervades the first of the stories. "Mabel Smith, 'the old man's darling,'" has married the wealthy Jacob Vaughan that she may make her poverty-stricken family comfortable. She had a previous attachment, and had parted from the man who had her heart because neither he nor she had a shilling. Vaughan buys her deliberately, and she sells herself to shame and suffering with her eyes open. It is a tacit condition of the contract that he is to take care of her parents, and, above all, of her invalid sister Mary. Mary is a sorrow-stricken saint, with stock passages of Scripture and the stereotyped phrases of the godly perpetually on her lips. She blesses heaven for a Brussels carpet or for a brace of partridges and bread sauce, as she might for some crowning mercy, whether temporal or spiritual. Her parents chime in, with Mr. Simeon, their petted minister, who, in his weakness for such carnal comforts as a well-cooked dinner or a glass of hot spirits and water, reminds us very much of the Shepherd in *Pickwick*. But we must remark that, though the Smiths and their pastor nauseate us with habitual cant, we are not to set them down as hypocrites. We believe at first as a matter of course that that is Mr. Dubourg's meaning; subsequently, however, it appears evident that they are honest according to their narrow lights, and that it is merely an excess of spiritual pride that blinds them to their exceeding selfishness. They accept all Mabel's sacrifices on their behalf as blessings due to interpositions of Providence; and when she crushes down her love in the extremity of self-abnegation, they offer her their heartfelt congratulations on her triumphs over the flesh and the devil. Mary's death is really rather touching; for though her tricks of thought and speech cling to her to the last, yet in her dying moments she has some vision of the truth, and her real love for her sister asserts itself. But perhaps the most original character in the story is Miss Margaret Lindsay. Miss Lindsay, although she is a thoroughly good woman, who always carries a bagful of tracts in her hand, pointing her sarcasms by selecting tracts with suitable titles, is a great favourite of the author's. She rises superior to prejudices, and, far from being afraid of compromising her good name, she takes under her special protection the victims of shame or scandal. But Miss Lindsay has a most potent belief in the personality of the devil. She considers it her particular mission to combat him, as she has carefully studied his wiles, and flatters herself that she is in the secrets of his strategy. She cannot help respecting his malignant power in her heart, but it is her policy and practice to load him with expressions of contempt and opprobrium. Proud of the chivalrous bearing of her race, she models her behaviour on that of her warlike kinsmen, and especially of her lamented

* *Four Studies of Love*. By A. W. Dubourg, Joint Author of the Comedy "New Men and Old Aesop." London: Richard Bentley & Son, 1877.

brother Bob, who had the habit of hitting straight from the shoulder as a boy, and who met a soldier's death in the campaign of the Sutlej. "Beast," "hound," "scoundrel," "serpent," are a few of the choice flowers of language with which the lady pelts our great adversary. And she has a hard fight of it to save Mabel from him. Vaughan, who has always been jealous of his wife, devoted nurse as she was to him, has left her rich under the stringent condition of sacrificing everything should she marry again. She would gladly resign all, could she marry her early love, but that would be the renunciation of the fruits of her former devotion, since her family would once more be condemned to destitution. Besides, her lover Foster's only chance of an income lies in a most unhealthy climate, which has already nearly proved fatal. Her husband's relatives, to whom she had been romantically generous while she believed herself absolute mistress of her fortune, treat her with brutal and sanctimonious harshness. It is only from Miss Lindsay that she gets the slightest sympathy. Foster, in his unselfishness and his firm principles of honour, proves himself worthy of her; but she sees her last hopes of happiness slipping away, while the man she has never ceased to adore is doomed to a lingering death. She passes through some very painful and pathetic scenes before she is absolutely driven to despair. Then, in a state of mind bordering on insanity, she boldly offers herself to Foster on any terms. The knot of all these heart-wearing difficulties would be cut when she had once decided to live with him as his mistress. Miss Lindsay, almost as much beside herself as Mabel, is free to acknowledge that Satan holds winning cards; but, with the indomitable courage and constancy that are her characteristics, she fights out the desperate game to the last. And the story tells the way in which she wins it by the help of Mabel's good angel, though the wealth for which Mabel sold herself from a mistaken sense of duty has taken to itself wings, and relieved her of its curse.

The next most important story is "Vittoria Contarini." In that, as the name implies, the scene is laid in Venice. It is in the last days of the Austrian rule in Italy, when the series of Prussian victories in Bohemia were shaking the outlying fibres of the Empire. There is a good deal of humour mingled with pathos in the description of the Contarini household and the up-bringing of the beautiful Vittoria. All the members of the reduced establishment were spies in the Austrian pay, which the noble Contarini himself is perfectly well aware of. Pietro, the male factotum of all work, can parade his disinterested devotion in serving for scanty wages since he is so exceedingly well paid elsewhere. His master affects to be touched and grateful, congratulating himself on being able to checkmate him. But the ablest and most trusted of the spies of the Austrian governor Falkenberg is a certain Father Onefio. The Franciscan friar is no other than the high-born Count Grimani, and Grimani is the affianced husband of Vittoria. He is chief of the great secret society too, and an enormous price is set upon the head for which he professes to be hunting indefatigably. Admitting the possibility of his well-sustained disguise, it is easy to imagine the dramatic situation that naturally arises out of it. But additional and more original complications are introduced by an outrage offered to Vittoria. Colonel von Swettenheim, a *beau sabreur* and an accomplished Don Juan, imprisons a libertine kiss on the lady's lips as she passes through the Piazza of Saint Marc. Her brother resents it with a blow, and a mortal duel seems inevitable. To save her brother, Vittoria seeks an interview with Von Swettenheim, in which of course she exposes herself to terrible misconstruction. The dignity with which she repels his advances alters his mind about her, though not his purpose. He permits her brother to wound him, that he may win her through her passionate gratitude. She proves her gratitude by saving him from a projected massacre of the Austrians; but in saving him she betrays the plot, and foils the purpose of the patriotic conspirators who are headed by her father and Grimani. They cast her off as a traitress, and the excited mob would have torn her to pieces. But, by a sudden and almost incredible transformation, Von Swettenheim's passion for her becomes purity itself; and he behaves with a chivalrous disinterestedness that wins her pardon and very much more. The eyes of her resentful relatives are opened to the actual story of the misconception; they are set free on the morning of their execution by the news of the cession of Venetia to France; and they recognize the nobility of Von Swettenheim, who had been straining every nerve to save them. The somewhat intricate plot is planned with practised ingenuity; and though it undoubtedly involves some strain on our credulity, the final solution is both pleasant and probable.

We need not go into details as to the two remaining stories, which are very similar in their conception and treatment. "Basil's Faith" sets forth the confidence of a high-minded man in the virtue of an injured woman, and he is rewarded by a happy marriage with her, for vindicating her from undeserved aspersions. In "Bitter Fruit" an erring wife painfully works out her repentance in the hospitals at Scutari, and she has the recompense of being reconciled to the husband, whose life she has saved by indefatigable nursing, although she has died in the effort. In fact, these tales are in many respects so good that we are positively inclined to regret their brevity; and we shall be glad to meet Mr. Fitzedward Hall on some future occasion, when he may have favoured us with a novel of the regulation length, free from the faults which disfigure his present volumes.

HALL'S ENGLISH ADJECTIVES IN -ABLE.

WE remember long ago—we think it was in one of the sharp little notes in the now deceased *Christian Remembrancer*—some comments on foot-notes, in which certain books were said to be "all foot-notes, a very *podagra* of literature." Here is truly "a *podagra* of literature" in the shape of this little book of Mr. Fitzedward Hall. For page after page, there is only one line of text at the head of notes upon notes. And in this particular case we are not disposed to object to the *podagra*. The notes are worth much more than the text. Mr. Hall has devoted much zeal and much reading to a very strange purpose, the defence of the word "reliable." Mr. Hall's championship is purely disinterested. We learn from one of his notes that he has written "some eight thousand printed pages, mostly quite unknown and altogether likely to remain so," and that in all these eight thousand pages he has never used the word but once. The one time when Mr. Hall indulged himself with the use of "reliable" was in the Journal of the Asiatic Society of Bengal for 1861, p. 195, "where," he adds, "in a foot-note, I have discussed, at some length, the disputed legitimacy of the expression." We are sorry that we cannot verify Mr. Hall's reference offhand; but we can believe that we have in the present volume the substance of the foot-note in the Journal of the Asiatic Society of Bengal. At the same time we are really obliged to Mr. Hall for "a piece of information" which he tells us that "the reader may consider to be just as valuable as he pleases." We do consider it to be very valuable. If Mr. Hall, who has no objection to the word "reliable," who, on the other hand, is so fond of it that he writes a book in its defence, can write eight thousand pages, whether folio or duodecimo, and in all that mass of writing finds only one occasion when there is any need to use the word "reliable," we hardly need any further argument to prove that the word "reliable" is a word that we can very well do without. If nothing else can be said against it, it is surely at least needless, when its special champion can write 7,999 pages without using it. It seems impossible that, in the course of those 7,999 pages, he should never once have to express the idea which "reliable" is supposed to express; so we must conclude that, every time that he had that idea to express, he found some better way to express it. Mr. Hall's judgment is, "That the English-speaking world has benefited by the introduction of *reliable*, is beyond question." Surely Mr. Hall, who has used the word only once, must feel some qualms at thinking how little he has himself done to benefit the English-speaking world in this particular. Perhaps the book before us may be his penance for the sad failure. Still it is cruel of him not to tell us what the special case was when, once in 8,000 pages, he found that he could not do without "reliable." It is too bad to send us to the Journal of the Asiatic Society of Bengal for 1861, p. 195. We should really like to know how a man who had steadily resisted temptation—for in Mr. Hall's case it must have been temptation—7,999 times, came at last to yield the 8,000th time. In the absence of any such explanation, we can only infer that it was hardly worth while to invent a word which even the man who writes a book in its defence does not find himself called on to use more than once in a lifetime.

It is really, when we come to think of it, one of the funniest things that we have ever come across, that a man who, like Mr. Hall, has plainly read a great deal should not only take up the cause of so ugly a client as "reliable," but should work himself up to such a pitch of zeal as to write a book especially in its favour. One would have thought that a foot-note—at all events a foot-note of the length of one of Mr. Hall's foot-notes—was quite as much as "reliable" could look for at the hands of either its friends or its enemies. But here is a whole book, not indeed all about "reliable" from one end to the other, but of which "reliable" is the leading idea from one end to the other. A vast mass of extracts is piled together to show that "reliable" is as good as a great many other words which have got into use. We are not aware that anybody ever denied this; but we do not see what it proves on behalf of "reliable." But when Mr. Hall shovels out the whole mass of his reading in every quarter—a reading which, for the English of several centuries past, is beyond doubt really great—it cannot but happen that we learn something from his huge mass of extracts. No doubt they are a hindrance to any continuous study of Mr. Hall's own text; human nature fails before the task of reading, in the strict sense of the word, those parts of the book where we get only a line in each page. But Mr. Hall's extracts do illustrate a curious page in the history of the English language. They bring out with great clearness how much our language has lost by losing its power of coining abstract words in English. If we had only kept some such ending as the German *bar*, we might have been spared, not only "reliable," but all these strange words in *-able* and *-ible* altogether. The upshot of the vast mass of instances which Mr. Hall has got together comes to something like this. When our tongue had pretty well lost its power of forming anything like an abstract adjective from its own stores—a power which German still keeps—people began to cast about to supply the want from foreign sources. Sometimes they adopted real Latin or French words, against which there is just as much and just as little to say as against any other Latin or French words which have made their way into English. In other cases they took any verb, whether real English or a foreign intruder, and stuck on the

* *English Adjectives in -able, with Special Reference to Reliable.* By Fitzedward Hall, C.E., M.A., Hon. D.C.L. Oxon. London: Trübner & Co. 1877.

ending -able, without much regard to subtleties about active and passive. Thus, from the fifteenth century to the nineteenth, a crowd of words were formed by different writers, many of which won for themselves a lasting place in the received English vocabulary, while a yet greater number failed to do so. And there is no denying that, both among those which succeeded and among those which failed, there were some which were quite as bad as "reliable." "Laughable," for instance, if we heard it for the first time, would sound every bit as bad as "reliable." So would perhaps "accountable," certainly "unaccountable." As a study in the history of the language, all this is quite worth notice. It shows the odd shifts to which a language is driven when it has, like ours, lost the power of coining words out of its own substance. And of course any large collection of extracts illustrating any of the usages of language has its use in other ways. But we do not see that it helps the least in the way in which Mr. Hall wishes it to help. Mr. Hall's chief argument is from consistency. If you use other words which are as bad, you cannot object to "reliable." Yes; we can; neither in language nor in morals does one wrong step justify another. In neither case can any man be wholly consistent; the best man is he who is least inconsistent. Because a phrase, a word, a custom, which we should be better without has got so firmly established that there is no hope of getting rid of it, that is no reason why we should not withstand the first beginnings of another phrase, word, or custom of the same kind, the establishment of which we may be able to hinder.

Mr. Hall is evidently one of the sect who think it well to be angry. He begins with a rude attack on Sir J. F. Stephen, which lasts through several pages. He goes on with rude attacks of the like kind on several other people. And it is worth notice that the one writer whom he quotes with cordial admiration is Professor Whitney, who in the same way disfigures real attainments by his violent way of speaking of everybody. Mr. Hall gets specially angry when anything is called an "Americanism," commonly without understanding what is meant by those who so call it. It may be that "reliable," like many other strange words, was used, perhaps invented, by Coleridge. But there can be no doubt that it was through American use that the word became at all familiar. So Mr. Hall gets very angry at "proclivity" being called an "American corruption of the language." Such it undoubtedly is. It proves nothing when Mr. Hall quotes a string of seventeenth-century writers as using "proclivity," along with many other words of the same kind, Sir Thomas Brown's "crang" among them. We will not rule too positively that in some kind of technical discourse "proclivity" might not be allowed; but its familiar use is undoubtedly American. It came in at the time of the American Civil War, when people began to talk about "Northern" or "Southern proclivities"—a very awkward, ugly, and needless way of saying that a man took this or that side in politics. So certain uses of the word "guess" and "calculate" are undoubtedly American, though no one thinks that the words themselves were invented in America. It is quite true that many so-called Americanisms are perfectly good seventeenth-century words and phrases which have lived on in America while they have died out or become uncommon in England. We remember a foolish traveller who was troubled because he heard the autumn called the "fall," and a valley called a "bottom." Nor will we take upon ourselves to say that "guess," in its American use, may not be one of the same family. "Calculate" seeks to translate the New Testament phrase "I reckon." But "proclivity" and "reliable" stand on a different ground, or rather on no ground at all. Mr. Hall tries very hard to prove that "reliable" is wanted, and that "trustworthy" will not do as well. The answer is that Mr. Hall has himself proved that either "trustworthy" or some other word will do as well, by writing 7,999 printed pages in which the word "reliable" is not to be found.

As specimens of Mr. Hall's own style of writing and reasoning, we may give one or two sentences which certainly very easily account for the fact that the 8,000 pages are "mostly quite unknown and altogether likely to remain so":—

Be reliable how bad soever, it would be hard to prove that Americans employ it more than Englishmen; and that which seems, to Dr. Latham, a probability, is such, it may be presumed, merely on the persuasion of sinister preoccupation.

In a note Mr. Hall adds:—

Something of the same spirit as Dr. Latham's transpires through the title-page of a work begun, in 1863, by Dr. E. A. Freeman: "The History of Federal Government from the Foundation of the Achaian League to the Disruption of the United States."

We have read this over several times, hoping to find out what it has to do with "reliable," and we have been wholly baffled. Perhaps the connexion is something "rheumatic"—a favourite word of Mr. Hall's, which he is not kind enough to translate. Lastly, Mr. Hall winds up:—

That the English-speaking world has benefited by the introduction of reliable, is beyond question. Nevertheless, the incurable conceit of *arbitrio* *idea* and *adiposa*, on the part of those who have already denounced it, will, doubtless, operate, in the teeth of facts, to their denouncing it still. Nor will they want abundant echoes; seeing that ninety and nine in every hundred of us all, helpless slaves of what a metaphysician might call the acquiescent diathesis, habitually do our thinking and judging by deputy, on almost all matters which call for patient research, for close observation, or even for mental exertion.

When it comes to "acquiescent diathesis,"

"Oho, jam satis est, oho, libelle."

CALENDAR OF STATE PAPERS.—IRELAND.

PROBABLY there is more information for English readers contained in these volumes of Irish State Papers than in any others of the series issued under the direction of the Master of the Rolls. So little is known of the state of Ireland in the reign of James I. that we are glad to find that the preface to the recently published volume has not been cut down to the dimensions prescribed in the new set of Instructions to Editors. These instructions are in the main so judicious that we are a little surprised at the arbitrary selection of the limit of fifty pages for the preface to each volume. We do not know under what permission the editors of the present volume have lengthened their preface to seventy-two pages for the period of four years commencing with January 1611 and ending December 1614; but we cannot affect to regret that they have done so, for the observations they have there made will prove of very great value to readers who are not tolerably acquainted with Irish affairs of the period.

The volume does not contain any of the interesting and exciting matter we have had occasion to refer to in reviewing previous volumes of the series. There is not a great deal to notice till we come to the second half of it, where the meeting of Parliament of May 18, 1613, is narrated. There had never been so long an interval between two Parliaments as now—twenty-seven years having elapsed since the last was summoned. The consequence was that few people understood the proper forms or were provided with the proper dress to appear in the House. Mere ignorance of form, however, will not be sufficient to account for the singular proceedings at the election of Sir John Davys, the Attorney-General, as Speaker of the Lower House. Upon a division taken in the usual way, those who were for the affirmative leaving the House in order that the numbers of both parties might be counted, it appeared that Sir John Davys was elected by 127 votes out of 232, which was the whole number of members. But the Catholic party, or Recusants, as they were called, gathered themselves together in what the narrator calls a *plumpe*, in order that they might not be numbered, and then thrust Sir John Everard into the Speaker's chair. Whereupon two gentlemen lifted the Attorney-General in their arms and placed him in the chair in the lap of Sir John Everard, upon which he and his party left the House and refused to return, alleging that they appealed to the Lord Deputy. It was but a poor beginning of a Parliament of which the Lord Deputy, upon the Speaker being presented to him in the Upper House, ventured to say that "this Parliament excelled all the former as well in respect of the felicity of the time wherein it is called as of the number and worthiness of the persons that are called into it." It was not to be wondered at that Carew, writing in July, should observe that the "face of this Parliament now prorogued threatens ensuing mischiefs."

Those who have not read the preceding volumes of this series of Irish State Papers will best understand the position of affairs by reading through No. 732, which professes to contain a brief relation of proceedings in the Parliament, but in reality gives a short account of Irish disaffection and the methods taken to conquer it from the death of Elizabeth to the date of writing. The writer glances at the failure of the attempt to substitute priests for ministers in Waterford, Cork, and Limerick, and the rejection of the subsequent petition presented by Tyrone at Hampton Court, in which the petitioners had pleaded for a free toleration of their religion. He then goes on to explain how six counties of Ulster had been catechized by the flight of Tyrone and Tyrconnell and the rebellion of O'Doherty and others, and how, notwithstanding all the King's gentleness in not enforcing the execution of laws in matters of religion, the Recusants had even in the English pale rebuilt monasteries where friars publicly preached and said Mass, and actually resisted the payment of twelpence for not coming to church on Sunday to hear "dearly beloved brethren" read in a language which few of them understood. It is singular how little a writer as well acquainted as anybody in that day with Irish character could understand how hopeless was the attempt to force a religion which they hated on a reluctant people. The real grievance in the present instance was the attempt to override the old constituencies of the country by creating new Corporations for what was called the encouragement of the new plantations in Ulster. The English Government had fair warning of the prevailing feeling. The Lords of the English Pale had written to the King in the November preceding inveighing against the new Corporations, and promising firm and faithful obedience to the King if only he would withdraw such laws as touched religion; and on the very day before the meeting of Parliament they presented a petition to the Lord Deputy to the same effect, and within ten days after, the Lords, following the example of the Commons, refused attendance in the house, crying out, "Away with the new Corporations; cast Davys out of the chair, and place Everard in it!" What chance could there be of coercing the religion of a people under the influence of Franciscan friars who preached in the open air to thousands of persons, telling them that the words spoken by English ministers were the devil's words and all should be damned that

* Calendar of the State Papers relating to Ireland of the Reign of James I. 1611-1614, Preserved in Her Majesty's Public Record Office, and elsewhere. Edited by the Rev. C. W. Russell, D.D., and John P. Prendergast, Esq., Barrister-at-Law. Under the Direction of the Master of the Rolls, and with the Sanction of Her Majesty's Secretary of State for the Home Department. London: Longmans & Co.; Trübner & Co. 1877.

heard them, and encouraging them with prophecies of Tyrconnell's return at the head of 18,000 men sent by the King of Spain, and showing them a book which foretold that England would reign but two years more over Ireland? No wonder it was found necessary to prorogue the Parliament till November. Meanwhile a Commission was issued to inquire into the facts of the case as regards the elections and the grievances alleged; and, from the Report given, it appears how utterly unable the Government was to enforce the laws against Recusants.

Notwithstanding this inauspicious beginning, in the Session which began October 11, 1614, everything went on, as the Deputy informs the King, "in orderly and civil fashion." The Parliament passed an Act for the attainder of Tyrone, Tyrconnell, and others, and, what Sir John Davys considered the most important measure that had been passed for three hundred years, the newly-erected boroughs of Ulster were recognized, and, he observes, "will be perpetual seminaries of Protestant burgesses, since it is provided in the charters that the Provost and twelve chief burgesses who are to elect all the rest, must always be such as will take the oath of supremacy." The Speaker's inaugural address threw oil upon the troubled waters, and with a goodly sprinkling of quotations from Latin authors he assured them that he had never doubted that "of that stormy beginning there would come a calm end." And three weeks afterwards, in a private letter to Sir Ralph Wynwood, he describes the unanimity of feeling in the House as being such, that, "if they could meet as willingly and agree as well in a church as they do in a Parliament house, the King should have no cause to maintain any garrison or army in Ireland."

Religion was, in fact, at that time, as it has always been in Ireland, the one insurmountable difficulty. The only thing that is hard to account for in the whole history is the infatuation of a Government that trusted to win over the natives from the influence of the Jesuits by such miserable tools as they used when they expected the bishops of the Establishment to convert them. There was nothing taught by these men but the coarsest Calvinism—a fact which peeps out in these papers, and will be patent to the observation of all when the editors of these volumes reach the year 1617, when the whole of that miserable creed was added to the Thirty-Nine Articles, and adopted by Convocation and Parliament alike. But, independently of their teaching, the scandal of their lives was quite enough to repel any serious inquirers from the belief that they had any sense of morality or religion. This volume is full of indications of the avarice of Protestant Archbishops and Bishops in alienating the lands of their sees to the injury of their successors. So glaring was this fault that the King himself wrote to the Deputy complaining of it, and instancing in particular the Bishop of Derry and the Archbishop of Armagh, whom the Deputy is directed to restrain from perpetrating such enormities for the future. The late Bishop of Derry, it appears, had by these means reduced the value of the bishopric from 1,000*l.* to 400*l.* a year. Nor was avarice the only, or the worst, scandal that existed. Another prelate, the Bishop of Down, had "procured an odious and unlawful separation from his wife, to the great obloquy of the world, and the offence of the religious and well-minded"; but, having timely notice of the prosecution intended to be brought against him, he made off to Scotland. It appears that, amongst sundry other misdemeanours, he had suborned false witnesses to defame his wife in order to get a divorce from her.

Much less, however, could the Government hope to succeed by making martyrs of their bishops and priests. This volume merely alludes to the intention to try to execute the aged Catholic Bishop of Down; we must go elsewhere for the account of the execution of the Bishop and of a priest who was captured with him, and of the reverence for his relics, which were firmly believed by the multitude to have wrought a miraculous cure on a lame man. And yet so foolish were the Protestant bishops that they entertained hopes of converting the Jesuits by argument, as appears by the account given at the beginning of the volume by Babington, Bishop of Derry, who fancied he had persuaded several of them to use the liturgy of the Church of England and join with him in his efforts to "bring this rude and uncivilized people to some good conformity." Undoubtedly, if what the Bishop alleges as to his success with them has any truth in it, it is a very exceptional instance. The constant complaints through the whole volume of the entire failure of all attempts to tamper with the religion of the people leads us to the supposition that Bishop Babington was making out the best case he could in order to propitiate Lord Salisbury in his application for money to meet the "consequent expenses" of this system of proselytizing. The Bishop's representations, which have so much of the *couleur de rose* about them, are contradicted point-blank by a letter written a month later by the Deputy to Salisbury, telling him that "in matters of religion they grow every day more and more contemptuous of them and their profession, and more and more bold and audacious in setting up and maintaining of their own." It appears from several other letters that they did not expect to make converts excepting amongst "the chosen of Jesus Christ." As may be supposed, all the "uniform order set down for suppressing of Papistry and planting of the Church" was utterly unavailing. What could be expected but that the report should go that, "in the advancement of the Gospel, their travels are no way fruitful," when the same writer avows that, with the exception of the Archbishop of Tuam, Dr. Challoner, and Mr. Usher, "he can name no man of the ministry in the kingdom who has knowledge or care to propagate the

Evangel." The falling off, indeed, was so great that he observes that in cases "where hundreds used to come to church scarcely six make their appearance there now."

We have confined our attention chiefly to ecclesiastical matters, because they form the most interesting part of the volume, and have been entirely omitted in the valuable preface of the editors to which we have already referred. And we must content ourselves with referring to that preface for an interesting account of the "Pirates in the Irish seas," and of the original scheme of the plantation of Ulster.

COTTAGE HOSPITALS.*

TWENTY years ago such an institution as a Cottage Hospital did not exist. At the present time there are probably two hundred of them. Only five counties in England are without at least one of these invaluable homes for the sick poor. But the supply still falls far short of what is needed, and, strange to say, the enthusiasm with which the movement was taken up seems to be dying away, and fewer cottage hospitals have been founded in the last three years than in the eight which preceded them. It is very difficult to give any reason for this falling off. Not six per cent. of those started have failed. Public opinion seems more than ever in favour of treating patients, when it is possible, in small groups. The increasing use of machinery in agriculture causes accidents to happen where the sufferers are far away from the county town, and require more experienced treatment than they are likely to receive in their own homes. Can it be that, amongst the numbers of unemployed women who are always agitating for something to do, matrons competent to carry on this work wisely, when once it has been started, cannot be found? Of course in a real village hospital the matron is every thing. She must be housekeeper, nurse, friend, and sometimes doctor and cook to her patients. The ideal matron would decide when Smith, who had been crushed in the quarry, might be allowed to see his sweetheart, how often she should come, and how long she might remain; whether it would be safe to admit Hodge's scolding wife, and how soon Sally Jones might be visited by her children. It would be her business to refuse or accept the offerings of kind neighbours, to smooth the difficulties between rival doctors, to be polite to the Methodist preacher, to be stern in carrying out the orders of the doctor. In short, the matron of a village hospital would need to possess all the qualities which secure success in life—qualities which not one mother in a thousand ever seeks to develop in her daughters. From the want of early training in common everyday duties arises a great deal of that incompetence which is the true secret of the scarcity of "women's work." Almost every known system of nursing has been tried in cottage hospital management. Mr. Burdett gives an admirable summary of the different experiments, and divides the nurses at present employed into four classes—first, the trained nurse from some institution, church guild, or sisterhood; secondly, a married woman without children; thirdly, a woman belonging to the parish who has had some experience, supplemented by a short special training; fourthly, a good assistant-nurse from the county hospital. Each type has its merits and its defects. The first-class nurse is often unwilling or unable to look after the housekeeping and domestic arrangements. A respectable couple without encumbrance might in many cases be found suitable, as the man could look after the garden, without which no cottage hospital is complete; but married couples without children are much sought after, and are consequently scarce. A good-tempered, cheerful, homely body, with some experience in nursing, seems a likely person to answer the purpose; but then she probably turns out to be full of prejudices and wanting in method and management. On the whole, a good assistant-nurse from the county hospital is perhaps the best, until there are ladies to be had who will take up the profession in earnest and qualify themselves for the position of combined matron and nurse.

Mr. Burdett deserves the thanks of the medical profession as well as of every one interested in the sick poor for the admirable little book he has compiled, which is fortunately so cheap as to be within the reach of even a slender purse. It was no easy task to collect and then tabulate his materials. Difficulties of all kinds had to be got over; at one or two places all information was refused. Some hospitals being privately supported, the donors did not think it necessary to give particulars of how the money was spent. At Weston-super-Mare the secretary declined to supply statistics unless a guinea in payment was guaranteed. With regard to this place, however, Dr. Waring, in a pamphlet published in 1867, tells us something:—

Quite another mode of establishing a small hospital has been followed at Weston-super-Mare, which, whenever practicable, is well worthy of imitation. It originated amongst the working classes themselves, on subscriptions of a penny a week, and in the course of the first eight or nine weeks 50*l.* were thus collected. The Committee of workmen appointed to carry out the plan were most energetic in their endeavours, and, to their credit be it said, they collected by pence alone, amongst all classes it is presumed, an annual sum of 160*l.*

It is strange that the secretary should have refused any particulars with regard to management which might have been useful to

* *The Cottage Hospital; its Origin, Progress, Management, and Work.* By Henry C. Burdett, Sanitary Commissioner to the "Sanitary Record," &c. London: J. & A. Churchill. 1877.

others. Still, notwithstanding all impediments, Mr. Burdett has succeeded in collecting a large mass of information, and arranging it in so clear and businesslike a fashion that no one in possession of his book need hesitate to start a cottage hospital because he does not know how to set about the matter. There is a record of the successes and failures in a large number of instances. There is sound advice which will enable beginners to escape the pitfalls into which others have fallen, and to avoid those mistakes which, once made, are often irreparable. There are short hints upon the proper treatment of cases requiring prompt attention, which, if printed separately, would make a more useful tract for distribution than many of those ordinarily left by the district visitor. There are, besides, plans for the erection of suitable buildings, and directions how to make use of an ordinary small cottage. The great secret of success seems to be not to attempt too much until a little experience shows what are the real requirements of the neighbourhood, and what annual subscriptions may be counted upon.

With regard to expenses, the difference is enormous. In one case fifty pounds will serve to start a cottage hospital; in another it seems to require several thousands. Mr. Burdett finds that "the average annual expenditure in 100 cottage hospitals having an average number of 8 beds, and in 34 of which the average number of beds occupied is 6, is 340*l.* 10*s.* This gives the cost per bed as 42*l.* 10*s.* on the whole number, or 57*l.* per bed occupied. When it is considered that the average cost per bed at a hospital like the London was 54*l.* in 1875, being 59*l.* per bed actually occupied, while at Charing Cross the cost was respectively 68*l.* and 91*l.*, and at the Middlesex Hospital 59*l.* in the one case and 72*l.* in the other, it will be seen that, on the score of economy alone, the cottage hospital has much in its favour." It is impossible here to enter into the different details given as to the collection and management of funds, or to discuss in how far the payment by patients has been successfully carried out. It will require a still longer trial to enable us to come to just conclusions on several difficult points, many of which however Mr. Burdett has done much to simplify. Very few cottage hospitals have mortuaries. It even sometimes happens that, if a patient dies, the authorities insist upon the body being taken home by the friends and kept till the burial. The cost of a small building suitable for all ordinary requirements should not be more than two hundred and fifty pounds. The gain to public health and public morality is well worth the outlay. These mortuaries might be lent in any case of sudden death when an inquest was required, and would be a decided improvement upon the present place for such painful inquiries, the nearest public-house. Mr. Burdett observes:—

It is scarcely necessary here to dwell at length upon the horrors a death causes in a crowded cottage, where probably the whole family, six or eight in number, are compelled to find sleeping accommodation somehow in two small rooms, badly lighted, and often worse ventilated. What must be the condition of a family like this when a death occurs? They have to choose between two evils, for, being engaged in hard outdoor labour during the day, they must perforce sleep during the night. Either some of them must occupy the room which common decency, to say nothing of a regard for health, demands should be given up exclusively to the dead, or the whole family must shift as best they can in the other room, small and unsuited though it be at the best. . . . If an epidemic of any infectious disease breaks out in a place where a mortuary is unknown, the living and healthy have to occupy the same small cottage with the infectious dead.

One of the great pleas in favour of village hospitals is that a patient may feel himself quite at home and yet be free from all home worries. A man laid up with a broken leg can see his wife and children occasionally, but he is not kept awake, when sleep means recovery, by a wailing baby. From the window he can catch glimpses of his neighbours' houses, but he is safe from their injudicious, if well-meant, interference. The familiar sound of the church clock tells him how the night is going. The parson, with whose appearance at least he is familiar, is less disagreeable than the strange chaplain of the county infirmary. The doctor who has already attended him is likely to inspire more confidence than a stranger who looks upon the patient as merely number so-and-so, to be speedily forgotten when another case replaces him in the crowded wards. In an early number of *Good Words* Dr. Wynter spoke of the benefit to the invalid of feeling himself linked to those outside by kindly sympathy. "The newly-laid egg is permitted, with the approval of the surgeon, to reach the patient; the pat of butter, the wine sent by the mistress, the beef-tee coming to an old servant from the 'big house,' are not ruthlessly withheld." Then, too, the friendly interest aroused is good for those outside. Whenever the links of sympathy can be kept up between rich and poor, much is done for both parties. There is no doubt that both doctor and parson benefit enormously by a judiciously managed village hospital. A country practitioner is often greatly overworked in consequence of the long distances which separate his patients. He is constantly prevented from giving to a serious case the care and frequent visits which he knows it requires. When the dangerously ill can be brought together near his house they may have several visits a day, when otherwise they might not be sure of even one. The clergyman of the parish often becomes acquainted with those who never enter a church, and who avoid him in his visits to their homes. A cordial feeling may thus spring up and a wholesome influence be gained. There is still one other most important benefit to be touched on, and that is the great advantage of not being obliged to move patients long distances. The county infirmary is often miles away. There is no conveyance to be had but a jolting cart. The weather

is severe, and the patient, who would have had a good chance of recovery, is perhaps killed by the long journey he is obliged to take in search of the skilful nursing which he might have had near home if his village had possessed a cottage hospital.

KING OR KNAVE? *

THE author of *Hilda and I* and *Spiders and Flies* has in her new novel judiciously eschewed the legal technicalities of one of her plots and the inordinate sensationalism of the other; she has kept clear of the Court of Chancery, and has not made a waxwork effigy do duty for an invalid lady whose death it was convenient to conceal. In *King or Knave?* Mrs. Hartley tells a tale of life as it is, or, in the main, conceivably might be. It is a tale in which there are perhaps two heroines, but certainly no hero; where the leading female characters are pure, earnest, and unselfish, but the men, as a rule, the slaves of either weakness or vanity or ill-temper; whilst the plot in which they figure turns on the temptations of the racecourse and the gaming-table, which in real life cause the transference of estates and county influence quite as rapidly and strangely as in the pages of fiction. From the title it might seem as if a hero were contemplated; but the note of interrogation indicates a doubt, which it takes the best part of the two volumes to solve.

The story opens with the arrival at a country parsonage of two children of an Indian colonel, Godfrey and Rhoda Duncombe, twelve and six years old, and an orphan girl of the age of eight, Beatrice Latimer, who is dependent on an uncle of uncertain temper, to be brought up by the rector and his wife. An interchange of family data between the children ends with a promise of the impulsive lad to the friendless but sprightly Beatrice, "that he will love her and take care of her always"; and the delicacy of his little sister's health, together with Beatrice's growing addiction to her king and hero's whims and sports and occupations, tends to cement this more than brotherly intimacy during his vacations. A scene, prettily told, of his trying on his uniform, after getting his commission in a cavalry regiment, first lets us into the secret of Beatrice's heart; for though "she never told her love," she was one of those whose heroes go forth to forget, while the stay-at-home nurses her first fancy into the passion of a life. Soon after Godfrey joins his regiment, and before Sir Ernest (who has succeeded to the family estate and baronetcy) can reach Heatherton Rectory with Lady Duncombe, death has robbed them of their delicate Rhoda, who, in dying, commended Beatrice to their care and affection. The Baronet is an Anglo-Indian with a liver, and his lady a vain ex-beauty; but they take kindly to Beatrice, with whose future, however, her crotchety uncle, Mr. Elphinstone, now begins to interfere. For two years he allows her a finishing governess at the Rectory, and the time is varied by visits to the Duncombes at Shirley. Meanwhile Godfrey is not staunch to his first love, nor keeps his heart free from tares. He has got among gamblers and swindlers, the worst of whom is one Tyler, a *soi-disant* major; the best, a careless adventurer Porroster, who has a refined and lady-like step-daughter, Jessica Middleton, to keep his house at Wingfield Manor. The pity which Jessica evinces for Godfrey when she sees him entangled in the company of her stepfather's associates is mistaken by the vain young man, unwitting of her cherished attachment and reverence for a friend of her late father's—the same Mr. Elphinstone who is Beatrice's guardian—for reciprocation of his addresses. Of Mr. Elphinstone we get a vision at his house in Queen's Gate, where Beatrice Latimer meets him on a set day, as a tall, handsome man of forty, who gives her two fingers, puts her through her paces, and is secretly pleased by her independence. From him she returns to Shirley, where she stays for months, a favourite with both Sir Ernest and his wife. Godfrey comes home for Christmas, and tells Beatrice his difficulties, but suppresses all mention of Jessica. At some private theatricals an accident to a young lady who was to have played Pauline to Godfrey's Claude Melotte, in the *Lady of Lyons*, necessitates good-natured Beatrice's taking the part at the eleventh hour, though not altogether with Lady Duncombe's approval. The account of the acting is lively enough, and, as one might suppose, the old deep-rooted love for Godfrey, "never realized in its intensity till that night," made Beatrice's words of passionate devotion, and the tale told in the depths of her dark eyes, entrance the audience and win their unbounded applause.

The next we see of Godfrey is at a shabby London lodging of Tyler's, picking up a hint or two from the Major, but losing several hundreds to him at *écarté*, through his luck in always turning up the King. For a time, nevertheless, fortune seems to befriend him. Going down to Ascot with Mr. Forrester and Jessica to see his horse Larkspur run, he is more bent on getting Jessica to take an interest in his horse than on cultivating his own family, who are also there; but on returning to her side, which he had left for a few minutes, he finds it occupied by a distinguished-looking man, with whom she is evidently on terms of old and close intimacy—a sight almost enough to spoil the triumph of his horse winning the race. Jessica's friend turns out to be Elphinstone, who, on meeting her unexpectedly, finds his old love quickened, and

* *King or Knave?* By the Author of "*Hilda and I*," "*Spiders and Flies*," &c. 2 vols. London: Chapman & Hall. 1877.

shortly makes a visit to the neighbourhood, with a view to coming to an understanding with her. But a sudden money embarrassment of Mr. Forrester's, which leads to his abrupt levanting with his stepdaughter, makes Mr. Elphinstone's visit futile; and the bachelor goes back disgusted to town, while poor Jessica is hurried off to Paris, where in her loneliness she welcomes the appearance of Godfrey Duncombe, who has come over with Tyler to spend his Ascot winnings. Here, again, her pity and desire to rescue him from the toils of interested adventurers involve Jessica in the semblance of favour to his almost undisguised suit, though she still cherishes the constraining predilection for Elphinstone, which is, however, in some risk of being unrequited through sinister rumours which reach him of her encouraging the attentions of Godfrey. At this point comes a telegram to Godfrey from England. Sir Ernest is dying, and after travelling night and day, Godfrey reaches Shirley station to be saluted by the butler as "Sir Godfrey." Not, however, in full possession. His father has left Lady Duncombe guardian till he is twenty-five, and sentenced Sir Godfrey to another year of minority. As to Beatrice, just then suffering from rheumatic fever at Heatherton Rectory, he leaves her a thousand pounds, and commends her, as Rhoda had done, to his surviving relatives. In her sickness her uncle offers her a home, and nearly at the same time the discovery of Godfrey's heartlessness and deceit about his money difficulties almost determines her to accept a proposal from one Captain Blackmore. On Godfrey's hearing of this, and finding from his mother that she is likely to inherit her uncle's property, a revulsion of feeling, and a hope, perhaps, of retrieving his fortunes prompt him to propose to Beatrice, who meets him with a tender but sisterly refusal. From this point dates the rapid down-fall of Sir Godfrey's fortunes. After some deeper play in town, and a wild-goose chase after Jessica, whose stepfather was dead, he returns to his "coming of age," when, with a fair prospect of attaining the dignity of M.P. and winning the hand of the daughter of a neighbouring peer, he is fain to recoup his forestalled fortunes by a desperate stroke. There is no Beatrice, no Jessica, near to advise. It is Major Tyler's hour. The young Baronet listens to the insidious suggestion of dishonest play. He goes to his club on a particular night for *coûte*, and, goaded by the reflection that it is neck or nothing, that Shirley must go if he does not win heavily that night, he resorts to the trick which he had often practised in fun with Tyler, but which until then his feelings of honour would have utterly repudiated. He stifles these, sets his life and credit on the rascally conjuring trick, and in his agitation turns up, not the *king*, but the *knave*.

Of course the result is social ruin, and Godfrey has to efface himself in the colonies. Meanwhile poetic justice, it seems, ordains that Elphinstone should win as a Whig the county which Godfrey was to have had as a Tory, and buy the estate of Shirley. Beatrice was in Switzerland when Godfrey left England, and knew nought of his ruin till her return, soon after which she was wooed and won by her constant admirer, Captain Blackmore. Jessica is still touring and sketching with an elderly friend, Miss Trevyllian; and Lady Duncombe has transferred herself and her jointure to the Governor of a certain island, Sir H. Pullin, K.C.B. The plot, it will be seen, thickens, and the marrying off of secondary characters presages the end; but the author piles up the honours which crowd upon Mr. Elphinstone unduly high when he makes him, after the marriage of his niece, become the friend of half-a-dozen Cabinet Ministers, and his house at Shirley the "rendezvous for a circle of political, literary, and fashionable people." The climax is when, two years after poor Sir Godfrey's coming of age in the home that knows him no more, Mr. Elphinstone entertains royalty, in the shape of a juvenile prince and his tutor, in its redecorated halls, and for this receives (a mark of favour somewhat out of proportion to the service) the distinction of a peerage, "no one indeed knowing why, unless for having more money and a worse temper than his neighbours." When Godfrey Duncombe, five years after leaving England so miserably, came back and called in Queen's Gate, the servant who received his inquiries for Mr. Elphinstone and Mrs. Blackmore made answer, "We are not Mr. Elphinstone now, sir; we was made Lord Shirley about two months ago. Mrs. Blackmore and the Colonel is in the South of France." We leave the reader to find out for himself how Elphinstone, before attaining his peerage, brought his love to a crisis with Jessica, and how Godfrey, his sins atoned by an act of heroism, came to owe the last tender offices to his only real love. The conclusion is touching, and not too far beyond the limits of probability.

One of the weaknesses of the plot is the author's unmerited favour to Mr. Elphinstone, who was really an unamiable and selfish prig, and from first to last attracts no one except his old friend's daughter. It is not necessary, because you depress a hero who has "gone to the bad," to set his very uninviting rival on a topmost pinnacle. There is, perhaps, too, some lack of art in prolonging the plot beyond Godfrey's collapse, though it is not easy to see how it could be avoided. Here, as in many other novels, the opening appears to us to have been happy and well conceived, and the building-up of the reader's interest both in Beatrice and Jessica is successfully maintained through the larger part of the first volume. Afterwards, without absolutely flinching, it gets too much dispersed; and it becomes no easy matter to recollect the whereabouts of the *dramatis personæ* at Nice, Genoa, the South of France, New Zealand, London, and Shirley. We can speak with less reserve of the author's general character-drawing. Mr. and Mrs. Colville, Mr. Forrester, and even

Major Tyler, are cleverly drawn in their respective ways; while Miss Trevyllian, with her strong High Church opinions, her rigid virtue and intolerance of Houses or Penitentiaries, and her real charity and goodness of heart at a pinch, makes an excellent subordinate character. "You shut up," she would say, "a tiger in a cage for two years, and expect it to come out a dove. Look after the parents; see how the girls are brought up. Look after your young servants; put down finery; discourage all the nonsense of the present day. Letters coming 'Miss this' and 'Miss that' to the scullery-maid! These are the 'beginnings' which fill penitentiaries, and end in the workhouse or the gallows." We also much like Mrs. Hartley's descriptions of nature in its changeful aspects. She begins with a very happy picture of the drunched vegetation of a midland county, succeeded by a hush and refreshing calm, on a July day. Such scenes, too, as Ascot, the private theatricals, and the coming of age, also show a facility of pictorial power, under reasonable command. In many respects, therefore, we think that the novel of *King or Knave?* may be pronounced an improvement on its predecessors. Not but that there are a few things yet to amend. We note not a few such slips as "petites soins," "coute qui coute" "combating with Beatrice's desire," and the like, which may or may not be printer's blunders. Jessica's habit of addressing her stepfather as "Padre," too, is a little fanciful, since neither he nor she appear to have any Spanish or Italian connexion. On the whole, however, *King or Knave?* is quite worth reading, and, in a sprightly undidactic way, enforces the wholesome moral that honesty is the best policy.

FRENCH LITERATURE.

SOME years ago, during the reign of Napoleon III., a pamphlet was published asking for Frenchmen "the same amount of freedom as was enjoyed in Austria." It certainly seemed surprising that Frenchmen should have to go to the banks of the Danube in search of liberty; now, however—what seems stranger still—we are asked to travel as far as the Volga if we wish to find the problem of "moral order" satisfactorily settled.* M. Legrelle does not care much about Parliamentary Liberalism, but he thinks that social progress is perfectly compatible with what he calls "the principle of authority," and he even goes so far as to accuse our modern Liberals of endangering civilization. These views will startle many persons on the other side of the Channel, now that they are put together in the shape of a volume, and they must have shocked originally all but the habitual and hardened readers of the *Journal de Paris* and the *Soleil*, where they were first published. Setting aside the author's political sympathies, we must acknowledge that he has produced an interesting volume, and given us much information about a country still very little known.

M. Louis Asseline, on the other hand, cannot be accused of the slightest leaning towards *le principe autoritaire*; in relating the history of the Austrian Empire from the death of Maria-Theresa to our own time†, the only fact he finds to praise is the end of the struggle against revolutionary France. M. Asseline's work, based on a careful study of men and events, is preceded by a geographical description of Austria and a brief summary of its modern annals. It is not difficult to show that an empire composed of such heterogeneous parts must seriously test the energy and tact of statesmen. They have to deal not only with the rival pretensions of various nationalities, but with the pressure exercised from without by foreign Powers anxious to take advantage of these rivalries; Pan-slavism on the one side, Pangermanism on the other, are the two chief causes of Austria's anxiety. M. Asseline has set himself to unravel the tangle of which Czechs, Magyars, Roumanians, Poles, Ruthenians, Croatsians, and Saxons form the manifold elements; and the history of all these competing powers gives much variety to his volume. A good map and a bibliographical list have been added.

Captain Chevalier has taken as the subject of a bulky octavo the history of the French navy during the war of American Independence.‡ Few epochs have proved so glorious for that branch of the service, and few are so imperfectly known. It is generally supposed that the excessive caution of Louis XVI. and his Cabinet paralysed the admirals, and was injurious to the success of their operations. But Captain Chevalier maintains that if, towards the beginning of the war, the Court of Versailles was unnecessarily cautious, the battle of Ushant produced a complete change in the direction of affairs. By way of preface he gives a summary of the history of the French navy from the beginning of the seventeenth century to the present time. The work is well written, compiled from the best authorities, and interesting as treating of a subject which is not very familiar even to Frenchmen.

The third volume of General Ducrot's *Défense de Paris*,

* *Le Volga: notes sur la Russie.* Par A. Legrelle. Paris and London: L. Hachette & Co.

† *Histoire de l'Autriche, depuis la mort de Marie-Thérèse jusqu'à nos jours.* Par L. Asseline. Paris: Goussier-Baillière.

‡ *Histoire de la marine française pendant la guerre de l'indépendance américaine.* Par E. Chevalier, capitaine de vaisseau. London and Paris: L. Hachette & Co.

§ *La Défense de Paris.* Par le général Ducrot. Vol. 3. Paris: Dentu.

Illustrated with twenty-eight coloured maps, is a valuable contribution to the history of the Franco-German War. It contains a narrative of the events which took place during the month of December, 1870—the attempt of the Paris troops to make a rally in the direction of Le Bourget, the engagement at La Ville-Evrard, and the bombardment of the eastern fortresses. General Ducrot's style will perhaps be found fault with as too abrupt. It is certainly the very opposite to M. Thiers's academic phrases; but we prefer it for the description of battles, and it is instructive to have the vicissitudes of war, the movements of contending armies, and the details of strategical operations explained by an expert. Besides the facts immediately connected with the siege, we have in this volume a number of documents bearing upon political matters, and the sittings of the Provisional Government are reproduced, generally without any commentary. "The more we proceed with the publication of these *comptes-rendus*, the more," says the author, "we see the irresolution, the weakness, and the blindness which could not but end with the catastrophe we dreaded so much—unconditional capitulation."

Count G. de Serre has completed, by two more volumes, the publication of his father's most interesting correspondence.* After the dissolution of the Duke de Richelieu's Cabinet, the great orator and statesman who had held the office of Keeper of the Seals was appointed Ambassador at Naples, and endeavoured to forget the excitement of Parliamentary life amongst the museums and picture-galleries of Italy. Politics formed, of course, the staple of the four previous volumes; here, on the other hand, the letters are of a more private character, with the exception perhaps of those written by M. de Chateaubriand, which contain interesting particulars about the Spanish campaign. Amongst Count de Serre's best-known correspondents we find the historian Niebuhr, who had become one of his most intimate friends, and who always spoke of him in terms of the greatest admiration. Some of our readers may remember that several years ago an English translation of Niebuhr's letters was published in London; it contains only part of those addressed to Count de Serre, and even they are given in a mutilated form. The volumes before us give the whole correspondence; and the editor has enriched his collection by a number of supplementary despatches and explanatory documents; we notice, in particular, two letters from the Count de Chambord, one from M. Berryer, and a fourth written by M. de Montalembert.

M. Vapereau's dictionary of literature is now complete†, and notwithstanding many unavoidable errors, it will be found an invaluable companion for students. It combines the advantages of a biographical lexicon with those of a treatise on *belles-lettres*, and embodies the results of the latest researches on philological, historical, and æsthetic questions. To a certain extent, no doubt, this new volume reproduces particulars already contained in M. Bouillet's *Dictionnaire d'histoire* and in M. Vapereau's own *Dictionnaire des contemporains*; but the additional matter here published for the first time constitutes more than half the work; and, moreover, the biographical articles have been carefully revised, corrected, and completed whenever necessary.

The "man of former times" whose biography is now introduced to our notice‡ will be remembered by all who have read the correspondence of Count Joseph de Maistre. A Savoyard by birth, M. Costa de Beauregard lived long enough to see the last years of the Monarchy, the Revolution, and the early promise of General Bonaparte. The opening chapters of the volume introduce us to Paris society at the time when it was perhaps the most brilliant; and it is amusing to accompany our hero to Mme. Geoffrin's salon, where Marmontel, Rochefoucauld, Greuze, Diderot, Cochin, and many others, discourse literature, art, and philosophy. Sent off to Paris for the purpose of finishing his education by mixing with all the choice spirits of the day, young Costa writes home brilliant descriptions of the sights he has seen and the company to which he has been introduced. Marmontel is in distress because his *Belisarius* is condemned by the Government censors; Voltaire abuses Fréron; Mme. Geoffrin reads to her guests the letters she receives from her friend Stanislaus-Augustus Poniatowski, King of Poland; Greuze makes himself disagreeable by his suspicious manners and his avarice. The variety of scenes described in this pleasant volume of memoirs, the historical personages crowded together on the canvas, and the account of the noble but fruitless struggle of Savoy against the French Republic, give to the whole work a dramatic interest which derives additional charm from the character of the Marquis himself—a character in which high principle, genuine wit, and patriotism are happily blended together.

M. Tissot, whose *Voyage au pays des milliards* and other anti-Prussian works have already been noticed in our columns, now publishes, as he says, the *pièce justificative* of his own remarks, in the shape of a translation of Dr. Johannes Scherr's volume on Germany.§ A Republican in 1848, and now an ardent admirer of the German Empire, Dr. Scherr is one of the most popular writers of the day; he has often been compared to M. Michelet, and he may be regarded as the best representative of

those free-thinkers who on the further bank of the Rhine temper their rationalism by a considerable amount of what we should call national prejudice. The thick and closely-printed duodecimo before us treats of German society, politics, art, and literature from the earliest times. It is not characterized by much originality, but it abounds in details of a piquant, and sometimes of a rather questionable, nature.

We mentioned just now the name of M. Michelet. A reprint of two of his most popular works has recently been issued. The campaign carried on at the Sorbonne and the Collège de France against clericalism forms, as our readers know, one of the chief episodes in M. Michelet's life. It was the result of a radical change in his political sympathies, and it produced three very remarkable volumes. The lectures on the Jesuits came first, followed by the essay entitled *Du prêtre, de la femme, de la famille*, and two years later on by *Le peuple*.¶ It is undeniable that the transformation of academical teaching into political declamation is a great mistake, and we are glad to know that this opinion is shared by many of the most eminent professors of the French University on the Liberal side. We do not wonder accordingly that M. Michelet's lectures of 1847 should have been suspended. At the same time, both *Le peuple* and *L'étudiant*† contain some of the author's most eloquent pages.

The new volume of M. de Quatrefages‡ is an important contribution to the literature of natural history. The claims of scientific investigation have never been more strongly put forward, nor the limits of legitimate speculation more clearly defined. Study, observe, examine, he says, but, in the face of questions which cannot be solved, acknowledge your ignorance; the true philosopher should know when to withhold his affirmations. The first point discussed by M. de Quatrefages is the place of man in the scale of creation; and here he argues for the unity of the human species, and sets himself to refute transformist doctrines. Whilst declaring that the problem of man's origin is insoluble, he contends that with reference to the antiquity of our race the case is quite different, geology and anthropology having succeeded in obtaining positive results. Polygenists make a great deal of the obstacles which migrations must unavoidably meet with; M. de Quatrefages meets their argument by quoting comparatively recent instances of large displacements of population. The concluding part of the volume is devoted to an examination of the facts peculiar to man; that is to say, language, and moral and religious phenomena. M. de Quatrefages is not one of those champions of spiritual philosophy who only injure their own cause by their ignorance and ill-judged anxiety. He appeals to facts which he has taken great pains to collect and to analyse; and, whilst opposing the theories of the materialist school, he has set to those who share his opinions an example of temperate discussion and accurate research which they would do well to copy.

Dr. Fournié is well known by several important works on the education of the deaf and dumb; the question of language has thus naturally engaged his attention, and now from physiological details he finds himself led to discuss problems of psychology.§ Dr. Fournié's devotion to the experimental method of inquiry does not lead him to make shipwreck on the shoals of materialism, and he belongs to the same class of philosophers as M. de Quatrefages. This fact gives additional interest to the able volume he has just published, and at the present time the fact that a medical man exists who believes in psychology is rather startling. Dr. Fournié begins with a vocabulary of the scientific terms he uses, observing that accurate definitions are of the utmost importance in treatises on philosophy, and he aims at reducing every psychological expression to a corresponding physiological equivalent. He then contends that the study of the body, and that of the immaterial principle which actuates it, are independent branches of research; the examination of the various manifestations of mind—intellect, memory, language, thought, imagination, &c.—comes next; and the volume concludes with an inquiry into the nature and constitution of the mind itself. His style is remarkably clear, and he has applied to the difficult but attractive study of psychology that admirable method which empiricism alone supplies.

The necessity of revising and reforming the vocabulary of scientific terms is pointed out also by M. Francisque Bouillier in his interesting little volume.|| *Sens, sensation, sentir, sensibilité*, are words which the French philosophers of the eighteenth century understood otherwise than we do now, and evidently no inquiry into the causes and results of pleasure and pain can be satisfactorily conducted if we are not first perfectly agreed as to the meaning of these terms. Of the book itself we need only say here that it is the second and much improved edition of a work first published about ten years ago, the leading idea of which is that pain and pleasure account for all the phenomena affecting our nature.

The work of popularizing science has still considerable attractions for many writers, and if we may judge by the supply, the demand for books of this kind is steadily increasing. M. Onésime Reclus publishes, under the title of *La terre à vol d'oiseau*¶, a geographical handbook, profusely illustrated, founded on the best authorities.

* *Correspondance du comte de Serre*. Annotée et publiée par son fils. Vols. 5, 6. Paris: Vaton.

† *Dictionnaire universel des littératures*. Par G. Vapereau. Paris and London: Hachette & Co.

‡ *Un homme d'outre-fois; souvenirs recueillis par son arrière-petit-fils, le marquis Costa de Beauregard*. Paris: Plon.

§ *La société et les mœurs allemandes*. Traduit par Victor Tissot. Paris: Dentu.

• *Le peuple*. Par J. Michelet. Paris: Lévy.

† *L'étudiant*. Par J. Michelet. Paris: Lévy.

‡ *L'espèce humaine*. Par A. de Quatrefages. Paris: Germer-Baillière.

§ *Essai de psychologie*. Par le docteur Fournié. Paris: Didier.

|| *De plaisir et de la douleur*. Par M. Francisque Bouillier. Paris and London: L. Hachette & Co.

¶ *La terre à vol d'oiseau*. Par Onésime Reclus. Paris and London: L. Hachette & Co.

M. de la Blanchère deals with the insects which lay waste our orchards, our gardens, and our vineyards*, and his useful little volume is addressed to gardeners and agriculturists, who, as a rule, know nothing of scientific classification, and care very little to be told whether this or that entomological pest belongs to the tribe of coleoptera, lepidoptera, or aptera. Describe it in plain every-day language, then tell us whether it attacks the leaves or the flowers, the root or the branches—that is quite enough; above all, ask a clever artist to portray it in a neat woodcut. Thus it is that M. de la Blanchère has proceeded, and his new work will no doubt obtain the same success as his book on the *Ravageurs des forêts*; it certainly deserves it.

We have often noticed M. Camille Flammarion's astronomical treatises; they are very valuable, but beyond the capacity of beginners; it was, therefore, an excellent idea which suggested itself to M. Delon when he undertook to condense into a portable and elementary shape the mass of information to be found in M. Flammarion's most important publications.† The twenty chapters or lectures which make up the present little book on descriptive astronomy have thoroughly attained their object; they are well illustrated, and deal with astronomical facts which all readers ought to know.

M. Grimard takes us to the *Jardin d'acclimatation*.‡ As he says in his preface, he asks us to accompany him on a journey round the world; for, without wandering beyond the limits of the Bois de Boulogne, we can study the most useful species of animals which every climate produces. This volume, written in a familiar style, is intended for children, and cannot fail to please them by the number of anecdotes with which it abounds.

We are indebted to the same author for a useful botanical handbook§, which will be acceptable to students in herborizing excursions. It is a descriptive catalogue of the various families of plants, followed by a complete list of vegetable substances, an index of writers on botany, and an alphabetical table.

The amusing narrative of M. Maxime du Camp's voyage to Egypt|| is not a new work, but was first published about twenty years ago. It is a combination of historical sketches, studies of scenery, and pictures of social life on the banks of the Nile.

The progress of modern civilization has given to gastronomy a place amongst scientific pursuits; and therefore we may here mention M. Monselet's *Lettres gourmandes*¶, where menus of the most varied character are served up between anecdotes, accompanied by an *extremes* of sonnets and a *recept* of culinary jokes. The only chapter we feel inclined to suppress is the last, containing the painfully stale anecdote about the discussion in the Roman Senate on the cooking of a turbot.

The novels of the last few weeks are of average merit. M. Billaudel takes a rather odd idea as the groundwork of his book, and the first ten pages are of a questionable nature; otherwise *Les scrupules de Christine*** might be recommended to all readers. Mme. Manvil de Grandfort does not write, like Mme. Julie Fertiault†† and M. Alfred Séguin‡‡, for the express purpose of pointing a moral; but her novelettes are very pleasant reading §§, and introduce us to personages in whose company we need not be ashamed of being found.

One of the most striking features of the present time is the mania for descriptions of Russian society. M. Ivan Tourguéneff, whose novels have set the fashion in Western Europe, and who now comes before the public with a tale of the most stirring and sensational character ||||, introduced to French readers the author—or rather authoress—known by the name of Henri Gréville. It was some time before the pages of reviews or the columns of *feuilletons* would condescend to admit the compositions of Mme. Gréville; but the spell was broken by the publication of the powerful *Expiation de Savelli* ¶¶, and now the newspaper *Le Temps* welcomes every tale which M. Tourguéneff's friend chooses to write. Popularity is a dangerous thing, and we cannot help fearing that it may spoil in this case, as it has done in many others, a writer of unquestionable talent.*** Mlle. Augusta Coupey, like the two authors we have just named, deals with Russian life†††; her novel, of a semi-historical kind, is intended to describe the aristocracy, and one of the episodes it contains is so strangely similar to the plot of the *Dani-Heffs*, that Mlle. Coupey has thought it necessary to prove the priority of her own work.

The interesting account of the lawsuit about Count Monta-

THE SUEZ CANAL.

THE English Government has done something with regard to the Suez Canal, but what it has done is not clear. It has addressed communications to the belligerent Powers, the substance of which is embodied in a despatch from Lord DERBY to Lord LYONS of May 16; but it declines to produce the actual communications themselves, or to answer any question as to their effect. It is impossible, therefore, at present to discuss the action of the Government, except in a very tentative and imperfect way. Probably the Government is satisfied with the practical result that, under present circumstances, the passage of the Canal will be kept open for neutrals generally, and for England in particular, and wishes to defer as long as possible the definition of the conditions which in the interest of India it will be constrained to place on belligerents in this and future wars. It appears that the subject was started by M. DE LESSEPS, who submitted to Lord DERBY a proposal for the neutralization of the Canal which he said had the approval of Duke DECAZES, and which he wished England to recommend for the acceptance of other Powers. After consideration Lord DERBY informed M. DE LESSEPS that the scheme proposed was open to so many objections of a political and practical character that England could not undertake to recommend it. What M. DE LESSEPS proposed was that, in time of war as in time of peace, all ships, public and private, of every Power, belligerent or neutral, should be at liberty to pass through the Canal, the territorial authority being free to prevent ships in transit from disembarking in Egypt any troops or munitions of war. The consequence of the adoption of the resolution would have been that the entrance to the Canal could not be blockaded, and that if a Russian ship of war once got into the Canal it must be allowed to pass through unmolested, provided it did not land troops or munitions during the transit. The rule thus laid down had at least the advantage of being perfectly clear, but it had the demerit of being too clear, sound, and complete. It asked the Powers to commit themselves to more than they might have been willing to accept. This would have led to discussion and delay, and a diplomatic controversy might have disclosed divergences of opinion which would very possibly have made the adoption of a general agreement hopeless. Lord DERBY therefore decided, and properly decided, that England must not consult other Powers, but state and enforce her own views. She must impose conditions on the belligerents in the interest of neutrals, and thus prevent the delays and complications which consultation with other Powers would have rendered necessary. M. DE LESSEPS was delighted with this, and his shareholders were naturally very well satisfied with the announcement that England had promised to take care that the welcome stream of increasing dividends should flow on without a check.

Lord DERBY, in his communications to the belligerents, first addressed himself to the point of the liberty of transit for neutrals. If the entrances to the Canal are Turkish ports—which theoretically they unquestionably are—Russia has the belligerent right to blockade them, and Turkey has the right to exercise all the powers over them which ownership in time of war involves. Turkey might, for example, search all neutral vessels during the transit to see that they were not carrying contraband, or it might

close or obstruct the passage. It might do at Port Said all that Russia does at Odessa. England now interferes to forbid to both belligerents the exercise of their rights. Fortunately neither belligerent has any wish to use them, and England therefore does not thus place herself in a hostile attitude either towards Russia or Turkey. Thus much is clear; but obscurity begins when the relations of the belligerents to each other, and not their relations to neutrals, come to be considered. Does the English Government mean to say that a Russian man-of-war is to be allowed, if once it gets into Port Said, to pass through the Canal unresisted by Egyptian or Turkish troops? This is what the proposed convention of M. DE LESSEPS meant; but it does not seem certain that this is the meaning of the English Government. What Lord DERBY says is that the Porte and the KHEDIVÉ must not impede the navigation of the Canal, or adopt any measures likely to injure the Canal, and that the Canal must not be made the scene of any combat or other warlike operations. The KHEDIVÉ seems to have understood this declaration in the sense that a Russian vessel, if it could once get into Port Said or Suez, must be allowed to pass through the Canal; for he informed the Porte that, if it wished to prevent Russian vessels passing through, it must have a sufficient fleet off the entrance to prevent the enemy's vessels ever getting in. The Porte, on the other hand, does not by any means accept Lord DERBY's declaration if this is what it means, for it has announced that the Canal is to be free to all flags except the Russian, and by this it means that not only Russian men-of-war but Russian merchant ships are to be forbidden to pass through the Canal. Further, on Thursday night Sir STAFFORD NORTHCOTE said that the Government had no wish to prescribe the particular limitations which either belligerent Power shall place on its rights. All that England asks is to protect the Canal from injury or obstruction by either offensive or defensive measures on the part of either belligerent. The Government refuses to discuss what, under certain hypothetical circumstances, the belligerents might or might not do. It leaves them to find out for themselves what they can do with regard to the Canal without injuring it, or impeding its navigation, or making it the scene of any warlike operations.

It must be owned that all this is exceedingly vague, and probably its vagueness is intentional. The English Government wishes at once to threaten the belligerents as little as possible, so as not to provoke a conflict on imaginary cases, and yet to threaten them sufficiently, so as to be able to say, if any case for interference arises, that she has given ample notice that she would interfere. Anything like the clearness of M. DE LESSEPS's rule would commit her more than she thinks prudent at present. The language of Lord DERBY and the explanations of Sir STAFFORD NORTHCOTE are therefore indistinct, and even to some extent contradictory. Supposing, for example, a Russian merchant vessel got into Port Said, and a company of Egyptian troops boarded her and seized her as a prize. As there would be no resistance if she was unarmed, there would be nothing in the act to injure the Canal, or to interfere with its navigation. No neutral vessel would be delayed an hour, and not a shot would be fired. But it is undoubtedly a warlike operation to seize a vessel as a prize, and thus, if Port Said is to be considered as part of the Canal, the Canal would have been made the scene of a warlike operation. If a Russian man-of-war got into Port Said, it is evident that to attempt to stop her from passing through the Canal would

lead to a combat, and to provoke a combat is forbidden. Therefore, it would seem as if Russian vessels, both private and public, if once they get into the entrances of the Canal, must be allowed to pass through it; for obviously a vessel once in the Canal must have every facility given for completing the whole transit, as the Canal is only wide enough for one ship to pass at a time, and to delay an enemy's ship would be to obstruct the navigation for neutrals. But with regard to men-of-war, there is a preliminary question to be solved which is not very easy to answer. Is not the mere passage of a man-of-war a warlike operation? Let us suppose that Russia was sending an ironclad through the Canal to co-operate with its troops in Asia, would not the whole voyage of the ship be one continued warlike operation, of which during the transit the Canal would temporarily be the scene? Lord DERBY might be understood to mean that, if a Russian ironclad got into Port Said, it would not be allowed to pass, but would be conveyed by the English fleet into a Russian or neutral port. This would most certainly lead to war with Russia, or with any other strong Power which in a future war we subjected to the same treatment. For the sake of convenience we must probably invent a new rule, and decide that the passage of a Russian man-of-war through the Suez Canal is not a warlike operation as regards Turkey; which would be very much like deciding that, if the Russian Mediterranean fleet wished to join the Russian Black Sea fleet, the passage of the Dardanelles should not be considered a warlike operation. If this interpretation of Lord DERBY's language is the right one, then the declaration of the Porte is quite out of keeping with it. The Canal is not closed to the Russian flag; but, on the contrary, if a Russian vessel can get into one of the ports of entrance, the Canal is as much open to the Russian flag as the English Channel is. In this case Lord DERBY has really adopted the proposal of Mr. de Launay; and the only variation he has made is that, instead of asking other nations to consent to it, he has said that they shall abide by it. But it was exactly to avoid this kind of logical way of talking that Lord DERBY was prudently vague and obscure, and thus secured to himself, so far as possible, the position, not of isolation from other neutral Powers, but of co-operation with them.

THE WAR.

THE report that Count SCHOUVALOFF brings satisfactory assurances from his Government requires confirmation. It is probable that the English and Russian estimates of the interests of both Powers may not exactly coincide; nor is it even certain that the Russian Government is disposed to make any serious concession in the form of a diplomatic engagement. It would have been better worth while to conclude any practicable arrangement before the war had begun. For several months the less sanguine class of politicians had thought that the great preparations on the European and Asiatic frontiers supplied more trustworthy evidence of the purposes of Russia than the despatches of Prince GORTCHAKOFF or the declarations of the EMPEROR himself. The result proved that the pessimists were in the right; and it may be added that Lord DERBY was one of their number. In expressing through the AMBASSADOR the gratification with which the Government received the report of the EMPEROR's pacific assurances, Lord DERBY added, with singular frankness, the remark that the communication was the more welcome because the Russian armament was at the same moment actively proceeding. There can now be no immediate question of the discontinuance of the contest, for the pacific rumours which have lately been circulated at Berlin and Vienna appear to have no foundation; but it is probable that the Russian Government may attempt by professions of moderation to mitigate the anxiety which is the necessary consequence of the invasion of Turkey. If such overtures are made, it may perhaps be prudent to accept them for what they are worth, though even sincere promises may be rendered nugatory by unforeseen events. If the pledge is limited to an undertaking not to occupy Constantinople permanently, it would throw some light on the plan of the campaign. It would be unreasonable to ask from the Russian Government a public pledge that it will not take advantage for strategical purposes of any advantage which it may obtain. If an understanding with

Austria excludes Servia from the range of warlike operations, it is not likely that the Turks will receive notice of an arrangement which would set a portion of their troops at liberty.

According to credible accounts, 300,000 men are now assembled on the left bank of the Danube in the highest condition of efficiency. The obstacles to a passage which have been offered by the weather and the floods have probably not been an unmixt disadvantage to the invading army. Time has been allowed for bringing all the troops into position, and for accumulating stores at the nearest point to the intended line of operation. Although some loss may probably be incurred in crossing the river, the success of the enterprise is assured. The vast numbers of the invading force will render it easy to distract the attention of the enemy by crossing at different points; and some at least of the attempts will be practically unopposed. The border fortresses, which are now said to have been placed in a defensible condition, may be effectually masked by a third of the Russian army, while the remainder advances to the passes of the Balkan for the purpose of reaching Adrianople. The enormous superiority of the Russians in cavalry will greatly facilitate the advance; and the admirable qualities of the Turkish soldiers will be in great measure neutralized by the incapacity of their commanders and officers. The disproportion of numbers was perhaps greater in 1827 and 1828, and the quality of the Turkish army has since that time been greatly improved; but the organization of the Russian army, closely copied from the German model, will give the aggressor an irresistible superiority. Notwithstanding the unsatisfactory state of the Russian finances, no difficulty seems to arise in providing on the most liberal scale for all the wants of the army. The Turkish Government, on the other hand, is unable for want of money to employ cannon of the best construction, which are rusting in heaps in the outskirts of Constantinople. The vast scale of the preparations contrasts strangely with the modest designs which are attributed to the Russians by some at least of their English partisans. It is difficult to believe that such sacrifices are made for the sake of the oppressed Christians of Bulgaria. The permanent conquest of any Turkish province may possibly be prevented by the intervention of Austria; but the military aristocracy of Vienna dislikes constitutional liberty more heartily than Russian supremacy; and if the counsels of the Archduke ALBERT prevail, the two Empires will perhaps arrange between themselves a partition.

The intended annexation of the whole or the greater part of Turkish Armenia is already almost openly avowed. On that side no philanthropic pretences are required, because the weaker belligerent has neither allies nor protectors in Asia. The progress of the Russian army in Asia has thus far not been seriously impeded. Troops will probably be found for the repression of discontent among the tribes of the Caucasus without weakening General MELIKOFF's army. The report of the recapture of Ardahan proved, as might have been expected, to be unfounded; and it seems probable that Kars is by this time invested. From the announcement in the Russian papers of some unimportant skirmishes, it may be inferred that a Correspondent of the *Telegraph* has too hastily believed a rumour of a crushing defeat in which a large part of the Turkish cavalry in Armenia was said to be surprised and slain. It was not altogether incredible that four thousand Turks or Circassians should have neglected to provide themselves with the means of discovering the approach of an enemy; but so great a success, if it had been attained, would have been at once officially reported. The Russians still appear to be bent on acquiring possession of Batoum. It appears that Poti, to which the Duke of WELLINGTON attached some importance when it was acquired by the Russians fifty years ago, has been found altogether worthless. Batoum and other ports will become valuable possessions if, as is probable, the war produces, among other results, the re-establishment of Russian supremacy in the Black Sea. The extension of the Russian dominion as far as Erzeroum will ensure the military and political control of those provinces of Asiatic Turkey which the SULTAN may probably be allowed to retain. It would perhaps indicate a criminal regard to objects which are now contumeliously described as British interests to disapprove of the occupation by Russia of the upper valleys of the Euphrates and Tigris. The Persians will probably find hereafter that the neighbourhood of the

Turks was, on the whole, preferable to the approach of a more formidable Power.

If the tendencies of faction and prejudice were less familiar to political observers, it would seem surprising that professed indifference to the progress of the Russian arms should be considered by any class of Englishmen as compatible with patriotism. The little sect, indeed, of which the sentiments rather than the opinions are represented by the *Spectator*, avowedly regards the attack of Russia on Turkey as a religious crusade from which sympathy cannot be withheld without a violation of moral or theological duty. Aspirations for the triumphant entry of the Russian army into Constantinople transcend the comprehension of political trimmers or Erastians. There can be no doubt that at the end of the war the question of the passage of the Bosphorus and Dardanelles will be once more raised; and few English politicians at present share Mr. BRIGHT's desire for the free entrance of Russian fleets into the Mediterranean. The doctrine which Mr. GLADSTONE seemed to wish to convey to his admiring hearers at Birmingham is by many degrees less fantastical, though it contains no useful guidance. It would appear that Mr. GLADSTONE still cherishes the belief that the Russians would be satisfied with the hearty co-operation of England in the reform, by coercive methods, of Turkish misgovernment. If the present Government were disposed to make any overture of the kind, it would be checked by the fear of a contemptuous refusal. Recent transactions have tended to confirm the impression, which is almost universal on the Continent, that Parliamentary government exercises a deleterious influence on diplomacy. The proposition is much too sweeping; for a Minister such as CAVOUR or PALMERSTON addresses foreign Governments with far greater effect when he can show that the nation as represented by Parliament is at his back. The recent efforts of a portion of the Opposition to weaken the Government have been too exceptional to form the ground of any general conclusion; but there is no doubt that complications often arise from Ministerial statements which are composed for the purpose of satisfying domestic exigencies, while they are at the same time addressed to foreign Powers. Mr. CROSS's speech had a great effect in conciliating opposition at home, but it was inconveniently definite in its explanations of the policy of the Government; and the warning against interference with the Suez Canal which has been addressed to Russia may perhaps be liable to similar objection. It was quite unnecessary to inform the Russian Government that the greater part of its designs might be accomplished without risk of English interference. A wholesome uncertainty would have been more likely, when the occasion arose, to operate as a check on excessive ambition.

BIRMINGHAM AND MR. GLADSTONE.

ALL parties concerned were probably well pleased when the Birmingham celebration at last came to an end. Although it would be rash to assign limits to the rhetorical capacity of the most copious of orators, even Mr. GLADSTONE's eloquence might have exhausted itself if the feast of words had lasted for another day. Mr. CHAMBERLAIN may now boast that the oracle of which he has ingeniously possessed himself has not yet withheld a response from anxious votaries, although its powers and its good will have been severely tested. There was perhaps a previous understanding between the priest of the shrine and its mysterious inmate that no direct approval of local doctrines should be asked or granted. The political and sectarian Nonconformists of Birmingham may well be content with the sanction which has been virtually accorded to their favourite theories. Mr. GLADSTONE has not pledged himself to the disestablishment of the Church or to the future redistribution of the land. It is enough that he heartily admires the organization which has been adopted for these and similar objects. He has perhaps never before publicly accepted the political designation which has often been applied to him by his opponents; but, in defining a Radical as a man who is in earnest, Mr. GLADSTONE implies the converse proposition that a man who is in earnest is a Radical. That he is himself at all times profoundly in earnest not even his bitterest critic would dispute. It is true that he was not less in earnest when he held opinions opposed to his present convictions; but enthusiasts even more than other men live in the present, and consequently find it difficult to reproduce in imagination previous states

of mind. Mr. GLADSTONE has now taught himself to sympathize with the radicalism which prevailed at Birmingham five-and-forty years ago. At that time the managers of the Birmingham Political Union wildly offered to march with 100,000 men on London to coerce the Crown, the Parliament, and the Government; but the first impediment to their project was the answer of Colonel WILLIAM NAPIER to their offer of the command of the revolutionary army. He was not going, he informed them, to join a tailor and an attorney in a contest with the Duke of WELLINGTON at the head of His Majesty's troops. Mr. GLADSTONE was probably at the time making eloquent speeches against reform in the Oxford Union. Mr. BRIGHT, on the other hand, still cherishes his recollection of the sympathy with which he read the papers which recorded the pugnacious projects of Mr. ATTWOOD and Mr. JOSEPH PARKES.

Nothing could be more appropriate or more unobjectionable than a panegyric on municipal institutions delivered on the occasion of a complimentary reception by the Birmingham Town Council. It is true that Corporations at Birmingham and in other large towns have conferred great benefits on the community. Mr. CHAMBERLAIN was during his mayoralty one of the most active and successful of civic administrators; and it is perhaps owing to his energy that the town which for the first time adopted the Public Health Act only five or six years ago has since atoned for its long neglect by the prosecution of comprehensive sanitary improvements. The purchase of the water and gas undertakings, which was effected at Mr. CHAMBERLAIN's instance, will both enrich the community and facilitate measures for the promotion of the public health. It is found by experience that the municipal constituencies of large towns are not actuated by the short-sighted parsimony which might have been expected from the indifference of the poorer classes to the conditions of health and comfort. A spirited administration of municipal revenues is, for the most part, not unpopular; and the disinterested zeal of the permanent officers of Corporations affords a valuable security against negligence and stagnation. The Birmingham Town Council, notwithstanding its close character, includes some able and enlightened members, in addition to Mr. CHAMBERLAIN himself. In many towns the better class of the inhabitants hold themselves aloof from municipal functions; but the Town Clerk, the Surveyor, and the other principal officers maintain both the efficiency and the continuity of the local administration. Official and professional consciences may generally be trusted, especially when they involve no conflict with personal interests. On the whole, Mr. GLADSTONE was fully justified in his share of the exchange of civilities between himself and the Corporation. It could not be expected that he should remind his fervid admirers of the unjustifiable monopoly of municipal privileges and duties by one political faction. The Birmingham Test Act is quite as unjustifiable as the law bearing that title which was repealed fifty years ago.

Eloquent reproductions of familiar commonplaces on the training for political life which is supposed to be furnished by municipal experience were of course graceful and seasonable; but in Birmingham the process has been effectually inverted; and Mr. CHAMBERLAIN proposes by his federation of Liberal Clubs to extend over the kingdom the Birmingham system of arbitrary and unjust disqualification for local employment. The Corporation of Birmingham is practically elected by the Committee of Six Hundred, which again represents the Liberal Association. In the primary assemblies, as they would be called in the United States, the only qualification for membership is the profession of Liberal opinions, and the voter is allowed to attach his own interpretation to the words. No device could be more judiciously contrived to attract moderate politicians and waverers into an organization which is entirely controlled by vehement partisans. One sufficient test would no doubt be recognized by all sections of the Association. No member of the body could honestly vote at a Parliamentary election for a supporter of Lord BEACONSFIELD against a supporter of Mr. GLADSTONE. In practice it may be assumed that no moderate Liberals have any practical share in the management of the Association. The various Committees and executive authorities are appointed in the American fashion, although political managers as a class are as yet neither as powerful nor as corrupt at Birmingham as at New York. The result of the system is that those citizens of Birmingham who happen to feel little confidence in Mr. GLADSTONE, who are attached to the Church, who object to purely secular

POPE AND KING.

That not only Italian statesmen, but statesmen of many other nations, may find much matter for anxious reflection in the present attitude of the Papacy is incontestable. In France, in Italy, and in Belgium, the clergy are working as hard as men can work to get up a war, the object of which will be to restore the temporal power of the Pope, to break up Italian and German unity, to establish a reactionary monarchy in France, and to do away with all con-

stitutional liberty in Belgium. Those who desire such a war make no secret of their belief that the first manifest step towards the fulfilment of their wishes is to be seen in the recent action of Marshal MACMAHON. Their opponents take exactly the same view, and thus the institution of the present French Ministry is accepted on either side as the triumph of a reaction to which a religious shape is sooner or later to be given. Those who fear the war with which they are threatened look sometimes to the legions of Prince BISMARCK and sometimes to the fervour of French democracy to help them. But they expect the war just as the Turks were sure Russia would attack them, whatever diplomatists might do or say. Nor is there the slightest disguise on the other side. The ecclesiastical party openly announce their intention of getting up a war as soon as they can. For the moment they own the necessity of keeping quiet; but they animate their supporters by the prospect of a speedy conflict. The PAPAL NUNCIO at Brussels has just informed the brave Belgians who are to take part in the combat that Europe is relapsing into barbarism; that nothing but a restoration of Papal supremacy can save it; and that, although prudence now counsels inaction, the time is at hand when there will be an opportunity of using their strong arms. A very curious Society also has chosen the present as a favourable moment for revealing its existence. It is called the "Militia of JESUS CHRIST," and it is said to number a million of volunteers, principally in France and Belgium. Probably this is a great exaggeration; but the Society is so eminently in harmony with the ecclesiastical spirit of the times that it is easy to believe that its ranks will be tolerably full, more especially as women are allowed to be members. This Society is stated by its founders to be modelled on the institution of St. DOMINIC, which "conferred great benefits on society" by the ardent and effectual way in which it combated heresy and schism. Its great object is to be the restoration of the temporal power of the Pope, and until the time comes for effecting this object the associates are to pray, to contribute at least a franc a month to the Pope's funds, to support the Catholic press, and to wear a white cross openly if possible, and, if not, under their clothes. It is, in fact, to be a sort of Ultramontane International. That it will have a considerable success may be safely predicted, just as it may be safely predicted that the remarkable progress of Socialism in Germany will not be without its counterpart in other countries. Socialism and Ultramontanism are the constant enemies of modern society, and they are both beginning to lift up their heads after the defeat they sustained in the German war and the suppression of the Commune. No one can say what will happen in the next few years; but, so far as materials for calculation exist, there is no reason to suppose that modern society cannot hold its own against both its enemies. We may await the struggle without misgiving, but there is every indication that a struggle is coming which will shake the Continent, although England may happily stand outside its influence. How soon it will come depends, perhaps, more on the fate of the present French Ministry than on anything else.

WOMEN'S DISABILITIES.

THE debate on the rights of women could not have come to a more appropriate termination than to be talked out by the advocates of innovation. It was not known, until Mr. COURTNEY wrote to the *Times*, whether he deliberately prevented a division which would have been disastrous to his clients, or paid them the compliment of preferring, after the fashion of women, the opportunity of expressing his feelings to the advantage of effecting his object. It was perhaps a mistake to furnish an additional occasion for the ridicule which in this instance, though it may not be the test of truth, is one of the most formidable obstacles to the establishment of female suffrage. The strongest reason against the scheme is that it is a paradoxical innovation; and paradoxes are so called because they conflict with ways of thinking which may not always find convenient expression. If cynical theorists are in the right, women are not pre-eminently distinguished by logical accuracy; but unfamiliar subjects attract a curiosity and admiration which may be traced in the numerous speeches and pamphlets of the amiable agitators for Mr. JACOB BRIGHT'S Bill; and accordingly they dwell incessantly on an argument which they fondly regard as essentially logical. For some time

past the promoters of the measure have lost no opportunity of dwelling on the supposed inconsistency of allowing women to vote for Town Councillors and refusing to allow them to vote for members of Parliament. The syllogism on which argumentative ladies mainly rely may be put in a plausible and easy shape. No anomaly ought to be allowed in legislation; the difference of the Parliamentary and municipal registers is an anomaly, therefore, women ought to vote at Parliamentary elections. It is forgotten that an opposite and not less legitimate conclusion might be substituted by the withdrawal of the municipal franchise, which was, as Mr. BERESFORD HOPE said, granted almost by mistake. A practical distinction between the two cases which are compared consists in the permanent restriction of the municipal franchise to ratepayers. It is unlikely that any enthusiast, at least of the male sex, will propose to extend the municipal franchise to married women living with their husbands. That the corresponding demand will be made on behalf of the aspirants to political equality is absolutely certain. Mr. FORSYTH was, by a characteristically feminine contrivance, formerly retained to conduct the Bill through the House of Commons on the express ground of his antagonism of opinion to the ladies from whom he received his commission. As he happened not to approve of the grant of votes to married women, it was thought that he would the more effectually cajole the House of Commons into the adoption of a measure which, if it had been passed, would have suggested a fresh application of logic. Why, it would have been asked, should the most important section of the female community suffer disabilities from which the less responsible and less experienced members of the sex have been already relieved?

The cause of female rights suffers a disadvantage from the eccentricities of the small minority of women which at present takes part in social or political movements. Nearly all the leaders of the agitating body plunged with blind vehemence into the opposition to necessary measures for protecting the public health. The error of judgment might be easily explained and readily pardoned; but the excitement which was produced illustrated the inexpediency of allowing women to take a prominent part in legislation. Temperance, vivisection, and many other practical topics must be dealt with by the sex which has not in all cases made up its mind beforehand. As Mr. HANBURY justly remarked, hysterical politicians have of late exercised far too much influence on public affairs; but only a few men permanently hold the doctrine that Governments should be guided by sentiment rather than by calm judgment. Mr. JENKINS'S protest against the arrogant selfishness of England would find a ready echo in a House which represented female constituencies. In private life little surprise is created among those who are unfortunately acquainted with lady politicians by an assertion that any woman who differs from the speaker on the Eastern question is a disgrace to her sex. The smile which is the only answer is not perhaps complimentary; but it would be churlish to argue with a zealot who is certain not to understand any unpalatable argument. White hands, according to the Spanish proverb, can give no offence even by a blow; but their immunity from retaliation depends on a moderate use of the privilege conceded to weakness. One of the favourite arguments of the agitators is that the suffrage is already possessed by multitudes of voters who are but imperfectly qualified for the discharge of political duties. Any inconvenience which may result from promiscuous suffrage is not likely to be abated by the extension of the system which is assumed to have caused the mischief. It is a still more material consideration that, if the borough voters of 1867 were not uniformly wise, they were sufficiently formidable to convince Parliament that it was unsafe to exclude them. It may be offensive to hint that the balance of political forces ultimately depends on physical force; but it is not altogether prudent to disregard natural laws. If on any great question women outvoted men, the defeated party would not for a moment think of submitting. It is perfectly conceivable that at a general election nine-tenths of the female voters might, if a philanthropic agitation were raging, select as representatives only the candidates who would support immediate war with Turkey, or with some other nation which might for the moment be unpopular. Men, if not gentler, are habitually more prudent and infinitely less intemperate. Above all, they will in all countries and ages assert

for themselves the decision of political questions, whether women have or have not votes for the Legislature. It is probable that female suffrage would after a time become absurd rather than injurious by the process of becoming a fiction; but it is not allowable to do wrong in the hope that no harm may come of it. Those who know women best, and appreciate them most highly, are disposed intentionally to abstain from explaining, or even examining, their instinctive conviction that the female intellect and character are ill adapted to the practice of political activity. It is evident that the claim of the franchise virtually involves the ulterior demand for equal eligibility to all political functions.

The depth of the hold which a Parliamentary system has taken on the national belief is proved even by the indifference which is sometimes exhibited to the essential conditions of its successful operation. It is too readily assumed that, because a supreme Assembly has long exercised undisputed authority, the same attributes would belong to a House of Commons which had ceased to represent the political forces of the community. At present all parties are content to accept as decisive the resolution of a Parliamentary majority; but it is at least possible that reckless changes in the electoral basis of the Constitution might weaken the House of Commons itself. When the smaller householders were admitted to the suffrage, they brought with them undoubted elements of strength, as well as possibilities of disturbance. All the women in England would contribute nothing in the nature of power to a House which might in some degree result from their choice. It is highly probable that the most judicious and reasonable women would decline to perform an uncounselling function; and it would be intolerable that elections should be decided by female orators and agitators. It is not impossible that the promoters of the movement may ultimately prevail over the reluctance of the House of Commons to act in opposition to the instinctive convictions of the great body of members. For the present the cause makes no visible progress; for those who engage in such calculations hold that, but for Mr. COURTNEY's pertinacity, the division would have been more unfavourable to the Bill than that of last year. Nevertheless the spirited ladies who devote themselves to the subject will continue to deliver lectures, to canvass for petitions, and to publish monotonous pamphlets and journals. A subscription amounting to several hundreds a year provides the means of agitation; and possibly there may be some minds liable to the influence of incessant repetition. It is boasted that thousands of names are affixed to petitions in favour of the Bill, and that nobody petitions against it. The statement proves too much, because there are certainly opponents of the Bill, although negative petitions are rare, and in this case non-existent. In one sense the lady politicians have the best of the controversy, because their adversaries avoid as far as possible a discussion which could not affect their profound conviction.

FRANCE.

THE Duke of BROGLIE and his colleagues have not escaped the misfortune which seems to follow all reactionary Governments in France. They come into office with a sense that they must justify their existence, and in their hurry to do something they seem to think that it does not much matter what they do or how they do it. The arrest of M. BONNET-DUVERDIER is an eminent example of this temper. The act itself and the circumstances attendant on it are alike calculated to injure the Government which directed it. The speech alleged in explanation of it was, even in the version owned to by his friends, indiscreet and violent in the highest degree. But indiscretion and violence are not characteristics which the present French Cabinet have any reason to dislike in their opponents. Nothing would serve their purpose so well as some overt act of insurrection which would give them an excuse for military repression. If they could shut up M. THIERS or M. GAMETTA, it might be worth running some risk to do it; but M. BONNET-DUVERDIER would have been far more likely, if left at liberty, to injure his own cause than the cause of the Government. Apparent impunity has a highly encouraging effect on the frothy disaffection which is common in Paris, and which has apparently found expression in M. BONNET-DUVERDIER's speech. It is especially unwise in the Ministry to be severe on adverse criticism of Marshal

MACMAHON's policy in recalling the Duke of BROGLIE to power, because that policy itself is not one which makes it prudent to encourage any needlessly minute examination of it. If M. BONNET-DUVERDIER is tried for asserting that Marshal MACMAHON is a traitor to the Republic, it will be impossible to prevent his counsel from arguing that, if the MARSHAL's acts are meant to bear such or such a construction, M. BONNET-DUVERDIER's condemnation of them is not too harsh. Marshal MACMAHON may not have exceeded the limits of his legal powers, but he has undoubtedly gone as near those limits as it was possible to do without exceeding them. In the hands of a skilful advocate such a policy may easily be travestied, and, however loudly the organs of the Ministry may disclaim the interpretation, they cannot prevent every newspaper reader from forming his own conclusion as to which of the rival portraits bears most resemblance to the original. It is the more incumbent on the Duke of BROGLIE to be careful, because there are some journals which are in a sense organs of the Ministry that will welcome any rendering of the MARSHAL's policy which makes him out a traitor to the Republic. Instead of labouring to disprove the accusation, they will accept it as the highest possible compliment to the MARSHAL. Indeed they will go further, and declare plainly that it is only on condition that he either meditates treason himself, or is willing to connive at it in others, that they are prepared to give him their support. There are already signs of a schism among the supporters of the Coalition Ministry. The journals which represent the views of the Orleanist section are anxious to dissociate themselves from any schemes involving a change in the form of government. The MARSHAL, they declare, has no intention of playing the part of General MONK. He is as resolved as ever to remain within the limits traced out for him by the Republican Constitution. To this a Legitimist organ answers that, unless the MARSHAL is prepared to play General MONK's part, the Royalists will have no motive for supporting him. They are not learned in the nice distinctions which distinguish one form of Republic from another; all that they really care about is to get rid as fast as possible of the Republic in any form. They are willing to make allowance for the MARSHAL's difficulties, but they cannot permit a Restoration to be spoken of as though it were excluded from the list of possible endings to the present crisis. With articles of this kind appearing almost daily, it is certainly imprudent in the Duke of BROGLIE to invite comparisons between one treasonable utterance and another.

The manner of M. BONNET-DUVERDIER's arrest seems as much open to question as the policy of the arrest. When once it had been determined to arrest the President of the Paris Municipal Council for seditious language, the obviously prudent course was to make the prisoner of as little importance as possible. If there was the slightest reason to suppose that he would run away, this unheroic disposition should have been carefully encouraged. The spectacle of a conspicuous Radical, or rather of a Radical holding a conspicuous position, running away from justice might have been effective. The spectacle of a Government arresting the President of the Paris Municipal Council at twelve o'clock at night, as though he were a coiner who must be discovered in the act in order to insure that sufficient evidence will be forthcoming against him, is effective also, but not quite in a way which the prudent friends of the Cabinet—if they have any prudent friends—can be expected to approve. The wiser heads among the French Conservatives have of late agreed to treat Paris as a city to which no ordinary rules can be applied, and which must be allowed to remain Radical in virtue of some physical or moral incapacity of being anything else. This is not a perfectly satisfactory explanation of the relation of Paris to France; but it seems, on the whole, to be the one which is most convenient for a Conservative Government to adopt. But it is quite inconsistent with a system of midnight arrests and strict seclusion. If it is essential to the safety of the Government that M. BONNET-DUVERDIER should be brought to trial for alleged seditious speeches, the Government must be supposed to esteem the good will of the Parisians a matter of real moment. Otherwise, why should they be so anxious to rid the Municipal Council of a President who is likely to corrupt his fellow-citizens? Probably this element in the farce is due to M. FOURRIER, who has derived it from the traditions of the Empire. Under NAPOLEON III. it was rather the fashion for the authorities to poke up the unseen volcano on which

France was supposed to be sitting; and M. DE FOURETTOU perhaps cherishes a similar preference for making himself ridiculous when the choice lies between that and doing nothing.

The mention of M. THIERS as the Republican candidate for the Presidentship, in the event of Marshal MACMAHON's resignation, seems likely to make a change in the character of the MARSHAL's appeal to the country. So long as the Cabinet thought that the Republican candidate would be M. GAMBETTA, or even M. GRÉVY, they were very well disposed to let it be supposed that, though the vote at the general election would in form determine whether the Duke of BROGLIE should remain Minister, it would in fact determine whether Marshal MACMAHON should remain President. The language of the MARSHAL's Message to the Chambers evidently implies a conviction, real or feigned, that he has but to let France understand that she can only keep him on condition of keeping M. DE BROGLIE at the same time, to obtain an assurance of popular support which will enable him to set the Left at defiance. Whether in taking this tone he thought that M. THIERS was too old to be a possible candidate, or forgot that the vote which drove him from power was the vote not of the nation, but of an Assembly which had ceased to represent the French nation, is doubtful. But that the MARSHAL or his advisers have at length come to regard M. THIERS as a certain and a very formidable rival is rendered extremely probable by the sudden cessation in the Ministerialist organs of all reference to the MARSHAL's resignation. They do not, generally speaking, say that he will not resign, but they lay much more stress upon the fact that there is no power that can force him to resign, and that, if he does not resign, he is President until 1880. It is easy to see why this reserve should be maintained if the Cabinet are afraid that the prospect of regaining M. THIERS will prove more attractive to the electors than the prospect of keeping Marshal MACMAHON. It will be of no use for the less popular candidate to go to the country with an explicit threat of resignation. The answer of the constituencies will consist of a free permission to carry out his threat as soon as he likes—and the sooner the better. But if the Cabinet can leave the electors uncertain what the MARSHAL is going to do, or, still better, if, without positively pledging him, they can make the electors think that he will remain President whether the verdict of the country is favourable or adverse, there is a chance that, in their dread of what may follow from a prolonged conflict between the PRESIDENT and the Chamber, the constituencies may after all accept the Duke of BROGLIE as an unpleasant necessity. There is some astuteness in this reasoning, and if the electors are of opinion that the MARSHAL is not to be got rid of on any terms before 1880, it is conceivable that it may be borne out by the result. On the whole, however, it seems so improbable that the MARSHAL can remain President with a Chamber elected on this very issue in open antagonism to the Ministers he wishes to work with, and refusing its confidence to any Ministers except those whom he has refused to work with, that the French electors may be expected to see that it is improbable. If they come to regard the MARSHAL's retention of office in defiance of a hostile vote of the constituencies in the light of a mere bogey, they will vote all the more for M. THIERS's candidates. The issue really turns, therefore, on the probability or improbability that the MARSHAL will cling to office against the expressed wish of the constituencies. All that is known of his character and of his estimate of his own position seems to make his taking such a course highly improbable. There is nothing to show that he is thinking of a *coup d'état*; and, if he is not thinking of a *coup d'état*, the retention of office after the decision of the nation has been unmistakably pronounced would be analogous to the defence of a position which has ceased to be tenable. Marshal MACMAHON is too much of a soldier to be easily persuaded into making such a blunder as this.

THE PRISONS BILL.

THE Prisons Bill has been fully considered on the Report, but the discussion in which the House of Commons has been engaged has been more than usually irrelevant. The principal parts in it have been taken by Dr. KENEALY and by certain Irish members, and it has been evident throughout that the heads of all these gentlemen have been with their hearts, and that these have been far away. The Bill deals only with county

and borough gaols, but Dr. KENEALY's imagination is too much occupied with the "unfortunate nobleman" who is wasting away on the bleak table-land of Dartmoor to remember that the House is not considering the case of criminals sentenced to penal servitude. The Irish members have no similar excuse; for, as one of them began the debate on Tuesday with a motion to extend legislation to convict prisons which was in the end withdrawn, they can hardly plead ignorance of the limited scope of the Bill. There is sufficient resemblance, however, between the two classes of prisons to make it easy for a speaker to attack the administration of one kind under cover of a proposal to amend the administration of the other kind. This opportunity was turned to the fullest account on Thursday. Every proposal to relax the discipline in English county gaols was abundantly illustrated by examples drawn from Irish convict prisons. It was only the intervention of the SPEAKER that saved the House from a discussion on the kindred, but scarcely pertinent, subject of the malpractices of the London police. Now that we know that Mr. WHALLEY has for years been a member of "a very zealous Committee" for protecting the public against these treacherous guardians, we ought perhaps to be thankful that we have not heard a great deal more about this subject.

The general drift of the amendments which were proposed on Tuesday and Thursday was uniformly in the direction of greater leniency. Dr. KENEALY began by moving that no prisoner should be flogged for an infraction of prison regulations except upon the verdict of a jury. He followed up this by proposing a clause to make it unlawful to inflict solitary confinement on any prisoner for more than twelve hours, or to withhold from him when in solitary confinement the ordinary diet of the prison. Next came a clause from the same quarter forbidding the use of handcuffs, irons, or heavy weights. After all these proposals had been rejected, Dr. KENEALY moved that prisoners should be attended by their own body surgeons, and that additional facilities should be allowed them of seeing and corresponding with their friends. Sergeant SIMON here took up the running, and proposed the abolition of the tread-wheel and of shot-drill. At this point the further consideration of the Bill was adjourned, and it may be supposed that every expedient for making imprisonment useless has now been disposed of. It is not necessary in order to justify the decision of the House in all these cases to deny that the position of a gaoler is one that may be easily abused, and that the administration of discipline in all prisons needs to be watched with very great jealousy. All the arguments that were alleged in these debates against the surrender of prisoners to the tender mercies of the prison officials were beside the mark. No one contends that there should be any such abandonment of the duty which devolves upon the Government of keeping these officials under strict control. The difference between the movers of the several amendments and the majority of the House related only to the means by which this control should be exercised. Mr. CROSS proposes that it shall be exercised by a body of prison Commissioners, assisted by paid inspectors and by the voluntary labours of the Visiting Justices. These Commissioners will be responsible to the Home Secretary, who is in his turn responsible to Parliament, and can be called to account for any breach of duty on the part of his subordinates. Dr. KENEALY and his allies would substitute for this general supervision a system under which no punishment worth mentioning should be inflicted for misconduct in prison, and no specially unpleasant labour be imposed upon any prisoner. The fatal objections to this latter proposal are that it mistakes the nature and purpose of imprisonment, and that it leaves the gaoler unable, in the last resort, to enforce discipline except by the violation of an Act of Parliament. Underneath all these efforts to ameliorate the condition of prisoners, there seems to lie an impression that they are usually imprisoned without just cause. Dr. KENEALY's faith in human justice has been so shaken by the misfortunes of his distinguished client that he cannot convince himself that any judge or any jury are quite what he or they ought to be. They are not only fallible, but they are too often ready to be deceived; and with this *a priori* probability against every sentence, it is well to be on the safe side, and to inflict nothing on a prisoner that he will very much dislike. Mr. O'CONNOR POWER comes to the same conclusion by a different road. All is fair in war, and every

Irishman who has been convicted of resistance to English law is a soldier in the cause of Irish independence. Adverse fortune has placed him in prison, and the least that his friends who are still at large can do for him is to try and get the law altered for his advantage. As regards punishments of the nature of the tread-wheel, the crank, and the shot-drill, there has long been a school of prison reformers who have wished to supersede them by industrial labour. The fallacy which runs through all their arguments on behalf of this change is that they regard imprisonment as simply directed to the reformation of the prisoner. It is the fault of society that he has been allowed to grow up vicious and ignorant, and society has no business to do anything more with him than to hold him in safe keeping while he is gradually being won to ways of industry and virtue. No one who believes that the reformation of a prisoner is at best a very uncertain process, and that there is much more promise of success about a well-considered effort to deter those who are in prison from coming there again, and those who have never been in prison from doing anything to get themselves there, will be much impressed by this kind of reasoning. When the administration of justice was exceedingly lax and the infliction of punishment exceedingly cruel, there can be no question that many people found their way to gaol who had done little or nothing to deserve imprisonment, and that many of those undergoing imprisonment were treated in a fashion which sent them out more brutalized than they came in. There is no reason to believe that either of these evils are now to be found except, so to speak, by accident. The possible blunder of a jury, or the possible harshness of a gaoler, is not a consideration of sufficient weight to make it expedient to convert every prisoner into a first-class misdemeanant.

Supposing that a gaol is full of prisoners of more or less criminal antecedents, we are at once met by the difficulty that they have no inducement to obey orders or to submit themselves to prison rules. It is of no avail to sentence a man to imprisonment when he is already in prison. He knows the worst that can be done to him in that way. He has made trial of the treadmill, and all the other forms of unremunerative labour. He has learned or refused to learn a trade by which he may support himself when he is released; and neither of these forms of punishment admit of being increased or repeated beyond certain limits. Consequently, if Dr. KENEALY had his way, the prison officials would be helpless in the hands of their prisoners. They would have no means of distinguishing between the violent and the well-behaved prisoner, between the man who was for ever assaulting the warders and the man who seemed really anxious to earn a decent character in gaol, and to make a new start after getting out. It is a necessary element in any adequate system of prison discipline that there should be special punishments for breach of discipline. If a prisoner is to be deterred from relieving the dullness of prison life by any violent outburst that may happen to take his fancy, he must be made to know that there are penalties in store different in kind as well as in degree from those which, as being part of the ordinary prison discipline, are inflicted upon all prisoners alike. These special penalties must be such as will involve some bodily suffering. When a man has just proved that all appeals to his better nature have failed, it is of no use to go on appealing to it still more loudly by way of punishment for his disregard of the former appeal. He must be punished in some way which will give him sharp and instant inconvenience. In other words, he must be flogged, or put in irons, or sent to a dark cell, or condemned to bread and water. If Dr. KENEALY were governor of a prison for a week, he would see cause to change his mind, if not his tone, upon the necessity for this class of penalty.

THE LISBON TRAMWAYS CASE.

THE action of TWYBROSS v. GRANT has now reached—we can scarcely say advanced—another stage. Two Judges of the Court of Appeal having taken one side and two another, the judgment of the Common Pleas Division for the plaintiff, with 700*l.* damages, is for the present sustained. There is, however, to be an appeal to the House of Lords, where the question of law will be settled. Under these circumstances, the question as to what is the right interpretation of the clause of the Companies Act of 1867 on which the action is based has yet to be determined, and

we have no intention of anticipating in any way the proceedings in the House of Lords. It is important, however, that the points of the case, as far as they have been brought out, should be distinctly understood, and these may be gathered from the language of the Judges.

There are two aspects in which the subject may be viewed—first, as to the facts showing what sort of project the Lisbon Tramways Company was, and what was its method of doing business; and secondly, as to the question how far such practices come within the Act. On the former of these points Lord Justice BRAMWELL, although he gave the defendants the benefit of a doubt as to the meaning of the law, spoke very plainly. He showed that, by reason of the various payments to be made to Mr. GRANT, the Duke of SALDANHA, and other persons, amounting together to 122,800*l.*, the contractors would retain in their own hands out of the 309,000*l.* they were to receive only the net sum of 187,000*l.*, which was all that they would have to apply to the making of the tramway. As to the payment for the qualifications of the directors, he said it was undoubtedly an impropriety, which, as he had had occasion to point out some thirty-five years ago, might bring the parties within the law of conspiracy. He went on to remark that in this instance the result was that the directors, having been nominated and qualified by Mr. GRANT for the purpose of adopting a contract prepared before they were constituted, proceeded to fulfil that purpose without having made any inquiry into the nature of the undertaking or the prospects of success. In the event, half the line had to be abandoned, and a new one, wholly different, substituted for the original project; and, in the Lord Justice's opinion, the abandonment of the line was the strongest evidence that the scheme was bad, and the directors had placed themselves in great danger of liability at the suit of the shareholders for their conduct in entering into that contract and going on with the undertaking. The Lord Justice further condemned the practice of getting up artificial premiums; and observed that it was not necessary to enter into the facts to show that, if the plaintiff had known them, he would not have taken the shares. In another part of his judgment, speaking of the concealment of the contracts, he said that he should rejoice if such "nefarious" proceedings could be reached, punished, and prevented; and described in emphatic language the mischief which was wrought by such a system. The Lord Chief Baron, who also held that the conduct of the defendants did not come within the statute, remarked that there was a fraud in the composition of the Company, not in the agreement to pay 45,000*l.* to Mr. GRANT, but in setting up a body of directors whose qualifications were supplied gratuitously, and who, regardless of their duty, allowed themselves to be induced to adopt this contract without any proper inquiry by which they would have found out that this large sum was to be paid to Mr. GRANT for doing nothing or next to nothing. The Lord Chief Justice, who took the view that the Act did apply to the practices in question, directed attention to the significant coincidence that, while part of the projected line was abandoned, and the mileage and number of stations reduced, the price to be paid to the contractors was increased by about the amount required for the payments to Mr. GRANT and the Duke. He also observed that the Chairman of the Company and the principal promoters had made private contracts with the contractors for large sums of money to be paid to them; that the capital of the Company was stated to be 200,000*l.*, with a power of borrowing to the extent of 150,000*l.* more, but would in reality be less by 72,000*l.*; that, while the sum to be expended on the work and on the acquisition of the concessions and other preliminaries was set forth as 310,000*l.*, the items referred to would swallow up four-sixths of that amount; and that these circumstances, if known, would have been calculated to create a well-founded distrust. "These were," he added, "clandestine contracts which involved spoliation of the future Company." As Lord Justice BRETT concurred generally with the Lord Chief Justice, it would appear that the Judges were unanimous on this part of the case—that is, as to the hollow character of the Company and the improper operations in which it had been involved.

It may be assumed therefore that, as the case stands, the only question which remains open is whether or not the conduct of the defendants comes within the 38th section of the Companies Act. That section provides that every

prospectus of a Company and every notice inviting persons to subscribe for shares should specify the dates and the names of the parties, and every contract entered into by the Company, or the promoters, directors, or trustees thereof, before the issue of such prospectus or notice, whether subject to adoption by the directors of the Company or otherwise; and any prospectus or notice not specifying the same shall be deemed to be fraudulent on the part of the directors, promoters, or officers of the Company knowingly issuing the same. There is no doubt that in the wording of this clause there is a certain vagueness as to what kind of contracts are intended to be included; and hence there is room for argument on both sides. Lord Justice BRAMWELL declined to make any attempt at legislation by way of interpretation, and limited himself to simply construing the statute as it stands, his conclusion being that it applies only to such contracts as would impose a burden on the Company or give it a benefit. He held, therefore, that the facts as to the secret contracts were irrelevant to the charge against the defendants, as they did not come within the enactment. The chief consideration affecting the LORD JUSTICE'S mind in forming this opinion seems to have been that many Companies had been honestly formed, and many prospectuses honestly issued, in which no mention was made of contracts not affecting the Company; and therefore that the consequence of maintaining the present action would be to establish that similar actions could be raised in all these cases. It may, however, be remarked on this point that the question before the Court was not as to possible cases which were not before it, and which might never arise, but only as to the case of one particular Company which, it was alleged, was not honestly put before the public. The LORD CHIEF BARON'S judgment was that the ground of action was entirely misconceived, and that the contracts did not fall within the statute. Next came the LORD CHIEF JUSTICE, who adopted the opposite view, that the concealment of the contracts was illegal, inasmuch as investors were kept in ignorance of the fact that a large proportion of the capital, or of the amount to be paid to the contractors, was to be withdrawn from its ostensible object and expended on other purposes. In answer to Lord Justice BRAMWELL, the LORD CHIEF JUSTICE argued that the section was most general and comprehensive in its terms, and evidently applied to all public Companies; and, further, that it expressly referred to contracts which did not require to be adopted by the Company as well as to those which did. Moreover, there was clearly a positive evil to be dealt with, and it was natural to suppose that this was what was aimed at in the statute, when its terms were taken in their ordinary sense. "What," he asked, "in the name of common sense, is the difference in principle between a contract which takes money from the Company's funds by an obligation directly binding the Company and one which saps these funds through a clandestine contract with a contractor? The one form of proceeding is, no doubt, more subtle and insidious than the other, but it is not the less prejudicial to the interest of the Company or less essential to be made known to those who are invited to join it." The CHIEF JUSTICE also pointed out that the transactions of joint-stock companies are quite different from those between private persons, because in the ordinary business of life a man can make inquiries and require positive information, or insist on a warranty, before entering into a contract or embarking in a joint enterprise; but in such vast undertakings as joint-stock companies the individual shareholder is more or less at the mercy of those who invite him to subscribe as to the facts on which the value of the investment depends. In reference to GOVERN'S case, of which much had been said in the course of the argument, the CHIEF JUSTICE, while fully admitting that a person who sells to a Company is no more bound to disclose how, or upon what terms, he acquired the subject-matter of the sale than an ordinary vendor is bound to make such disclosures to an ordinary purchaser, held that in the case of a vendor occupying the position of a promoter there was a fiduciary, or quasi-fiduciary, relation between him and the shareholders, whose interests he was bound to protect and from whom he ought not to conceal anything which was essential for them to know.

It would be out of place, under present circumstances, to consider whether or not the LORD CHIEF JUSTICE had the best of the argument in his able and exhaustive examination of the case. As the question now stands, it remains for the decision of a higher tribunal, which may or may not adopt the same view. In the meantime, however, it is as

well that it should be understood that the only question at issue is apparently not as to the facts of the case, but only whether the law is so worded as to include the practices to which the defendants resorted.

CANAL BOATS.

THE Government have made good their pledge, and have introduced a Bill to regulate canal boats which has already been read a second time. It is impossible to look at legislation of this kind except with a mixture of acquiescence and regret. There is truth, no doubt, in what is said from time to time about the increasing frequency with which the State interferes in the concerns of its subjects. Every year the area of freedom from supervision becomes more contracted. Every year some new department is created, or an existing department has its powers strengthened, in order to maintain a more effectual watch over somebody or other. It is an additional misfortune that legislation of this kind is almost inevitably class legislation. In theory it is meant for the whole community; in practice its application is strictly limited to the poor. Cases of overcrowding as gross as anything that is to be found on board a canal boat are to be found in the servants' quarters of some great London houses. But Government leaves the footman or the housemaid to take care of themselves; at least there is no rumour as yet of a Bill for inspecting furnished houses before allowing them to be let for the season. It is not well that the poor should learn to regard themselves as the peculiar objects either of State benevolence or of State suspicion. Neither position is calculated to foster a self-reliant temper; and, in the absence of such a temper, the supervision of the best-intentioned Government can effect but little. On the other hand, the discovery is constantly being made that some small section of the population is in just as miserable a plight as those larger classes which Parliament has dealt with amidst universal approval. The crew of a canal boat, consisting usually of the wife and children of the man who has the charge of it, are found to be as unwholesomely lodged as the inmates of the houses which are being pulled down under the Artisans' Dwellings Act. The children on board are found to be as ignorant as any of the children whose want of learning called forth the Education Acts, and as completely unaffected by recent legislation as though the Education Acts were only in force on dry land. Why is Parliament to stop short in its benevolent endeavours because the superficial conditions of life on a canal bank or in a canal boat are somewhat different? The need which it thought so imperative when it insisted on every child being sent to school, or upon this or that unhealthy area being cleared, is equally pressing, and if the Legislature is not prepared to undo its past work, it is difficult to see how it can refuse to carry it on still further.

We do not profess therefore to be much in love with Mr. SCLATER BOOTH'S Canal Bill. If we could hold with the *Times* that life on board a barge is "one of the idyllic pictures of English experience," we should be equally disturbed at the notion of the great calm with which it is encompassed being disturbed by so much as a compulsory visit to a registration office. But this idyllic picture exists, it is to be feared, only in the imagination of the writer. At all events, it is an idyl which is compatible with ignorance, disease, and immorality. The children hardly ever go to school; they can seldom either read or write; they are crowded together in a manner which sets all ideas of cubic space at defiance. If Parliament has interfered, and interfered with just cause, in other similar cases, there is no reason why it should hold its hand because the victims of all these evils are not so completely within reach. The fact that they are not so is rather an additional motive for trying to get at them. If they have escaped the agencies which Parliament has hitherto set on foot, there is not much chance of their being reached by those voluntary methods whose shortcomings Parliament has been compelled to supply. If it is possible to improve their condition, there is no more reason that they should be left without instruction and without decent homes than that any other section of the community should be so left. The fact that to a hasty observer the conditions of their existence are more picturesque is no proof of any real superiority. Air is a necessary of life even in a cabin, and

ignorance is as injurious to children who drive a barge horse along a towing-path as to children who follow the plough or frighten birds. The main reason why it has been found necessary to make attendance at school compulsory is that the eagerness of parents to profit by their children's wages is very much greater than their eagerness that the children themselves should profit by their schooling. Parliament no longer recognizes this natural preference on the part of the parent as a reason why a child should be kept from school. Why should a bargee be allowed to make a profit out of his children which is no longer permitted to any other labourer? The last Report of the Factory inspectors mentions what is doubtless the very common case of a boatman who has taken away all his five children from school as soon as they have reached the age of seven, and kept them in the barge. Another father could not do this in the present state of the law, and it is only the necessarily migratory habits of the boating population that make it possible for this man to do it. The local sanitary authorities do wage war, even if it be war of a rather intermittent kind, upon overcrowding and upon dwellings that are plainly unfit for human habitation. But these evils are present as conspicuously in many canal boats as they can be in the most populous quarters of a large town. Some reports which have been printed by Lady BURDATT COTTS, and which contain the letters of a very well-intentioned though singularly priggish missionary whom she has employed to go about on the principal canals and preach sobriety, the advantages of reading, and the duty of being kind to animals, are full of incidental notices of the crowded state of the cabins in which the bargees and their families live. Unless the habit of moving from place to place is to be held to exempt a man from the obligations in the matter of health, decency, and instruction which other men are subject to, it is hard to see how the Government could have done otherwise than bring forward some such Bill as that which is now before the House of Commons.

On the assumption that there is to be any legislation about canal boats, it would be hard to frame a milder measure than Mr. SCOTTER BOOTH'S. It aims at preventing overcrowding on board of boats which are used as dwellings at night, and at making some provision for getting the children of the boatmen to school. The first object is attained by obliging every owner of a canal boat, which is used for a dwelling at night, to register it as belonging to a specified place, and as intended for the accommodation of a specified number of persons of a specified age and sex. The registration authority is to be a sanitary authority, within whose district the canal is wholly or partly situated, and each registration authority is empowered to make rules for registering and numbering boats, for fixing the age and number of persons who are to sleep in them, and for promoting cleanliness and preventing the spread of infectious diseases. The officers of the registration authority are empowered to enter any canal boat for the purpose of ascertaining whether the Act has been disobeyed. Inasmuch, however, as the Act can only be disobeyed at night, and the officers of the registration authority can only go on board the boats during the day, these provisions for inspection do not seem to be of a very alarming character. There is reason to fear that the clause about education will be evaded with equal ease. A child living in a registered boat is for the purposes of the Education Acts to be deemed to be resident in the place in which the boat is registered, and will consequently be subject to any educational by-law in force in that place. If, however, the parent satisfies the school authorities or the registration authority that the child is actually attending school in some other school district, the child shall be deemed to be resident in the district in which he is attending school, and shall be subject to any by-law in force there. So far everything is easy. If it is more convenient to a boatman to send his child to school at one end of his regular journey than at another, the school authority is directed to make the transfer easy for him. But, supposing that a boatman omits to send his child to school at either end of his journey, and, when summoned under the Education Act, pleads that he is never long enough in one place to allow of his child going to school there, what can the magistrates say? The father is bound, no doubt, under the Education Acts to send his children to school. But he is not bound to send them to a boarding-school; and, with a

constantly moving home, how can he possibly send them to a day-school? The Oxford School Board, for example, summons a boatman for not sending his child to school in Oxford, and he thereupon pleads that, if the child is to come home at night, he must travel ten miles along the towing-path to overtake the boat of which he is a registered inmate. This is a case which nothing in the Education Acts seems to meet, and for which it will certainly tax the ingenuity of the Education Department to make provision.

LONDON SOCIETY.

WE have occasionally ventured to speak of some of the characteristics of what, for want of a better name, is called "London society"; and it is with pain that we are forced to recognize that we have never known how to treat our subject properly. London is like the excellent family of the Primroses, who listened with rapt attention to what fell from their aristocratic visitors. "You may depend upon as fact that the next morning my Lord Duke cried out three times to his valet-de-chambre, Jernigan, Jernigan, Jernigan, bring me my garters." If any one in these days ever read the *Vicar of Wakefield*, or even knew who wrote it, we should make an apology for quoting these words at length. Revelations of the inner life of the great, such as Lady Blarney gave, are read with avidity and accepted with credulity. This is the popular style, and the fact that a new edition of a book written by the "Duke de Medina Pomar," whoever he may be, is lying on the Club table justifies the assertion. Here are fine folk indeed, pictures of all the best-known faces in society, the names being so slightly transformed as to leave the reader in no sort of doubt as to who are meant to be represented. Novelists have naturally drawn their characters from living men and women, and it would be difficult to name any book where the peculiarities of some acquaintance of the author have not been caricatured. But the license has, with few exceptions, been used with modesty and discretion. *Almack's* and the *Two Daughters* were each aimed at a particular family, and in the latter case great pain must have been inflicted. In *Lost and Saved* one of the vulgarst women of her day was supposed to have been alluded to; but our task would be endless if we attempted to pursue this train of thought. From Plumer Ward and Scott and Miss Edgeworth, however, down to the days of Thackeray and Lord Beaconsfield, the endeavour has nearly always been made to leave the portrait somewhat undefined. We may fancy we have known Lord Stoyne and Becky, and that we do know Mr. Brancepeth and Lord St. Aldegonde; but in neither name nor habits is there enough to enable us to assert that they have been transferred from real life to fiction. No such veil exists in the "Duke's" book; the smallest personal habits are noted down, and under his guidance we can gauge the character, the conjugal fidelity or infidelity, and the social position of every other person in the Peerage and Court Guide. Besides these advantages, their conversation is detailed at such length as to enable future ages to lay down on "ducal" authority how the best society of this generation talked. Lady Blarney and Miss Wilhelmina are nowhere. We have our own chronicler, and may be proud of him. Here is a fine sentence! "She wants me to go and talk with Lady Isobel Clanfyne, who I see has just arrived with her father the Duke of the Isles," says Miss Petherstone at an evening party. This is modern conversation capitally hit off, just as we might say, "There is Mr. Montagu Corry, who ascends the staircase supporting the arm of the present Prime Minister, Lord Beaconsfield. Both are members of several well-known clubs." It is indeed notorious that in good society no allusion is made to any one unless the chaperon is mentioned at the same time. One sentence we must especially quote, because the "Duke's" expression raises a most interesting question:—"There she is, riding in as handsome a carriage as you would wish to look at," says the Marquis of Belgrave. Not long ago the *Court Circular* announced that the Queen had been "riding" in a carriage, and the next day there appeared a contradiction to the effect that the Queen had not been riding but driving. So here is a sad dilemma! The Queen is on one side, on the other is the Marquis of Belgrave, or rather his author the "Duke." What is the outside world to believe, they who stand opposite the gates of Marlborough House to see a far-off vision of royalty? Fashion and not learning is the arbiter of disputed pronunciation and the use of words. It would be better that the Marquis of Belgrave should in a fresh edition give us a new set of rules, to which purists would at once subscribe. He will teach many things; he no doubt talks of "the Row," of a "talented" man, says "interesting" and "Berkshire," and thinks it vulgar to cat asparagus with his fingers. Rogers said it made him ill to hear people talk of a balcony; what would he have said had he ever met a Marquis of Belgrave?

To speak seriously, the publication of this class of novel is surprising. We have not read one half of it, we do not know what the plot is, or whether there is a plot at all; but what we have managed to wade through is the coarsest, vulgarst, and most contemptible rubbish we ever remember to have seen. It is the sort of stuff that a discarded lady's maid or footman might sit down and write while waiting for the chance of a new place. If this book is a true picture of what it pretends to represent, London society is indeed

very vulgar; but it shows, at any rate, that the *ne plus ultra* of vulgarity is outside it. Low personal details, however, seem to find, for some reason or other, increasing favour. There are four newspapers published now which are as much at a loss for news as the besieged Correspondents were in Paris. The result is a depth of trivial and petty gossip which even the *Court Journal* would shrink from publishing in the winter. One day we are told that the Duke of Teck stopped to look at *Punch* in the street, and that some member of the House of Commons spilt around his seat; and to-morrow we shall no doubt hear that Lord John Manners likes plovers' eggs, and learns into which of his waistcoat pockets Mr. Baillie Cochrane puts his watch, and how many times Mr. Gladstone blew his nose when he last had a cold in his head. What can be the condition of mind of the man who is amused by this kind of rubbish we cannot conceive. Personal interest, and impulses due to sentiment and veneration, we can understand and appreciate. If Rousseau liked to snatch a piece of food on its way to Mme. de Warens's mouth, exclaiming that there was a hair upon it, and eat it himself, the action might be extravagant, but at any rate it was prompted by love, and finds a fit place in confessions. When the end of the cigar which Alfred de Musset had thrown away on the steps of the Opera House was picked up by a fervent admirer, the homage gave the poet infinite pleasure, and is worthy of record. But the Duke of Teck has neither written the *Nouvelle Heloise* nor the lines to Ninon, and he should be allowed to stroll up Regent Street in perfect obscurity and flatten his nose against every shop-window unobserved and unsung. Privacy and retirement are nowadays mere names, and any man above the position of a hansom-cab driver has a newspaper correspondent ready to furnish the public with an account of how he washes at home, and the length of his latch-key. The same pettiness is observable in literature. In the dearth of original work there are half a dozen chiffonniers busy at the ash-heaps thrown away by any writer of merit, and what was considered worthless by its author helps to fill up a contemptible octavo. If there is a place where a man might hope to be free from persecution, it is his own house; but that appears now to be made the usual frame for his picture. If a hostess leaves her guests earlier than usual and pleads a headache as the excuse, the fact is chronicled next day in a newspaper. It is unfortunate that so much notoriety should attach to the proceedings of a certain number of persons during the months of May, June, and July; but we suppose it is rendered inevitable by the extinction of all other societies, and the consequent aggregation of all the leisured classes into one increasing center. If they would only re-inhabit the Georgian houses which exist in half our county capitals, what a pleasant town London would be!

As it is, London society is virtually English society, and what we do and say during those three months is that by which we have to be judged. Things quite possible in old days are possible no longer. Everything is conducted in a blaze of light, and the lookers-on always see most of the game. Those who occupy large houses and give great entertainments, and indeed those who go to them, are actors, as it were, upon a stage, and are objects of study and topics of conversation to the multitude who look on. Many a woman has a notion that in London alone her daughter is likely to marry; so, poor fool, she is induced to add one more to the hundreds of persons who lead a life which has no attractions for them. If, however, she is obliged to stay at home, she indemnifies herself by finding out all she can about her bigger neighbours, and would haunt the area with the family cat could she pick up a little gossip. An eyewitness takes much less interest in a scene than the old lady to whom the story is told the following week. It is therefore a matter of general moment that the example set, and the standard reached, by London society should be as high as possible. There are great ladies left among us, but they have not the same influence as of old. They remain untouched by the stream of vulgarity which sweeps past them, but they are powerless to stem it. The number of hostesses who shut their doors to mere plutocrats is becoming smaller. If the cook is good who dishes up the "côtelettes aux larmes de veuves" and the "potage aux cris d'orphelins," very few will inquire whence came the money to pay for the services of the chef. The O'Mulligan is there, and he shouts out, as of old, "The champagne is good in this house"; and if that is the case why should anybody make a fuss about abstract qualities? It is surely a weak point in the novel of *St. Leon* to represent that adventurer as shunned by his friends and acquaintances on account of their suspicions of the source from which he drew his wealth. Were he now in London he might unblushingly give any account he pleased of his revenue. If he farmed a lodging-house in hell, and got a good dividend, the only difficulty would be to make a choice amongst those of his friends who would desire to be associated with him in the direction of the company. Fancy any London mother objecting to Peter Schlemihl as a son-in-law because he had no shadow. "A most estimable young man, my dear," she would say, "with a great deal in him. Ah! you have perhaps heard the story that he has sold his shadow to the devil for an immense fortune. Quite true; but, after all, in this foggy climate what a very useless thing a shadow is! and my Georgiana is a girl who can be trusted to make such an excellent use of wealth. Then I must say that his friend has behaved most handsomely in the matter of settlements, and the shadow will be lent my dear Peter at all the *leves* and drawing-rooms. So I really think people need not be ill-natured." Money must be obtained, and the chase after it is the most interesting of occupations. To think, to read, and to be alone, are the three pests to be shunned by those who go into the world, and those who wish to go into it; Solitude

is detestable; anything is better than your own company. Did your wife die last Sunday, your father on Wednesday, or was your husband divorced last month? Never mind, the milk is spilt; it is but part of nature's law that parents should die, and monogamy be in some cases insufficient, and you can get another husband or wife to replace the lost one. It would be a very different thing if the survivor had to be lowered into the pit in company with the dead, after the fashion of the country *Sindbad* visited. As it is, instead of two loaves of bread and a pitcher of water, dinners and balls are offered to the bereaved one, and by some people to appear in mourning at their houses is looked upon as a breach of good manners and an offence against society. A season is gone in a moment, and well-bred people should die, say in August, in order not to interfere with their relations' pleasures. To die at the beginning of a season is as inconsiderate an act as to be a long time in dying. In the next world there will be no giving in marriage, so all these tiresome *contreltemps* are only possible during quite a limited time. Trade, too, must be encouraged, and immoderate grief might ruin half Bond Street. Society would very likely be able to sleep a sound sleep and eat a hearty breakfast the morning before it was going to be hanged, but it would neither eat nor sleep if it knew that it was destined to spend the following day left to its own resources and alone.

THE SACRED WINDHOVER.

FALCONERS, who rank hawks according to their length of wing and the colour of their eyes, despise the kestrel as a counterfeit. His wings are long, as long as those of the noblest peregrine. His eyes are large and brown. His beak has the requisite notches. But he is not a falcon. He is not noble. He preys on mice and beetles, and even the all-slaughtering game-keeper spares him as perfectly innocent. People who care neither for falconry nor shooting like to watch him hovering in mid air, as if suspended by an invisible wire from the zenith. He has become a familiar and pleasing feature in our recollections of many an English landscape. He hovers over many a broad Yorkshire valley, many a dark Welsh lake, many a Devonshire glen. And for the English exile in Egypt the windhover forms a happy surprise. No book of travels he has read warned him that he would see it. Everything else is unfamiliar. The brown Nile, the low mud banks, the blue-robed women drawing water, the camels, the *Lallakes*, the tall palms, the sandy desert background—all are strange. Even the settled serenity of the pale blue sky, unvarying day after day, has, in its perpetual sameness, a quality which makes it differ *toto celo*, so to speak, from our English sky. There is something, then, delightful in recognizing as an old friend the little kestrel of our own air, hovering over a wide plain blue with lupins, or soaring above the highest cliff of the table-topped mountains, just as he hovered when we saw him last above a ploughed field in Sussex. To our eyes he looks noble, even though he lets the heavy kites chase him, and soars no higher game than a locust or a scurab. There is no region in the world, it is said, where the peregrine falcon is not found; everywhere he is, and everywhere he is scarce. But the windhover is almost as widely distributed, and in Egypt, at least, is one of the most common of birds. If we watch him closely while he sits for a few minutes on the pole of a disused shadoof, we observe that his plumage seems brighter than it is in England. The winter frosts and summer rains have not bleached it; but otherwise he is just the same. We cannot but wonder whether he finds times changed since the Tentyrites worshipped him and ate the Ombite who had eaten a hawk. Does he know that he is no longer sacred, except to a home-sick English invalid? and, as he rises in the air with a captured insect in his claw, does he look back longingly to the days when he had five hundred priests to wait on him and tanks full of young crocodiles to afford him musky entlets? The black and white kingfisher bores too, but only poised a few feet above the muddy surface of the stream. He does not soar towards the sun like the hawk, and, though *k. vishers* must have been as common of old as they are now, we do not meet them in the sculptures, where the hawk is always present. That he is the self-same bird we never doubt. Was he not immortal? who, indeed, until rifles were invented, could hope to shoot him? When the ancient Egyptians worshipped him it was as a fitting emblem of immortality.

Among the most marvellous examples of ancient art in Egypt is the shrine of the sacred windhover at Edfou. The temple is one which until lately was buried under a hill of crude brick and sand, covered with filthy huts, and surrounded with the narrow lanes and bazaars of a Fellah town. But the sand has been cleared away, and the whole temple, perfect in all its parts, has been laid open. To approach it from the river there is a walk of a mile through cornfields, the lofty pylons towering full in front above the stunted minarets of the mosques and the chimney of a neighbouring sugar factory. The path winds to avoid watercourses, and it is long before we seem to get any nearer our object. At length we cross a wide canal in whose half-dry bed potters are busy with their primitive wheels, and women are gossiping round the mouth of a well, from which they draw water with a rope like *Dalilah's* of green withes. Then the town must be traversed, with its awful smells—smells more awful for the scorching sun, the blinding dust, the swarms of black flies, the unceasing cry for backsheesh, and the fierce mangy dogs over which unwary people stumble. In one little square half-way up the hill a few

men sit on heaps of sugar-cane, watched by hungry-eyed children. At the next corner there is a crowd of women, half hidden in a cloud of dust, who dance in a circle and cry and beat a tambourine, for some one has died, and the corpse lies within that low, doorless doorway. At length the pylons are reached, and we have to descend a long flight of steps from the new level to the old. The temple has been often described. It is the most perfect in Egypt, and though it only dates from the Ptolemies, would be of hoar antiquity in any other country. But the shrine of the God is more ancient than the temple, and has had but little attention from travellers. Like a very large sentry-box cut out of a single block of blue granite, it is not impressive for its beauty, and requires a few minutes' contemplation before its size begins to tell on the mind. It is carved all over in low relief with hieroglyphs, which inform us that Nectanebo, of the thirtieth dynasty, dedicated it to Hor-hat. It is fully fifteen feet high, the chamber being nearly seven—a square space of polished stone, bearing still the marks of the bars which made it into a cage. Here in the darkness must many a captive kestrel have beaten out its little strength against the shining walls. How gladly would its divinity have been given up to soar once more in the clear air and hover again over the sandy hills or the smooth Nile. On the festal days its wings would be confined with what falconers call a "brail," made of golden lace but none the more pleasant on that account to wear—a kind of strait-waistcoat in which the visible representative on earth of Horus was carried forth in procession. The brail may be seen faithfully copied in the countless wooden hawk which, having once decorated mummy cases, are now in our museums. There must have been sacred windhoovers in many places besides Edion. There was probably one at Denderah, and another at Karnac. A granite hawk's shrine lies neglected in the streets of Cairo, where it serves during the day as a dust-bin, and during the night as a dog-kennel. Another has been made into a Christian altar at Philæ; for the degenerate Egyptians of the fifth century, though they could not quarry the granite rock for themselves, were able to break the shrine in two and to incise a shallow cross on its side. Miss Edwards gives a vignette of this strange altar, though she fails to see its full significance; for she imagines that it is of limestone, and has not discovered its original purpose. The twice desecrated shrine has a peculiar interest for the Christian antiquary. It tells of a time the most obscure in the history of the Christian Church. It lies among the painted columns of a beautiful portico, which, standing as it does facing the south, has been made into a kind of aisled church, the eastern end being marked by the broken granite altar, and by a little ambulatory cut deeply into the wall through a layer of old gods and halfobliterated hieroglyphs.

The hawk's shrine at Philæ, in its second character as a Christian altar, is not more strange, however, than the figure of Horus himself in his Christian form. There exists among the uncatalogued treasures of the Louvre a small stone statue, carved in a late and barbarous age of Egyptian art, in which the god on horseback killing the dragon Typhon is represented in such a way that, as M. Clermont-Ganneau observes, if the head of the figure had happened to have been wanting, we might have supposed it a figure of St. George. But fortunately the head is not wanting, and it is that of a kestrel. This singular piece of sculpture, and a bronze in which Horus appears in the armour of a Roman officer, afford intermediate links by which to connect the old myth of the hawk god and his combat with the crocodile and the comparatively new myth of St. George and the dragon. Mythologists throw in Perseus and Bagon, and many other personages in different parts of the world, to complicate the questions thus suggested. But it is worth while to note, as any Egyptian traveller may do, the remains of the worship of Horus among the modern Egyptians. As he passes Bibbeh, a village on the western bank of the Nile some eighty miles above Cairo, he may visit a Coptic church, where, under the name of St. George, a hero of the Moslem as well as the Christian, he is venerated, a "sheikh" of such power that the Arab sailor thinks it no sin to recite a prayer before his likeness, and to contribute a few small coins towards keeping up the lights in his sanctuary. Girdhis is not uncommon even now as a Mahometan no less than as a Christian name. The compiler of *Murray* well remarks that, though Copt and Moslem alike believe in St. George, it would be difficult to persuade them that he is the guardian saint of England; and he might have added that it would probably be still more difficult to demonstrate to the modern Egyptian that, in venerating this saint, whom even Roman Catholics have, we believe, given up, he is continuing the worship of his forefathers thousands of years ago. One of the oldest of the inscriptions lately deciphered calls the Sphinx "Horem-Khoo," the Sun in his resting-place, symbolizing the first syllable by a hawk. A hawk in a shrine is the symbol of Athor, the goddess of beauty. Everywhere, in fact, in the old carvings does the same image occur. A hawk with outspread wings hovers over the door of every temple. He represents the sky on the lid of every sarcophagus. Sometimes he stands for a letter, sometimes for a syllable, sometimes for Horus himself. Gigantic hawks in granite, bronze hawks with the mitre crown of the Pharaohs, hawks in gold, silver, enamels, and precious stones, are in every museum of Egyptian antiquities; but, though no recollection of Egypt as it is can be considered complete without the windhover suspended in the blue sky, he eludes the grasp of the artist, like a spirit, everywhere visible, but as impossible to paint as the wind itself upon which he floats.

GHOSTS IN MEDIEVAL SERMONS.

THE *Mémoires de l'Académie des Inscriptions* is not exactly the work in which one would naturally look for ghost stories. It has struck M. Hauréau, however, the well-known historian of scholasticism, that ghosts are by no means things outside the pale of science. He has therefore made and published in the *Mémoires* a collection of the bogies that he has met in the manuscript sermons of mediæval divines. The anecdotes cast some light on the workings of the human mind in the middle ages; they illustrate the action of the myth-making faculty, and incidentally they may amuse the unscientific reader. It must be said that the ghosts of the preachers are, as a rule, rather edifying than terrible. There is no more "fearful wild-fowl" than your ghost; and ecclesiastics soon found that he might be employed to point a rousing moral as well as to adorn a tale. The method of using the spectre was perfectly simple. After denouncing in his best style some particular vice—for mediæval preachers did not deal in generalities—the orator would introduce a story of an apparition who had revisited the world merely to denounce the sins he had been inclined to. Thus there is a certain monotony in these moral tales, and the ghosts of the pulpit were as like each other as the spectres of modern magazine literature. Passionately to admire, and at the same time to mistrust and even curse, science was one of the habits and standing contradictions of the middle ages. Knowledge was even more attractive then than it is now, because knowledge was a forbidden and unholy thing. Preachers introduced many ghosts of distinction to prove the vanity of science and the necessity of a life of pure devotion. Thus Aristotle was said to have appeared after his decease to a favourite pupil, who, far from being alarmed, caught at the chance of profiting by any metaphysical advantages which the philosopher might have enjoyed in the next world. "Master," said the disciple, "what is genus, and what is species?" "Brother," replied Aristotle, "that is a question of no importance. Ask me rather what it is to suffer and not to suffer—non est querendum quid genus et quid species, sed quid poena, quid non." On his deathbed Aristotle, according to the preachers, had given promise of this pious state of mind. His disciples crowded round him, and bored him with questions as to those abstruse points of doctrine which vexed the scholastic intellect. The philosopher only replied, according to Jean d'Aunay, "Into this life I entered in fear; I have lived in trouble; I depart in darkness." The moral was that logic was a perilous study, only one or two steps removed from necromancy and the black arts.

The legend of the ghost seen by Master Serlon, an English scholar, has almost the same application. Serlon's was a very favourite spectre in the dark ages. The story is told first in a sermon by Eudes of Shyrton; many commentators on Dante repeated it of Siger de Brabant, who lived long after Serlon. According to Robert de Sorbon, Serlon was a contemporary of St. Bernard (1091-1153). M. Hauréau thinks he lived somewhat later; and, indeed, from other evidence it seems that he was one of the philosophers who were terrified into silence by the reaction which had vanquished Abelard and Gilbert de la Porrée. These dates are worth considering, because this legend is an example of the usual growth of a myth from the indeterminate to the definite stage. Stories of a certain sort are anonymous at their first appearance. Fairy tales or *märchen*, for example, always deal with nameless princes in nameless lands, at the epoch called "Once upon a time." It is later, when they become full-blown myths, that they are attached to some real or semi-historical character. We find in the adventures of the heroes of Greek mythology that the old anonymous stories of fairyland are fastened to distinguished names; and, again, a great personality like that of Buddha draws into its legend all manner of floating *märchen*. A rather coarse anecdote about an American general has been traced through Rabelais to the time of Edward IV., and through a MS. in the library of Tours to a certain Hugues le Noir, at the court of our King John, where the venerable jest is lost in the mists of the anonymous. Now the ghost which Serlon saw was anonymous in the time of William of Malmesbury, which tallies almost exactly with that of St. Bernard. William of Malmesbury says the event happened about the time of the war of Maine (1060-1063), and he localizes it in Nantes. According to him there were two clerks "in literature so instructed that they wanted little of perfection." They made a compact that he who died first should appear to his friend within thirty days and tell him whether the Platonic or the Epicurean theory of the future state of the soul were correct. Soon after one of the two expired by a violent death. More than thirty days passed, and the friend had ceased to hope for any special information, when the dead man "suddenly stood before him when awake, and busied on some ordinary matter." The spectre explained that he had previously been detained by circumstances, and then, stretching out his hand, let fall three drops of blood on the brow of the other, where they burned a mark which never was effaced. The ordinary moral advice was then given by the ill-fated spirit. This version of the anecdote is certainly earlier than that which Eudes de Shyrton introduced into his sermon. According to Eudes, Master Serlo made the usual contract with a friend, who died, and afterwards appeared in a parchment cloak, covered within and without with the finest writing in the world. Being asked how he fared, he said that the cloak, which he was condemned to wear for his delight in logic, weighed more heavy than lead, and

scorched like fire. Then he held out his hand, and let fall a drop which burned Serlo to the bone:—

And for ever more that master wore
A covering on his wrist.

Just so, according to Dr. Henry More, "one took a relation of Melancthon's by the hand, and so scorched her that she bore the mark of it to her dying day." Before leaving Serlo, it may be observed that later preachers knew much more about his adventure than Eudes de Shirton, who again knew more than William of Malmesbury. They would have it that it was in the park of St. Germain that Serlo saw the ghost, and that he rushed in a great fright into the cell of St. Bernard, saying,

Linguo coarctatus, era corvis, vanaque vanis,
Ad logicam pergo que mortis non timet ergo.

These verses were long popular. In 1627, when John Prideaux, afterwards Bishop of Winchester, was resigning the position of Vice-Chancellor in the University of Oxford, he repeated, amidst great applause, the lines attributed to Serlo. The *vogue* of the story in its various shapes, especially in that given by William of Malmesbury, is an odd example of the persistent scepticism and superstition of the middle ages.

Many of the ghosts in the sermons were said to be expiating comparatively trifling sins of omission. The spectre of a priest of Sens reported that many ecclesiastics in purgatory were burdened with heavy sacks full of the fragments they had dropped out of their hurried services. Some days after the death of Séverin, Archbishop of Cologne, a young clerk was crossing on horseback a ford near the city. Suddenly his horse shied and stood still, as horses and dogs still do in ghost stories. Immediately the apparition of Séverin appeared, and confessed to the clerk that he was expiating his fault of cutting short his devotions every morning that he might have more time to give to public business. We do not remember before to have heard of a troubled spirit which was able to manifest itself in the midst of a running stream. Other preachers altered this story, and spoilt it by making the Archbishop appear in the centre of a cloud of fire. Additions of this sort are seldom improvements, demanding as they do too much from the imagination of the audience. Writers of sermons made the common mistake of piling up horrors too high, and of introducing them on slight occasion. The enemy of mankind, for example, is brought in to make a dying nun confess that she is suffering agonies because she had enjoyed personal property to the extent of one thread of silk and a needle. The evils of ecclesiastical ambition are demonstrated by the ghost of a hermit who had once thought, like Bertie Stanhope in *Barchester Towers*, of being a bishop, but who had failed, and had retired in remorse to the wilderness. His brethren heard no more of the solitary till after his lamented decease, when he appeared, all radiant, to his bishop. The bishop was anxious to hear the tale of his experiences, and the ghost declared that he had died exactly at the same moment as three thousand other Christians. Of the three thousand he and Bernard Abbé of Clairvaux alone escaped purgatory; the fate of all the rest does not bear to be dwelt upon. This homily is scarcely consistent with the account given in another by a preacher who must have been a strong partisan of a certain doctrine which St. Bernard opposed. According to this orator, the spirit of the great saint was marked by a black spot, just as the ghost of a monk who had given a pair of old shoes to his poor father appeared all brilliant with the exception of the feet, which were black and unseemly. He ought to have restored the old shoes to the convent when he got his new ones, and he had, on the contrary, sinned by yielding to his natural affection.

The stories which are pure inventions have none of the interest of popular traditions wrested to an edifying purpose. At best, the invented ghost stories enabled the preachers to rebuke without risk the sins of ambitious and worldly priests and of political archbishops. Occasionally a mere secular anecdote of a certain sort served the purpose. Thus Jacques de Lausanne has preserved a rather bitter anecdote of a courtly and dissolute ecclesiastic to whom a royal patron had promised a bishopric. When a vacancy occurred, some other candidate was elected; and the priest who had looked for the place complained to his patron. The answer was:—"I did not mean to take any trouble about the matter, because I knew that the worst men were always elected, and I sincerely thought that you were the greatest scamp eligible. They seem to have discovered a still more flagrant reprobate; but, if you persevere in your present courses, no doubt you will die a bishop." It will be noticed that this tart reproof was perfectly safe, for it was put into the mouth of a king. Now kings and ghosts in the middle ages enjoyed the license ascribed by Mr. Tennyson and Mr. Roebuck to the modern natives of this island:—

Where, girt with friends or foes,
A man may speak the thing he will.

What ghosts said were always privileged communications. If a preacher wanted to malign some great man lately dead, he had only to declare that his spirit had appeared, like that of Philippe de Grève, mentioned by M. de Launay, and had confessed the practice of all sorts of enormities. Philippe de Grève, for example, held unpopular views about pluralism; but there is apparently no evidence, except that of his ghost in a hostile sermon, to show that he was a man of abandoned character in private life. Perhaps, if it had never been revealed to the Bishop of Orleans that the body of Charles Martel was "visibly taken from his tomb by evil spirits in open day," we should know less of the offences by which Charles incurred this dreadful doom. And even the "excessively gluttonous" old

woman of Berkeley might have left a respectable reputation or none at all had not William of Malmesbury extracted, probably from a sermon, the story of her disappearance on the back of a black horse, and in the arms of a fiend "of more terrible aspect than the rest." It is the same writer who, after observing that it is "better to dwell on such matters than on Ethelred's indolence and calamities," introduces the Saxon story of the men and women who were compelled by miracle to dance for a whole year in a churchyard. This legend was circulated to discourage secular festivities at Christmas; and it is not absolutely impossible that the excellent story of Glam the Vampire, in the *Grettis Saga*, was invented to show what people might expect who would not fast on Christmas Eve. But it is never easy to distinguish between the legends made up to enforce opinions and the older popular traditions which have been altered to serve the purposes of the preacher.

UNIVERSITY VACATIONS.

BOTH in Parliament and in the Universities there have lately been not wanting signs that the most cherished of all University institutions, the Long Vacation, must consider itself upon its trial; and to-day, when it begins, seems a good occasion for asking the question, what there is to be said for and against it. It is certain that the House of Commons—a body which itself sits for barely five months in the year—looks upon the Long Vacation with suspicion, and there was a singular unanimity among the speakers who supported Mr. James and Mr. Gregory in their attempts to give special curtailing powers in this respect to the Commissioners. It is certain, too, as has lately been pointed out with a good deal of bitterness in the Oxford Congregation, that at least one great authority within the University is for introducing the thin, or perhaps the thick, end of the wedge in the new regulations about the teaching of Indian subjects. On the other hand, the defenders of the present division of the academical year are collecting their forces. Honest and dishonest supporters of its utility, the genuine student and the selfish lover of ease, are rallying to their posts; and the Commissioners may be well assured that, even if powers for re-arranging the Terms are given to them, they will have to reckon with a determined opposition should they attempt any very large alteration.

At present, as is well known, Oxford and Cambridge have three terms of eight weeks each, which for Tutors and Examiners often extend to nine or even ten weeks. At Cambridge a "Long Vacation Term" of two months, during which men may come up for independent study, is a recognized institution; at Oxford one or two Colleges have lately tried the same plan with moderate success. The three vacations are a month at Christmas, a month at Easter, and four months from June to October. If we ask how the time is filled up during Term, we are naturally met with an answer which will differ according as we apply to the Passman, the Honour-man, or the Tutor. The first will probably reply that his life has been latterly made a burden to him by "harassing legislation," that the prospect of a School to pass at almost every term's end during his career is a prospect whose grim outline is never absent from his thoughts. An eminent statesman has lately charmed his own wavering constituency by a vigorous depreciation of the Oxford degree; and no doubt the majority of young men, whether belonging to the University of Oxford, or of London, or of Berlin, are neither geniuses nor bookworms. But if Mr. Lowe had taken the trouble which might have been expected of him, and had reasoned from an observation of the present rather than from a distorted recollection of the past, he might have found himself forced to represent both facts and motives somewhat differently. He might have discovered that at Oxford, as elsewhere, the coat is cut according to the cloth, and that the examinations represent not the minimum, but the maximum, that can be got out of the ordinary examinee. As a matter of fact, the amount now required for the degree is great enough, in ordinary cases, not only to fill up the reasonable working hours of the term, but to overflow into the vacation. A man who succeeds in his classical "greats" at Midsummer, and who hopes to offer Political Economy for his "second school" at Christmas, has far more on his hands than he can manage during the few weeks of the Michaelmas term. He takes his Adam Smith and his Fawcett home with him, and works his way through them, in the first instance, in the bosom of his family. As to the Honour-man, his case is even simpler. The examinations decide his line of action for him, and the examinations require two distinct kinds of qualification—a minute knowledge of certain text-books, and a careful preparation in various subjects lying around and about them. With this end a wise man divides his work as much as possible on the principle of going to lectures and writing essays during the term, and reading his books during the vacation. How many a man is at this moment gorged to repletion with the ideas and concentrated schemes of history and philosophy that have been poured into him by half-a-dozen clever lecturers, and is pining for the vacant months in which he may digest them! During the rush and hurry of Term, with its succession of elaborate lectures that had to be noted and copied out fair, its essays that had to be written to time and corrected and remembered, Thucydides and Plato were crowded out. The man whose work has really interested him looks forward to the Long Vacation with a genuine delight. It is not only the time of freedom; it is the time

when his ideas are to receive order, and substance, and settlement, from a quiet "grind" at his books.

The Tutor is really in just the same position. For him, too, the Term is a period of hurry, of distraction, of shipping from subject to subject, from teaching to administration and back again. For it must be remembered that the College Tutor is not merely a teacher. As Fellow he has to take his part in a great deal of College business, which in these days of transition and Commissions is no light matter; and he is lucky if he is not called upon to take part in heavy University business too. There is Congregation once or twice a week; and of late especially, though the debates are not reported at great length, they have sometimes reached a truly Parliamentary pitch of warmth, interest, and even length. Again, the Boards, such as the newly-established Boards of Studies, are institutions which make a heavy demand upon the time of many of the Tutors. Critics of the Universities should recollect, in fact, that very much of the work that in other countries devolves upon the Ministry of Education is done in England by unpaid Delegates or Syndicates in the Universities—Committees which are increasing in number almost annually. With these growing administrative burdens there is certainly no diminution in the tutorial work, properly so-called. Combination, it is true, has done something of late years to divide labour, and it is now a rare thing for one man to lecture on all the subjects of a School. If he undertakes philosophy, he generally leaves history alone; if he teaches scholarship or law, he keeps to two or three books or departments. But it is only natural that with this division of labour there should grow up a demand for improved quality in the work done. Healthy competition has done wonders in this way, and a lecturer now feels it impossible to stand up and talk platitudes, or merely repeat the notes of some well-known editor, or accept a course without sharply criticizing it. It is hardly possible, for instance, that in lecturing on the *Politics* or the *Annals* he could keep up with his fellow-teachers, or keep ahead of his pupils, unless he has read what the Germans and the French have lately said on the subject. And this brings us round to the starting-point. How is he to prepare his lectures except in the Long? As his work is different from that of the schoolmaster, which demands indeed great assiduity and energy, but not much preparation, so his vacation is different from the schoolmaster's holidays. Suppose he takes a month in Switzerland for his body's health, are the remaining three months too much for the undisturbed possession of his soul that must precede any satisfactory deliverance in the autumn? For it must be observed that most courses of lectures in Oxford are calculated to last a year—say from fifty to seventy lectures—in each one of which the teacher is expected to say something new and true. And although the work seldom receives its final shape during the Long, it is in the Long that the foundation is laid and the outline drawn.

It is no doubt true that in many cases—say in most cases—the British parent finds the vacations too long for his comfort, and is sadly at a loss to know how to keep his son out of mischief all through them. But he must not suppose that the remedy is simple, for that it would be altogether agreeable to him. Even admitting that a vacation which probably in its origin arose out of the need of sending the lads home for harvesting has lost that *raison d'être*, the parent must not forget that longer residence at Oxford and Cambridge means larger bills. The tradesmen of the town might, no doubt, in consideration of a prolonged season, make their charges something less excessive; and Colleges for a similar reason might find it possible to accommodate men for another two months at an increase less than proportional; but the Tutors, who regard the Long Vacation as the main inducement to stay at the Universities, would not consent to forego it except for a consideration. The Tutor has, generally speaking, been one of the crack men of his year; his contemporary first-class men are rising barristers, schoolmasters in a fair way to a great income, or flourishing men of business. He is not likely to be content with his five hundred a year, and his exceedingly doubtful prospects, unless some of the charms of studious ease are left him. Parents must be prepared, if the vacations are narrowed, to see a sudden rise in tuition fees; thirty guineas instead of twenty will be the normal standard. If they are willing to meet this, then no doubt something may be done towards keeping their sons at Oxford or Cambridge for more weeks than is now the case. But, as we have said, the Commissioners, or any other reforming body, would find it very difficult to carry a measure which did not leave, say, three weeks at Christmas and Easter, and three clear months in the summer and autumn.

YACHTING

THE sport of yachting, like that of racing or hunting, is affected by an infinite variety of patrons. Just as the part owner of a plater glories in his dignity as a racing man, and the gentleman who occasionally hires a screw for an suburban gallop classes himself in the hunting confraternity, some of whose members count their studs by the score, so there are yachtsmen with cock-boats of two or three tons whose crew, when all told, is one able-bodied man and a boy. But in the case of yachting we believe that these modest people have very often the best of it. We may take it for granted that they are enthusiasts, and without enthusiasm yachting is vanity, vacuity, and vexation of spirit, if not positive misery. We may be sure, too, that they are blessed with the

physique and stamina which make them very independent of the weather. A wild outbreak of the elements rather freshens them up than otherwise; they shake themselves cheerfully like a waterdog after a drenching from surf and rain; the strength of their internal construction is proof against external disturbance. When their craft is careering before the freshening breeze, their spirits rise with the exhilarating motion; pitching in heavy cross seas merely grinds a sharper edge on to their ready appetites; and even rolling hopelessly in a heavy swell barely deranges the serenity of their diaphragms. They have a stock of patience and natural cheerfulness, or they would never have taken to their favourite pursuit; and, unlike the sea stories which have to be perpetually replenished, the stock is only increased by trading upon it. Then, if they have a minimum of those luxuries which they take a pride in dispensing with, they have likewise a minimum of the yachtsman's cares. They have no sailing-master to dictate to them and domineer over them; no crew to get mutinous or troublesome in a life of indolent semi-occupation. They have been casting about for a suitable companion in their adventures, till at length they have chanced upon a congenial spirit; since it is comparatively easy to suit yourself with a single hand, though difficult to ship a comfortable ship's company. They attend in person to the needs of the commissariat, and that is not by any means the worst part of the fun. There is no great stowage-room in the tiny lockers of the little half-decked cabin; and the victualling is something on the scale of Robinson Crusoe's when he ran away from his Moorish master with the boat and the boy Xury. There is a junk of beef and a bag of biscuits—somehow salt beef and ship biscuits have always a singular charm for the hardy mariner—a jar of water to do the cooking and mix the grog, for which last there are ample materials, for your yachting enthusiast, though he may be temperate enough, is never a teetotaler. As for milk and vegetables, draught beer, and delicacies of that kind, you renew them at the ports at which you may touch in the course of the voyage. For our friend very likely goes on regular cruises, in which he may see at least as much of the world as many of his more ambitious brethren. Most old travellers have come to the conclusion that the secret of profitable touring is working well within your time, and doing a little quietly and thoroughly. So our friend, in place of running across for some hundred miles between sea and sky to some commonplace port on the Continent from which he turns to run back again, gives himself up to a leisurely exploration of a reach of the English coast. By experience as well as from a study of the charts, he is familiar with shoals and currents, though sometimes his trusting to his light draught tempts him to make reckless experiments. Then he may find himself hard and fast upon a mud-bank, where he has to await the mounting of the following tide. What of that? Inaction is doubtless a trial to his energy, but he is used to taking the smooth with the rough; and, what with the help of a hook and his pipe and his fishing-lines, he passes the hours not unprofitably. Then he beats along under bold cliffs and headlands, drawing near enough to the beach to appreciate their grandeur; he watches the flights of sea-fowl that circle screaming between him and the shore, with the choughs and rabbits on the face of the rocks, popping in and out of their breeding-holes and burrows. He sails up tidal estuaries, between half-submerged sweeps of sand or mud, alive with clamorous waders and divers, to land at the barrack-covered jetties of quaint, old-fashioned fishing-towns, picturesque in their slow decay. He strikes up acquaintances with local worthies, to whom the arrival of the distinguished stranger is an event; and goes on board again at nightfall to turn in and curl up with a feeling of fresh sensation that seldom comes to one in a steam-packet or a railway-carriage. But it is by no means his weakness to hug the shore, or to drag out a cautious coasting voyage Ulysses-fashion. On the contrary, he loves to run a respectable chance of being reported missing some stormy day; and sometimes stands across the bay or out to sea in weather that would make older mariners shake their heads. But he has well-grounded confidence in the qualities of his cockleshell as a sea-boat; Providence seems generally willing to lend a helping hand to nerve and skill; and somehow such haphazard gentlemen seldom come to serious grief, although very often they have narrow escapes from it.

We are very far from saying that there are no delights in the more luxurious forms of the pursuit. To say nothing of the excitement of a neck-and-neck race, when some half-score or so of famous "cracks" are heeling gracefully over to a swelling breeze, steadied by the clouds of billowing canvas, and showing those delicate lines on the bends which may make the difference between defeat and victory—to say nothing of such a spectacle as that, who has not felt admiration, or even envy, in threading a fleet of yachts in the Solent? It needs no knowledge of naval architecture to appreciate the graces of their shape; and the cut of the canvas is like the dress of a fashionable beauty when the fashions of the day chance to be in harmony with nature and common sense. There is the lightest of breezes, and the motion is gentle rather than free; but to you who probably are no great sailor, and who have just passed the night in a racking ground-swell on the Channel, that rather adds to the agreeable impression. You remember that the fortunate owners of those marvels of marine coquetry can ring fresh changes on the pleasures of society ashore. In summer, when the land-locked seas are calm, they can enjoy all the pleasures of floating picnics, limiting the numbers of the parties which they ought to know how to arrange, and leaving formality and ceremony ashore. Nor need a longer trip be anything but a social success, though a

break-up of the weather or even a sudden squall may turn enjoyment into dire confusion. There are as many meals as one always has at sea, more delicately served and abundantly varied than in commercial steamers. There is a cellar of such vintages as can bear shaking. There are well-drilled stewards and attentive valets, snug bedsides, well-ventilated cabins, and airy bath-rooms, a piano, books, and all the rest of it. Gentlemen of roving tastes who are so happily provided will naturally sometimes push their expeditions further. It is something to moor your own floating home with your family and your friends and your English comforts in the Fjords of Norway, where hotel accommodation is decidedly deficient, or among the Isles of Greece, where it is conspicuous by its absence. But in the bustle of travel nowadays the Levant and the Adriatic appear to be brought by comparison close to our doors. No doubt the scenery there is fine, and the appearance and manners of the natives are picturesque; but so they are on the Caledonian Canal, or in the archipelago of the sea of Morbihan. Ambitions have expanded with increased facilities. Travellers with means and leisure take through tickets by ocean steamers and inter-oceanic railways, making the round of the earth in the course of a summer holiday, and rapidly doing all the world's modern wonders. The man of spirit and intelligence, yacht-bound in European seas, must fret over what he is missing—the money-hunting mobs of Broadway, the waterfalls and big trees of the Yosemite Valley, the sea lions of San Francisco, the volcanoes of the Hawaiian group, Yokohama, Shanghai, Singapore, &c. &c. Hitherto he has had to choose between deferring the circuit he has long been dreaming of, and laying up his vessel in ordinary for a season. But now Mr. Thomas Brassey has set an example which others of his amphibious countrymen will probably follow. Mr. Brassey had already distinguished himself by passing the highest examinations in practical seamanship, and sailing a yacht of his own across the Atlantic. And now he has circumnavigated the globe in his *Sunbeam* with complete success and extreme enjoyment. He may well remark that the exploit “is in some respects unprecedented,” since he traversed nearly 36,000 miles in 46 weeks, allowing for 112 days in harbour. It is true that, to get the most out of so adventurous a trip, one ought to be as thorough a seaman as Mr. Brassey. “The long and lonely voyage of 12,330 miles across the Pacific” would become even duller than it must be almost necessarily had you to subside into a passenger on board your own ship, with only your family party for society instead of a mixed multitude. And the voyage was really yachting in the stricter sense of the word; for, though the *Sunbeam* is fitted with an auxiliary screw, for considerably more than half the distance she was under sail. Although her captain, fortunately for him, has the means which enable him to yacht in princely style, yet he undoubtedly belongs to the class of enthusiasts whom we have described as going to work in the rough. We suspect that, had it not been for domestic considerations, he would have been just as well pleased had there been more opportunities for the steam-schooner to display her weatherly qualities. As it is, he can sum up the gales he experienced in a very short paragraph. He can say that most of the difficulties he anticipated shrunk in reality into comparative insignificance. Thanks to the screw, they had never to resign themselves to being becalmed in the narrow seas of the tropics; so steam enabled them to dispense with the drudgery of the voyage, and avoid the baffling weather of such a headland as the Horn by carrying them smoothly through the Straits of Magellan. Thus, though they were always under sail when practicable, yet they were able to make their successive points with something like commercial precision; an important consideration to a useful member of Parliament, in these days when constituencies are so exigent.

Mr. Brassey remarks gratefully on the facilities afforded to the navigator nowadays, as contrasted with the inevitable dangers and delays that beset him in the time of Captain Cook. Now improvements in the chronometer enable one to dispense with those lunar observations which were always precarious and often unsatisfactory. Now the perilous coasts that used to be shrouded in darkness in the night-time are as brilliantly lighted as those of England and France; while, in place of groping your way among reefs and currents, listening for the warning sound of the breakers, you may be guided through every stage of the journey by carefully drawn charts which leave little to desire. It may be expected that Mr. Brassey's voyage round the earth will open up a new era in yachting, for English gentlemen with energy and leisure will be sure to follow him in the track he has piloted.

THE END OF CARDINAL MANNING'S TRUE STORY.

IN the June number of the *Nineteenth Century* Cardinal Manning has at length brought his “True Story of the Vatican Council” to an end. It was once said of a more than indifferent preacher that the most edifying passage in his sermon was his passage from the pulpit to the vestry. And we are inclined to think that the Cardinal's readers will, on similar grounds, pronounce the last passage of the remarkable narrative with which he has favoured them to be the best. “And now,” concludes his Eminence, “we may leave the story of the Council.” It was time certainly to leave “the story,” for there had been quite enough of it: But it still remains for future writers, when all the documents, as well private as official, shall have become accessible, to begin the history. As to mere statement of facts the little recorded in this last instalment of the

“True Story” was for the most part well known already, and may be read in the *Letters of Quirinus* and elsewhere. The real purport and drift of the paper is to be sought in the peculiar colouring given to the facts. But, before entering on points of detail, we have a word to say on an ingenious analogy which the writer, who is enough of an Englishman and a man of the world to know what line of argument is likely to sound plausible to his countrymen, is very fond of dwelling upon. He had before insisted that there was as much freedom of discussion in the Council as in the British Parliament, and here again we are significantly reminded that what ten bishops could do there “any single member of our Legislature may effect” by putting to the vote whether a debate shall be closed. And the supposed analogy between the two assemblies is driven further home in a subsequent passage by an express reference to “a certain debate on the 23rd of March in this year, 1877, when the majesty of the Commons of England lost itself in clamour, chiefly because a majority declined to let a minority have its way.” “Because a minority insisted on making itself heard” would perhaps be a more accurate description of what occurred at Rome, but let that pass. The parallel intended to be drawn is between the anti-infallibilist minority in the Vatican Council and the minority in the English Parliament who dissent from the Eastern policy of the Government, and it is implied that the former were treated with more rather than less consideration than the latter. A moment's consideration will suffice to show that this reasoning, however plausible, is based on a transparent fallacy. Let us assume, what is probably the Cardinal's own view, that what may be called for convenience sake the Gladstonian party on the Eastern question in Parliament or in the country is as entirely in the wrong as he certainly considers the anti-infallibilist party at the Vatican to have been. Yet there is no real analogy whatever between the two cases either as regards the nature of the dispute or the treatment of the disputants. Not as regards the nature of the dispute, for the question at stake in the one case is *ex hypothesi* an article of divine and immutable faith, which the Council was called upon to settle once for all irrevocably, and where a wrong decision would affect the faith and conscience of the Church for all future ages; whereas in the other case it is a question of practical policy, in which from the nature of the case the will of the majority must ultimately prevail. But in the next place neither the Government nor its most thoroughgoing supporters ever dreamt of treating the Gladstonian minority as the Papal majority and Church treated the minority at Rome. If they are beaten in Parliament no one questions their right—whatever he may think of the expediency of such a course—to use every effort to rouse the country and bring such pressure to bear on the Government as shall compel it to retire or adopt a new policy. In other words, it is always open to a minority in English politics to appeal from the present to a future Parliament, and this has over and over again been done with entire success. But this is precisely what the Vatican minority, who found the debate on infallibility abruptly closed without their consent and against their will, were not allowed to do; their choice lay between speaking then and holding their peace for ever afterwards. Cardinal Manning himself would have been the first to tell them that to appeal to a future Council is heresy and treason. Indeed in this very article he severely censures “Pomponio Leto” for treating the minority Bishops like “a Parliamentary Opposition.” Be it so; but he cannot blow hot and cold together. If the nature and functions of an Ecumenical Council differ so entirely from those of a British House of Commons that what is perfectly lawful for the defeated party in the one case is only deserving of excommunication in the other, it is worse than idle to excuse the conduct of the dominant party in the former by analogies drawn from the latter. No purpose can be served by such adroit special pleading but to throw dust in the eyes of the British public.

And now it is time to give one or two examples of the writer's peculiar manner of dealing with awkward facts. He quotes in full the protest read out and distributed, as mentioned by Quirinus, at the closing Session of the Council on July 13, in which the following passage occurs:—

The infamous falsehoods which have been heaped together in this matter in public newspapers of every tongue, and in pamphlets without the authors' names, published in all places and stealthily distributed, all men well know, so that we have no need to recount them one by one. But among anonymous pamphlets of this kind there are two especially, written in French, and entitled *Ce qui se passe au Concile*, and *La dernière heure du Concile*, which, for the arts of calumny and the license of detraction, bear away the palm from all others.

As to the words we have italicized, the reason why publications on the opposition side were “published in all places and stealthily distributed,” was simply, as Cardinal Manning must be well aware, because the rigorous police regulations of the Pontifical Government made publication in Rome impossible, and even private distribution difficult. But as to the two particular pamphlets which “for the arts of calumny and license of detraction bear away the palm,” our readers may recollect having heard something of their contents and authorship before. The Cardinal's comment is studiously ambiguous. “Whether history will ever record by whose hands the works here censured by name were written cannot now be said. I am glad that it does not fall to my lot to reveal them.” This language is consistent either with his knowing or not knowing the names himself; but it is hardly conceivable that he should be ignorant of what has all along been matter of public notoriety. *Ce qui se passe* was written in France by a M. Guillard, a layman, acting under inspiration of some of

the French Opposition Bishops. *La Dernière Heure*, printed at Munich, had a more illustrious origin. Cardinal Manning has himself further on in this article pronounced on its author a panegyric which is strong but not at all exaggerated:—

The Archbishop of Paris [Darby] was a man of great culture and intellectual gifts. The playfulness of manner with which he bore himself towards those who were most opposed to him took off all sharpness from the conflict in which they were mutually engaged. We then little thought of the vision of horror in which he was soon to be enveloped, and of the death which should so soon be inflicted on him in *odium Christi*. His heroic refusal for the sake of others to save his life has raised him to the fellowship of those who have won a martyr's crown.

The same studied reserve is maintained as to the authorship of *Pomponio Leto*. The volume naturally incurs a bitter malediction in company with the "double-faced and double-tongued *Janus*," who "told the world what the Council would do"—and what, we may add, it did. But after a long tirade on the audacious dishonesty of various newspapers and periodicals, the *Saturday Review* included, which are accused of still speaking of it as the work of the late Cardinal Vitelleschi after his brother the Marquis had contradicted the report, comes the following enigmatical statement:—"As to the true authorship of *Pomponio Leto* various things are affirmed. It belongs to the anonymous school of *Janus* and *Quirinus*, and seems to be the work of more hands than one, and to betray both a German and an English contributor." Our own statement the other day, in commenting on a former article of Cardinal Manning's, was this:—"Pomponio Leto is the work of the Marquis Vitelleschi, and the reports of proceedings in the Council are derived from the diary of his brother, the late Cardinal of that name, who was present" (*Saturday Review*, March 10, 1877). Is Cardinal Manning prepared to contradict this? No hint of a contradiction has emanated from the Marquis Vitelleschi, and it is universally affirmed in Italy. The only "English contributor" to the volume is the English translator, who acted under the immediate sanction and direction of the author; the "German contributor" is a creature of the critic's imagination. Some evil genius must have prompted him, when deprecating the ascription of this work to Cardinal Vitelleschi after his death, to add with characteristic and suicidal infelicity, "Pope Honorius was declared to be a heretic forty years after his death." Has he forgotten that the declaration was made by an Ecumenical Council and endorsed by two later ones, and that it was based on the explicit statements of Honorius in writings the genuineness of which is unchallenged?

We do not question Cardinal Manning's right to take a brief, if he pleases, for the Curia and the infallibilist majority, but it may be doubted if he has any claim to hold a brief for the Opposition also. And it would certainly have been kinder not to have recalled attention by a terribly compromising defence to the evasions, insinuations, and tergiversation by which too many of them sooner or later condescended to escape from a very uncomfortable dilemma. Thus the late Bishop of Montpellier wrote a letter conveying the impression that he was not the author of some very trenchant letters on the Council which had previously found their way into the *Times*; but his language was so studiously ambiguous as to deceive those only who were willing to be deceived. We all know again how Ketteler and Hefele and Haneberg were ultimately brought to submission, but it is needless to go over all this ground again now. Cardinal Manning's object of course is to reduce to a minimum the actual opposition between the two parties, and to represent the minority as only resisting the dogma as "inopportune." An appeal to their own recorded statements and protests sufficiently refutes this view. When some concession becomes inevitable, it is minimized to the utmost, as *e.g.* in the following passage:—

But it may be said that they used their right too freely and with pertinacity when they saw, or might have seen, that an immense majority of the Council were opposed to them. It is not the duty of an historian to extenuate any fault, but he ought to be still more careful not to impute faults too readily. It is not to be denied that the Council—for by that term may rightly be described its great and united majority—judged that the privilege of opposition was used too freely in matters of an indifferent or unimportant kind, and that it was persevered in too long when it was evident that no legitimate result could be obtained. The Council saw, or believed itself to see, that after a certain date the inordinate prolongation of discussion could have no effect but to render the deliberation impossible, not by argument or reason, conviction or persuasion, but by the chapter of accidents or by talking against time.

That of course is just what a minority earnestly bent on defeating what they held to be a fatally erroneous procedure would do. The tumultuous disturbances in the Council, affirmed by *Quirinus*, *Pomponio*, and others on the testimony of eyewitnesses, are as far as possible denied, but here too some admission was felt to be unavoidable:—

On two occasions the speaker tried the self-control of his audience beyond its strength. Strong and loud expressions of dissent were made, and a very visible resentment, at matter not undeserving of it, was expressed.

This is only a mild way of indicating such scenes as are described in more graphic language in the *Letters of Quirinus*; thus *e.g.* after a speech of Strauss says:—"At these words a frightful tumult arose. Several dissenters rushed to their seats, rushed to the tribune, and shook their fists in the speaker's face. Place, Bishop of Marseilles, one of the boldest of the minority and the first to give in his public adhesion to Dupanloup's Pastoral, cried out *Ego illum non damno*. Thereupon a shout resounded from all sides, *Omnes, omnes illum damnamus*. The President called Strauss to order, but he did not leave the tribune till he had solemnly protested against the violence to

which he had been subjected. . . . A Bishop of the United States said afterwards, not without a sense of patriotic pride, that he knew now of one assembly still rougher than the Congress of his own country." After this, which is only a specimen of much more to the same effect, not to dwell on the ugly revelations coming from those immediately concerned of what took place outside the Council chamber, one reads with much edification, but not without surprise, that "it can be said with the simplest truth that not an animosity, nor an alienation, nor a quarrel broke the charity of the fathers of the Council." Truth indeed is said to be stranger than fiction, and the most ingenious fable could hardly match the strangeness of the Cardinal's "true story." He has probably gazed so long on his own picture that he has learnt to mistake it for the reality. But readers whose knowledge of the facts is not derived exclusively from the pages of the *Nineteenth Century* are not likely to share his delusion.

THE GOLDEN VALLEY.

THERE is sometimes this advantage in short casual holidays which are insufficient for extensive and distant excursions, that they lead one to discover pleasant sequestered places which would otherwise never be thought of. Such was certainly the case in a visit lately made to a valley on the border of Brecon and Monmouth, lying in the extreme west of Herefordshire, shut in on either side by ranges of hills, remote from towns of higher standing than Hay, and, though not unknown in other days, nor without hopes of revival from an expected railway, at present practically out of the world. We speak of the Golden or Dore Valley. The approach to this valley on the north is from the parish of Clifford on the Wye, about two miles short of Hay, on the Hereford, Hay, and Brecon Railway; and the pedestrian will do well to take this interesting parish in his ramble, although the river Dore, which gives the name to the district, does not rise till just above Dorston. In Clifford, or in Hardwick, a parish cut off from it to the south, is the small, but strong, camp or entrenchment of "Mouse Castle"; and Clifford itself has vestiges of a memory-haunted castle, the reputed birthplace of Fair Rosamond, as well as a church with some features of antiquity. The castle, high above a ford of the Wye on its right bank, explains its own name, and is one of the five Herefordshire castles in Domesday. Built by W. Fitzosborne, it was granted in 1078 to Ralph de Todeni, whose daughter Margaret carried it in dowry to Richard Fitzpoutz, the grand sire of Henry II.'s traditionally hapless favourite. Of Walter de Clifford, her brother, and his making the King's messenger swallow, seal and all, a missive from his royal master, and of the Cliffords and Giffards who came after him and were prominent figures in border warfare, as well as the custodians of the castle when it fell into the hands of the Crown, we cannot speak here; it must suffice to say that the site is a strong one, and that a fragment of the north wall and a round tower with splayed slits in its two stories, with an adjoining west wall, are the chief traces of what was the original castle. It overhangs a steep escarpment, beneath which the railway passes. The outermost ward of the castle may perhaps be traced in a field adjoining the mound, and it is clear that the fortress was surrounded to landward by a wet moat communicating with the Wye. Tradition says that there are vaults beneath the ruins, and that within the memory of old inhabitants a workman, pecking with a crowbar in the *debris* near the ruined towers, lost his tool through its being suddenly swallowed up bodily. The church, high on the hill, about three-fourths of a mile above the castle and village, has a large and not ill-proportioned tower, and its nave is barrel-ribbed; but there is little that is worth notice about the rest of the building, except a wooden effigy of an ecclesiastic, full length, robed, and tunsured, in the chancel, and a coffin-lid with a carved cross in a circle at the threshold of the north door. Nothing remains of the ancient cell of Cluniac monks which surmounted another brow of the same eminence as the church, except the so-called Priory, a modern residence, beautifully placed. In another part of the parish, accessible by a lane leading out of the high road from Hay to Bredwardine, and verging towards the Wye, are tokens of ancient military occupation on the farm of Castleton, once the property of the Duppa family—namely, a tumulus or mound, almost circular and very steep, in the direction of the river, whilst to the land side are two semicircular outworks, with a seeming way of access between them. Some traces of large stones remain, but scarcely enough on which to build even a theory; otherwise one might suppose that here might have been more than a mere earthwork—perhaps a castle with a keep tower on the mound to the north.

It is time, however, that we make our way towards the Golden Valley, and to do so we take the road from Hay to Hereford in the parish of Hardwick, having for our boundary to the west the Cusop Hills and the wooded eminences in Escley, and, over all, the Hatterel or Black Mountains; whilst towards the east the barrier from the world without is formed by the bold brow of Meerbatch, with its continuation named Graigwen, connected with which at right angles is Arthur's Stone Hill, a part of which joins on to Moccas Park. Further on, the Golden Valley has for its barrier on this side the wooded hill country of Tibberton in Herefordshire, and an effectual barrier it would seem to be, so completely are the two populations of the west and east at present

divided. To such as have the time to spare we recommend a visit to Arthur's Stone, both for its prehistoric and its historic interest, to say nothing of the glimpses it affords of Bredwardine, Moccas Park, Letton, and some of the most charming scenery of the Wye. Arthur's Stone, or "King Arthur's Table," as it is sometimes termed, is a large and singular British cromlech, the capstone of which, now broken in the middle, is elliptical in form, eighteen feet in length, nine feet broad, and some two feet in thickness. It was originally supported by eleven upright stones, some of which have fallen, and, with others, lie scattered round. There is also a small mound near it, and a larger stone than the majority of those round about is imbedded in the hedge. The purpose of this stupendous pile was doubtless sepulchral; but that which served for the obsequies of "some great chief without a name" was duly used by Charles I. in the Civil War as a rendezvous and trysting-place of the troops and contingents from the Hay and Dore country, and from Radnorshire and Brecknockshire. According to Symonds's Diary, published by the Camden Society, "the King was at the Bishops' Palace at Hereford on the 16th of September, 1645, and on the 17th the whole army met at a rendezvous upon Arthurstun Heath, near Dorston (Dorston) Castle, com Hereford, and from thence his Majesty marched to Ham (Holm) Lacy, the seat of the Lord Viscount Scudamore." It does not appear therefore consistent with the topography and the details of the King's marches that he can, as the Golden Valley worthies affirm, have come nearer to them than Arthur's Stone upon the hills above Dorston, and distant some three miles or more, though it is likely enough that, accustomed to border warfare, and not averse to occasionally breaking their normal bounds, they mustered strongly at Arthur's Stone in the King's cause. At the turning of the road to the left towards it through the valley are two huge stones, to which no story can be found to attach; but before reaching these occur two noteworthy objects a little to the left of the road—namely, Newton Tumulus, which was evidently an extensive and important earthwork, with the remains of a moat and of considerable polygonal outworks; and, a little further on, another tumulus at the Bach or Bage, of smaller dimensions, but strongly placed over a pretty brook and dingle, full of wild flowers—a feature, by the way, characterizing this valley in a hundred sequestered nooks. Near Bach Tumulus, which may be connected with that at Newton, is a spot called "Scotland Bank," to which the tradition clings that it got its name from a Scot having been hunted to death by dogs here in the Civil War; but, as the Welsh name for thistles would in sound assimilate to the name Scotland, there is probably no real basis for the tradition, except the general fact that the Scots pillaged and overran the country during the troubles at this period. On the roadside, a little before reaching Dorston, is a maenhir, now doing duty as a gate-post; whether it has or has not any inscription upon it cannot be affirmed, because what seem like indentations are covered by moss, and are otherwise difficult to make out; but it was clearly recognized of old as a stone of no common order, seeing that a tradition lingers that it was thrown at a cast by King Arthur from Arthur's Stone to its present resting-place, and that later legends about it illustrate the practical wit of our ancestors in this out-of-the-world valley. We learn that one of their means of inducing the rising generation to get up early was to propagate the story that this stone was in the habit of going daily to the Wye for water at daybreak, and so incite them to rise *dilatado* in order to be able to attest it. The story is something like that of a freshman at Cambridge being taken to Magdalen Bridge to see "term divide"; as that about King Arthur's fling is like "Robin Hood's butts."

And now we find ourselves at Dorston, the entrance to which is by a ford of the Dore, which rises here, and beside which is a foot-bridge of flat stones with a rail, such as is more than once to be seen in this district, for foot passengers. The derivation of Dorston is pretty certainly *Dwr*, "water," and *ton*, "an inclosure"; and it is now generally accepted belief that the Golden Valley is a misnomer, due to the fanciful brain of some monk who, ignoring the identity of *Dwr* with Dore, chose to translate Nant *Dwr* into "Vallis Deaurata." The village is pretty, and the church has a picturesque tower, which makes a feature in the landscape. There is little else in it deserving notice excepting a double piscina of very beautiful work on the north side of the chancel, and in another place the base of a mural tablet of the same work. Besides these there is a modern stone pulpit. In this parish, however, towards the west of the church, are the site and scanty vestiges of Dorston Castle, which, but for the presence of stones at its sharply aloped sides in more or less ordered position, might seem to be only a camp or mound of the same type as that at Stocking, a half-mile or so further to the right. Other tumuli in the parish are Mynydd Brith and Nant-y-bar; but Dorston lays some claim to a history, though it is singular how completely effaced are the towers which must have crowned its eminence in the thirteenth and fourteenth centuries, when it was held by the De Solers family under the Mortimers. Mr. Robinson, in his *Castles of Herefordshire*, thinks it may have been levelled by Glendower; and if, as in the case of Charles I., there were any foundation for the theory of his passing a night in the Golden Valley, it is pretty obvious that for Dorston Castle we ought to read Snodhill, always unmistakably a fortress of more consequence, and not, like Dorston, a mere outpost or subsidiary fortress. Returning to the village and proceeding towards Peterchurch, at a

farmhouse near the brook, called the Crossways, there is a tradition that the trained-bands used to keep guard, and it was from the site of a field a little further on the left of the road to Peterchurch that the battery was directed against the castle of Snodhill. This lies to the south of Dorston and west of the Peterchurch road, on a steep and strong eminence, in a stage of dilapidation somewhat less pronounced than that of Olifford Castle. It is probably of semi-Norman construction, and has yet remaining a gateway with an Edwardian arch and portcullis groove, with some fragments of the walls of the outer bailey. It was in Henry III.'s reign a manor of the De Chandos family, and so continued till 1428, about which time the De la Meres seem to have had a moiety of the castle and manor of Snodhill as well as Dorston. It passed later on through Anne Neville, heiress of the Beauchamps, to Henry VII. and his heirs, and Queen Elizabeth granted it to Dudley, Earl of Leicester, from whom it passed, by purchase, from the Vaughans to William Prosser of London, who built Snodhill Court, an ancient extant manor-house, of the castle materials. His initials, with the date 1667, are carved on the front of Snodhill Court, still in the possession of the representatives of the Prosser family.

Snodhill is in the parish of Peterchurch, the capital of the Golden Valley, situate on the Dore, and having an area of 5,000 acres. To this the high road brings us in due course, the tall and graceful, though now dilapidated, spire indicating its whereabouts at some distance in all directions. The town or village is quiet enough; but its fine Norman church, with two chancels and a terminating apse and peculiar lancet windows, its ample and spacious nave, and the splendid yew-trees in the churchyard, avouch no less its ancient importance than its venerable antiquity. In the wall on the right of the outer chancel is a passage said to have led to a gallery, which some inhabitants profess to recollect; it might otherwise seem to have led to a stone pulpit, or possibly to a roodloft. In the apse is a very early stone altar, and above one of the doorways a rudely sculptured stone, representing a fish with a gold chain round its neck, traditionally said to be the eponymous fish of the river. One would like to know more about this sculptured fish, as also of the "Dragons' Pool," which gives the name to a farm in the parish, though we could not learn why or wherefore. The fish may have been associated with that which the Apostle was bidden to catch for the purposes of tribute money. Hard by the church is St. Peter's Well, the waters of which are still credited with healing powers, especially in cases of weak eyes. Somewhat to the west, upon the high ground, is Urishay Common, on which, as at Dorston and Fowmynd feasts, in the same out-of-the-way districts, old folks still remember the rude pastime of "pelting with crabs" to have been customary in their youth. Urishay Grange, a building of Elizabethan date, is a picturesque manor-house of past consequence, for many generations the home of the Delahays, one of whom in 1423 represented the county. The road and the river pass through the parishes, near together, of Turnaston and Vowchurch, before reaching the last of which at Poston there is an ancient camp or entrenchment, as there is also another in Turnaston parish. In the chancel of Turnaston church, which has a wooden turret, are alabaster figures of Thomas Appary and his wife Agnes, date 1522; and within the precincts of the old park of Poston, in Vowchurch, is seen, on an eminence, the round-house or casino built for Sir Edward Boughton, which is still used as a shooting box. The course of the Dore is followed onward for a mile or two to Barton, a small parish with a Norman church and square tower, notable for an epitaph to Blanche Parry, "a maid in Court, & never no man's wyfe," sworn of Queen Elizabeth's bedchamber, and a member of a chief branch of a family settled there since 1400 A.D. Through a co-heiress the property came by marriage in 1610 to Rowland Vaughan of Bredwardine, an author and agriculturist far in advance of his age. To him we owe the description of the Golden Valley, in the times preceding the Civil War, as having very many poor settlers in it—in short, that it was "the plentifullest place for poore in the kingdom." A mile and a half further is Abbey Dore, a picturesquely situated church or abbey and parish which may fairly claim to be the glory of the district. The valley here has considerably narrowed, and the tower of the restoration added by John, Viscount Scudamore, in 1634, who re-roofed the transept, rises from amidst the venerable pile and its surrounding buildings in a manner worthy of its Cistercian original. Among the special features of the present building are the restored transepts and choir of the old abbey, the chancel screen of Lord Scudamore's date, the putative altar-slab of the ancient church, with the many peculiarities of the arches and clerestories, and the varieties of tracery in the windows. Within the parish was the old mansion of Moorhampton, where tradition says that a dozen centenarian morris-dancers performed before King James I.; and Kingston Grange is a still standing example of the old-fashioned timber house of the early part of the seventeenth century. From Abbey Dore the river makes a bend to the south-east, and, leaving Ewyas Harold, which is on the Dulas brook, to the west, hastens to its confluence with the Worme, near the restored church of Kenderchurch, above the Hereford, Abergavenny, and Newport Railway, a mile north-west of Pontillas, and two miles to the south-east of Abbey Dore.

The Golden Valley district is described by Mr. Symonds, F.G.S., as a district of "old red" strata of hills of corntones, sandstones, and denuded valleys; and if we refer to Drayton for his poetical description of the river and its banks, and the climate of "the goodly

golden vale," we shall find that, with due allowance for a poet's license, there is much truth in his picture of this handmaid of the Wye:—

Banks crowned with curled groves from cold to keep the plain,
Fields battal, flowery meads, in state them to maintain.

The exploration of this district should not be deferred until the completion of the railway. The advent of civilization is apt to sweep away in its path many ancient vestiges; and though it is to be hoped that the promoters of the Golden Valley line value their local antiquities, it will nevertheless be prudent for the curious to take time by the forelock.

FRENCH ART IN THE SALON.

THE critic who passes from the Royal Academy to the Salon will be struck at once by two important elements of distinction belonging to the exhibition of Paris. He will find at the outset that, considered merely as a representative display of the year's work, the Salon is far more comprehensive and complete. It really is what it pretends to be—a national exhibition of art wherein is contained all, or nearly all, that the contemporary artists of France desire to show. How wide is the range of taste covered by the contents of the galleries of the Champs Elysées may be judged as well from the astonishing number of works exhibited as from the character of the little that is left to be represented elsewhere. With 4,616 examples of various sorts inscribed in the catalogue, it is hard to believe that much can have been omitted that was deserving a place; and this faith in the fulness of the display is only strengthened by a visit to such an exhibition as that of the Impressionistes, where we are allowed to inspect the latest manifestations of the newest and most extravagant artistic creed. In the case of modern English art the conditions are widely different. The Royal Academy is only one of a group of artistic societies, each of which supplies a distinct feature in the general display, and the student of art has to lay out quite a little fortune in shilling admissions before he can see what his more fortunate brothers in Paris can see at the cost of a single franc. But even when the scattered material has thus been collected from various sources, the impression of the whole is still in striking contrast with that to be gained from a review of the contents of the Salon. Of the various branches of art practised in England, there is only one that can be said to possess real vitality; and when we speak of a representative collection of the works of English artists we mean, in fact, an exhibition of painting, and nothing more. Sculpture only just survives among us, and engraving in the latest phases of its development is recognized only within a limited circle, and chiefly by amateurs. The modern art of France, however great may be its defects, enjoys at least a more liberal scope. It is alive in all its branches, and is perhaps strongest in those very departments of sculpture and engraving where our practice is so insignificant.

For several years past the sculpture of the Salon has taken the leading place in the exhibition, and on the present occasion, in spite of the absence or imperfect representation of several eminent sculptors, the same relation between the two branches is still maintained. The causes of this superiority are indeed not difficult to discover. It is not merely that the practice of sculpture has advanced in France, but that French painters, losing the guidance of the men who were their leaders a few years ago, are now passing through various phases of experiment without any fixed aim or settled methods of work. That movement towards a stricter realism of representation by which both arts have been affected is in the department of painting not yet complete, and many of the younger school of painters are still almost entirely absorbed by problems that concern rather the means than the ends of art. The study of landscape which gave to France a great group of painters, headed by men like Corot, Rousseau, Diaz, and Millet, has resulted in a new appreciation of the laws of aerial effect as applied to other kinds of painting as well as landscape. The truths of atmosphere, the modifying influences of changing effects of light and air upon the definition of form and colour, are now the prime objects of study to the younger generation of artists. They can perceive for the moment scarcely any ideal but this, and they are disposed to regard every style of art which does not include a representation of this particular aspect of nature as a merely artificial product to be discarded by the modern spirit. It will readily be understood that such a view of the requirements of art is not favourable to the production of very serious work. The painter, intent upon imitation of a single truth, is comparatively careless of his theme; he is careless also of those finer truths of form and character which underlie the variations of tone. His general conception of the purpose and function of art is infected with the principles of his executive style, and from constant imitation of particular truths of atmosphere he comes at last to believe that a painter is only entitled to study the aspect of life constantly presented to him, that he is bound to paint modern costume, modern streets, and modern rooms. We do not mean to say that these principles, which find their most brilliant expression in the works of men like Duez and De Nittis, are the principles of the entire French school; but at the same time no one can fail to perceive that the style of execution which they have induced now exercises a disturbing influence upon painting of all kinds. Such a style is well fitted to

express the modern feeling for landscape; nor is it inconsistent with the requirements of portraiture; and accordingly we find that portrait and landscape are among the most successful products of the French school. Apart from the excellence of the works in the former class by men like Dubois, Bonnat, and Meissonier, whose individuality is scarcely affected by the movement we have been discussing, there are in the present exhibition some admirable portraits in which the prevalent ideas of art are distinctly expressed. Of such kind, for example, are the works of Ribot, Bastien-Lepage, Fantin, and De Neuville. In the painting of landscape the study of aerial effects has a natural place, and there are several examples in the exhibition which have in this respect all the force and freshness of a sketch. Even here, however, may be observed a dangerous tendency to subordinate the permanent truths of the scene too completely to the momentary truths of light and air. Many of the landscapes in the Salon are indeed gigantic sketches, and nothing more. They record with success the right relation established between the different masses of colour; but they scarcely attempt the more difficult task of elaborating the details of the subject without disturbing this relation. Among the most delightful examples of French landscape exhibited this year are two canvases by Guillemet, whose execution is comparatively elaborate and complete. The one represents the shores of Dieppe at low tide, the other an inland scene near Armentau, and both are alike remarkable for the successful impression of life and movement in the treatment of the sky. But it is when we pass from portrait and landscape to the consideration of the higher class of subject pictures that the injurious effect of the modern principles of execution are made most clearly manifest. In works professing an ideal aim there is scarcely anything to choose between merely academic painting as represented by men like Bouguereau and Cabanel and those vast and vacant canvases of younger men where an unreal, and even impossible, design is combined with the most realistic system of execution. The large picture of the death of Marceau, by Laurens, to which the jury have justly awarded the highest honours, has no charm of colour. It is admirable in the grave force of its sentiment, and very powerful in the rendering of facial expression; but the spirit of the work is superior to its design, and the design again infinitely superior to the painting. Moreover it is to be observed that M. Laurens has not attempted to create a work of the highest qualities of style. His main object has been to represent with force and fidelity a touching historical incident, and he has therefore ordered his composition rather according to the laws of a painting of genre than by any standard of abstract beauty. The same remark applies with increased force to the large picture by Gervex. Here, however, the theme is comparatively insignificant, and certainly did not require so large a space for its display; the great merit of the work lies in its brilliant colour, in its effective combination of the tones of white and gold, and in the skilful management of light.

It is perhaps by reason of this unsettled state of the art of painting that the most serious aspirations of the modern French school find expression in sculpture. The sculptor is freed from the many temptations and difficulties that are inseparable from the employment of colour. He is not so likely therefore in the pursuit of new truths to lose sight of the importance of the old; he can never without obvious sacrifice neglect those qualities of style which give dignity to the rendering of human form. It is true that, under the influence of a genius like Carpeaux, French sculptors were driven with new impulse to the study of reality; but this tendency, if we except a few instances of individual extravagance, has had the effect of purifying and enriching the resources of the artist. A fresh observation of the ways of nature has led to a quickened appreciation of the laws of art, and the last few years have served to prove that French sculpture, in common with the most remarkable forms of English painting, is now seeking for new inspiration from the study of the work of the Renaissance. It would be impossible to find a higher example of the results of this movement than is afforded by the statue by Paul Dubois, now to be seen in the Grosvenor Gallery. This was the artist's contribution to the Salon of last year. It forms one of a series of four allegorical figures, designed for a monument to be erected at Nantes, of which only two have yet been exhibited. The others, we presume, M. Dubois is reserving for the International Exhibition of next year. On the present occasion he sends only two portrait busts. Allar, whose group of Eve and Satan was another prominent attraction in last year's show, also confines himself to portrait, while Chapu, although his works are sufficiently important in scale, scarcely satisfies the severe standard of beauty which he made for himself by his exquisite figure of "La Jeunesse" exhibited two years ago. The full-length portrait of Berryer has but little dignity in its studied elaboration of design. The gesture is oratorical, but it is not sculptural, and the flowing draperies do not yield in their outline an impression of entire simplicity. The figure of "La Pensée" upon the monument to Daniel Stern suffers in like manner from an injudicious choice of gesture, but here the execution is full of refinement and force. Then, again, Delaplanche, whose "Vierge" of last year and "L'Education Maternelle" of two years ago are not to be forgotten, falls far below himself in a fantastic figure entitled "Music;" while Falguière, who maintains a reputation in both painting and sculpture, sends as an example of the latter only the bronze reproduction of the portrait of Lamartine exhibited last year. And yet, in spite of these disappointments from artists of established fame, the collection of sculpture is eminently

interesting and attractive. It contains no "sensational" feature, like the group by Sarah Bernhardt of last year, unless the first essay in sculpture by Gustave Doré is to be regarded as a sensation. "La Parque et l'Amour" is certainly much superior to M. Doré's paintings. It is marked by greater sobriety of invention, and a more studious attention to the laws of design; it cannot, however, be accepted as a complete or satisfying performance, seeing that both figures lack distinction of type and character, and that the group only composes from one point of view. Prominent among the excellent contributions of younger and less popular artists are the works of Icard, Granet, Lemaire, and Lefèvre. The presence of any one of these artists would suffice to give distinction to our own exhibition, and in the Salon they stand by no means alone.

THE OPERAS.

SIGNOR GAYARRÈS appearance as Faust has confirmed us in the opinion we have already expressed as to his vocal and dramatic qualities. His singing in this part was marked by all the tricks and faults which have been already described, and was further rendered disagreeable by a nasal intonation which we had not previously observed. His acting was not devoid of good intentions, but was so completely wanting in dignity and grace that it became difficult to believe in the influence exercised by Faust over Gretchen. Signor Ordinas, a new singer, appeared on the same occasion as Mephistopheles. This part M. Faure has so much identified with himself that unusual difficulties are thrown in the way of any one else who attempts it. We have often commented upon the mistakes made by singers who have either presented a feeble imitation of M. Faure or attempted originality in mistaken directions. It is pleasant to note that Signor Ordinas cannot justly be accused of either of these faults. His conception of the part corresponds generally with that of M. Faure, which indeed is to our thinking the only one that can be right; but his execution was good without suggesting any direct imitation. Signor Ordinas has neither the fine presence nor the perfect art of M. Faure; but he nevertheless succeeded in making Mephistopheles a very sufficiently diabolical personage; he has a fine voice, which happily is not disfigured by tremulousness, and he used it, on the whole, to good purpose. His singing of the "Dio dell'Or" in the Kermesse scene was coarse, if vigorous; but he made up for this by the merit of his execution of the serenade in the fourth act, in which he delivered the laugh in a manner original and striking. Signor Ordinas's acting in the scene where Mephistopheles shrinks in terror from the sign of the cross aimed at originality, in the effort after which he was betrayed into an exaggeration which we may hope he will correct on future occasions. The notion of making Mephistopheles fall prostrate is not a happy one; and the singer will do well to omit this action. Another new singer, Mlle. Synerberg, appeared as Siebel, without any marked success. Mlle. Albani's Margherita we have on previous occasions spoken of with much praise; and it has certainly improved rather than lost since last year. Signor Cotogni as usual sang and acted finely as Valentine. Signor Vianesi, also as usual, took many of the times wrong, especially those of the old men's chorus and the introduction in the overture of Valentine's cavatina. The chorus behind the scenes in the first act was hopelessly and painfully out. The stage management of the opera is, with one exception, excellent. This exception is found in an ingenious device prepared at the end of the first act. When Faust has thrown off his long gown and beard, the scene at the back changes, and discovers what third-rate novelists call "a gilded saloon." The childishness and tawdriness of the effect need scarcely be seen to be believed.

The performance of the same opera at Mr. Mapleson's house has been far superior to that at Covent Garden. Signor Fancelli's acting of Faust is perhaps not very much better than Signor Gayarrès's; but his singing, though it no doubt wants something in delicacy, is excellent in intention and method. M. Faure's wonderful performance of Mephistopheles, which last year seemed as near to perfection as possible, has yet gained by the addition of such touches as the mocking defiant gesture which the singer has introduced at the point when Mephistopheles draws a circle round himself to ward off the attack of Valentine and the students. The effect produced by M. Faure's whole performance, and especially by the serenade and delivery of the devilish laugh which ends each verse, can be best illustrated by reference to a fantastic story of Théophile Gautier's, called "Deux Acteurs pour un Rôle." This tale, written at a time when its author was impressed with the weird stories of Hoffmann, relates how a young actor, famous for his playing of Mephistopheles, meets with a strange-looking man who picks holes in his performance, and says to him:—"Je n'ai pas été satisfait de votre rire; c'était un rire d'espiègle tout au plus. Voici comme il faudrait rire, mon cher petit monsieur Heinrich." Et là-dessus, comme pour lui donner l'exemple, il lâcha un éclat de rire si aigu, si strident, si sardonique, que l'orchestre et les valse s'arrêtèrent à l'instant même; les vitres du gaesthof tremblèrent." The next night as Heinrich is going on the stage he meets the stranger, who is dressed in a costume exactly like his own, and insists on taking the actor's place, observing that he cannot allow himself to be any longer misrepresented. He goes on the stage, and "ce jeu incisif, mordant, venimeux et vraiment diabolique, surprit d'abord les auditeurs. Ce qui produisait surtout

un grand effet, c'était ce richement aigre comme le grincement d'une scie, ce rire de damné blasphémant les joies du paradis. Jamais acteur n'était arrivé à une telle puissance de sarcasme, à une telle profondeur de scélératesse; on rit et on tremblait." It would be difficult to give a better account than this of certain portions of the performance of M. Faure, who does indeed seem in this part to have sounded every depth of diabolical malice and mockery, and who in the cathedral scene appears as majestically pitiless as in other scenes he is fiendishly gay and careless. Mme. Nilsson seems to us to realize Goethe's Gretchen as completely as M. Faure does his Mephistopheles. It has been objected to Mme. Nilsson's performance that she makes Gretchen too impassioned; but the objection does not seem well founded. In the first scenes there is no suggestion of passion; and, if there were none afterwards, one would have to believe that the fall of Gretchen was brought about entirely by diabolical agency, and was in no way due to human weakness. To us the gradual progress of Mme. Nilsson's Gretchen from dreamy contemplation to the self-abandonment of love appears completely admirable in conception and execution. The exquisite delicacy of Mme. Nilsson's singing, especially in the jewel song, has lost nothing of its accustomed beauty. Signor Del Puente's singing of Valentine was not altogether satisfactory; his delivery of the cavatina in the Kermesse scene was rough, and marred by the introduction of tones which would have belonged more fitly to Mephistopheles. Mlle. Justine Macvitz's rendering of Siebel was in no way happy. The orchestra and chorus were far better than at the other house, and, indeed, left little to be desired except in the unseen chorus in the first scene. The playing of the organ in the cathedral scene was especially fine. The arrangement of this scene would be improved if the niche in which Mephistopheles appears were placed in fuller view of the audience.

Two new singers have lately appeared at Her Majesty's Theatre, Mlle. Emilia Chiomi and Signor Talbo. Mlle. Chiomi has appeared as Lucia di Lammermoor. On the occasion of her first appearance she seemed to suffer from a natural nervousness, and was, we believe, further overweighed by indisposition; but, in spite of these disadvantages, obtained a well-deserved success. In the second act especially, at the point when the marriage contract is signed, Mlle. Chiomi's performance was both vocally and dramatically full of merit; and it is evident that much may be hoped from her. Mlle. Chiomi, who possesses a voice of much freshness and power, has, we believe, gained considerable reputation on the Continent by her performance of Mignon; and we must hope to see her appear, if not in that opera, at least in something less well worn than *Lucia di Lammermoor*. Signor Rota sang well as Enrico Aston, but wore throughout an air of weak benevolence not very consistent with the character. Signor Talbo's first appearance was in the part of the Duke in *Rigoletto*. His voice, especially in the middle register, is far from pleasing in quality, and his intonation was by no means certain in many passages. His acting is of the most primitive kind. He has, however, the merit of singing without tremulousness; and possibly some of his defects should be set down to nervousness. He gained much applause by his execution of "La Donna è mobile," which he sang leaning in an ungainly fashion on a chair, and in which, when encoired, he introduced a chest C. The delivery of this note invariably assures applause to the singer who utters it, and who is supposed to have done something very clever in giving it forth. Signor Galassi's *Rigoletto* is a fine performance both in its singing and acting, and Mme. Treballi's Maddalena is, like everything this singer undertakes, admirable. Mlle. Valleria is not very successful as Gilda. What Signor Broccolini might have made of Sparafucile if he had known the notes of the part somewhat better it is impossible to say.

The return of Mme. Patti to Covent Garden is always an event of importance; but thus far at least she has appeared only in operas in which her performance has been frequently described or criticized. It is part of Mme. Patti's system that her singing never alters; her execution is always brilliant and faultless, and always makes one long for the expression of more emotion even at the cost of some blot in the dexterous performance. M. Maurel, whose successful appearance with Mme. Patti in *L'Etoile du Nord* we noted last year, has been suffering from indisposition, from which we must hope he will recover before he has to appear in the forthcoming production of *Il Vascello Fantasma*, as Herr Wagner's *Flying Dutchman* is called. M. Capoul has appeared as Raoul in the *Huguenots* with considerable success. Some doubts entertained as to his voice being powerful enough proved to be needless. M. Capoul's singing of the part had just the same faults and merits that are observed in the singer's Faust. His acting was throughout good in intention; but was sometimes spoilt by extravagance of gesticulation. At one point M. Capoul was thoroughly admirable. This was in the sudden change of expression and gesture at the sound of the bell in the great duet, which could hardly have been given more impressively than it was by M. Capoul.

THE OAKS.

IT seems to be commonly believed—if we may revert for one moment to the Derby—that if he had had a fair share of luck, Rob Roy would have beaten Silvio in the great three-year-old encounter at Epsom. Undoubtedly Rob Roy was running stronger.

than either Silvio or Glen Arthur at the finish; undoubtedly, also, Tattenham Corner has more than one Derby defeat to answer for; yet a first-class horse in moderate company ought to be able to win without having everything his own way in the race. Pero Gomez was as nearly as possible knocked down at Tattenham Corner, yet he managed to make up the lost ground and run Pretender to a head. Indeed many people thought that the head was the other way; and Pretender, if not up to the highest form, was probably quite as good a horse as Silvio or Glen Arthur. Judged by his actual position in the race—a head in advance of Rhideroch—Rob Roy would not deserve to stand very high in the handicapper's estimation; but, granted that that form is wrong, we are still of opinion that if he had been as good as was supposed, Rob Roy ought to have done more than he did in the last quarter of a mile when once he had got clear of the gigantic Thunderstone. With Chamant practically out of the way, he might even have ventured to adopt the tactics pursued—perhaps unintentionally pursued—with Placida in the Oaks, and have taken the lead at the commencement of the race, and kept it. Such a policy is bold no doubt; but a horse who is good enough to try it secures himself at any rate from disappointments on the most disappointing of courses.

The followers of public form, if terribly worried in the Derby, had their revenge in the Oaks, which was run in more than usually unfavourable weather. The nine runners included Belphebe, the winner of the One Thousand Guineas, Lady Golightly, Placida, La Jonchère, the winner of the French Oaks, Plaisante, and Muscatel. The last-named had never appeared in public before, but came with a great private reputation from the North. She is a remarkably fine-looking mare, and attracted perhaps more admiration in the paddock than any of the other competitors; and, as will be seen, she took a very creditable part in the race. It was evident that Lady Golightly had made no improvement since the One Thousand; but, on the other hand, Belphebe, who beat her at Newmarket, had done well, and was in excellent condition. La Jonchère had a strong body of admirers, who relied on the good form she had shown in France, and were well content with her racing-like appearance; and Placida, if not altogether taking to the eye, was full of power and in perfect health. Altogether, the four Oaks mares, Placida, Belphebe, Muscatel, and La Jonchère, would hold their own, in looks at any rate, against any four of the Derby horses, and would possibly hold their own in a race also. According to public running, Placida occupied, and was justly entitled to occupy, the position of first favourite. She won seven races out of nine last year; and her victory at Lewes over Chevron, Shillelagh, Palm Flower, Dee, and Chamant was one of the best two-year-old performances of the season. Belphebe's head defeat of Lady Ronald in the One Thousand Guineas would not stand comparison with this achievement; and Lady Golightly has already given proof this spring of having lost her fine two-year-old form. Muscatel had only private reputation and good looks in her favour; and the French three-year-old fillies defeated by La Jonchère are believed to be only moderate. Thus, with Palm Flower removed from the competition through the death of her nominator, the way was made comparatively easy for Placida; and the race, though somewhat hazily run, was secured by her in the end with consummate ease. After one break away, the flag fell, and the favourite at once rushed to the front, and her jockey seemed wholly unable to hold her back. Astrée, who was started in order to make the running for her stable-companion La Jonchère, never succeeded in fulfilling her mission; and as it became more and more evident that the leader showed no signs of coming back to her field, the field bestirred themselves as best they could to get as near to her as possible. But every attempt was fruitless, and though her jockey so far got her under control as to prevent her from breaking away, yet he could not prevent her from maintaining her position in front. In fact, Placida went the entire course pulling double; and though Muscatel and Belphebe made a gallant challenge for victory, they could never reach the daughter of Lord Lyon, who won without having been once called upon by three-quarters of a length—a distance which, as it appeared to us, might have been indefinitely increased at her rider's pleasure. Belphebe sustained her One Thousand reputation by beating the remainder of the field, and Muscatel finished a good third. The victory of Placida was a triumph of public form, and also a triumph to Lord Lyon, whose stock have been deemed incapable of staying. The race was also a contradiction of another maxim, which generally holds true, that horses which overpower their riders in the beginning of a race will fail to stay to the end of it. There is no doubt that Placida is a mare of very high class, superior to many Oaks winners of recent years; and we think that, in estimating her at 4 lbs. below Rob Roy and on an equality with Altyre, the framer of the Free Handicap Sweepstakes, to be run at the Newmarket Houghton Meeting, has very much underrated her merits. Both Rob Roy and Altyre will have to make a great improvement on their Derby form to stand a chance with the flying daughter of Lord Lyon and Pietas.

The general racing of the Epsom week was remarkable for the excellent form shown by the old horses. Dalham opened the ball by beating Controversy by three lengths for the Craven Stakes, the three-year-olds never having the slightest chance with the two six-year-olds. Then Trappist beat a good field, including Brigg Boy, Pluton, and Beumber, for the Egmont Plate; and Captain Prince's five-year-old may now be esteemed one of the best weight-carriers

of the day over his own distance. On the third day of the meeting Petrarch displayed his brilliant speed over the mile-and-a-half course he failed to compass a year ago, and won the High Level Handicap from Rabagas II., Lillian, and Queen of Cyprus. Hesper, again, carrying 9st. 5lbs., was only beaten a neck by Sweet Note in the Welter Handicap; but Lord Lonsdale's four-year-old had his revenge for this defeat on the following afternoon, when, with the weights much more in his favour, he secured the Epsom Cup after a desperate finish with Dalham. The pair were opposed by The Ghost, Pluton, Warrior, Mate, and three more, and The Ghost for once made a creditable show, not being finally disposed of till opposite the Stand. Then the finish was left to Hesper and Dalham; and the Duke of Westminster's horse, never being quite able to get up, suffered a head defeat. The fine form shown during the week by Dalham furnishes additional proof of the excellence of Umpire, who beat him at Manchester, and who is probably one of the best horses of the day. Collaterally, also, the form of Rosebery is enhanced, and the appearance of the hero of the Cesarewitch and Cambridgeshire of 1876 in Cup races is anxiously expected. The chief two-year-old event of the week, the Woodcote Stakes, fell to Cyprus, the representative of the formidable Russley stable, but it is probable that Centenary, who ran second, may turn out to be the better of the two at some future time. For the rest, the early two-year-old form was, as often happens, turned topsy-turvy. Ersilia, Grace, and La Merveille had to lower their colours; but, in excuse for Grace, it may be said that Lady Lumley, who beat her in the Stanley Stakes, got away with a flying start, which, in a half-mile scurry, is everything. On the whole, the general racing of the week was of more than usual interest, and quite made up for any disappointment felt at the collapse of so many Derby candidates, and the consequently diminished lustre of the great attraction of the meeting.

The first of the great yearling sales of the season took place last Saturday, and it does not appear that breeders will have to complain of scarcity of purchasers or badness of prices. Forty-five lots were disposed of at Middle Park for an average of 273 guineas, which cannot be unsatisfactory to Mr. Blenkiron. The Rosicrucians quite carried off the honours of the day, a son of Sir Joseph Hawley's beautiful horse and Bas Bleu—half brother accordingly to Blue Gown—fetching 1,500 guineas, a son of Hilda realizing 1,050 guineas, and daughters of Pandora and Anderida 900 and 600 guineas respectively. The young Vespasians also sold well, the highest price obtained being 650 guineas for a son of Vespasian and Entremet. The stock of Victorious also commanded considerable attention; and, on the whole, the result of the sale was none the less satisfactory because there were no sensational prices, such as are made later in the season when large winners at Epsom and Ascot bid more out of a spirit of reckless bravado perhaps than because the article is really worth the money they offer. It is said, on good authority we believe, that any advance on 150 guineas for a yearling is clear profit to the breeder. If that be so, the figures obtained at the Middle Park sale show that Mr. Blenkiron has received no inadequate recompense for the trouble and anxiety inseparable from the management of a large breeding establishment.

REVIEWS.

LEWES'S PHYSICAL BASIS OF MIND.*

THE present volume, the third of Mr. Lewes's *Problems of Life and Mind*, will probably be found to be even more interesting than the two which have already appeared. It has less of abstract and logical discussion, and includes in its wide range of contents some of the most interesting and keenly contested questions of biological science. We have on former occasions pointed out the singular merit of Mr. Lewes's handling as a popular expounder of the latest results of scientific research. As he goes on with his task he seems to gain in ease and naturalness. In the present volume we seem hardly to be reading a book so much as listening to the conversational lecture of a teacher who is taking us completely along with him from step to step, and answering, as they arise, the difficulties which present themselves, but which he formulates for us much better than we could for ourselves. If the exposition errs perhaps a little on the side of diffuseness and repetition, it secures thereby that quality of readableness without which the most consummate knowledge and the most transcendent powers of style are useless. This quality of readableness is one which Germany knows not. Those whose profession compels them to much reading of German books have to groan over much waste of time and much trial of temper, because no German is acquainted with the commonest rules of rhetoric, or has any notion of how to convey a meaning to another intelligence. Mr. Lewes's style is a model of exposition, being not only intelligible, but so easy that, if it does not supersede the necessity of attention, it at least removes from it all the pain.

In his first volume of "*Problems*" Mr. Lewes was found occupying his old position of antagonism to metaphysics, but with a

* *The Physical Basis of Mind; with Illustrations. Being the Second Series of "Problems of Life and Mind." By George Henry Lewes.* London: Trübner & Co. 1877.

saving clause. Thirty years before, when first coming forward as a writer on such subjects, Mr. Lewes stood pretty nearly on the Comtist platform, denouncing all philosophy—and this in a History of Philosophy—as an illusory pursuit of shadows in the realms of the unknowable. In the first volume of "Problems" we found him reducing this sweeping condemnation of all speculation within narrower dimensions. The assiduous devotion of a life of study to the subject had not only deepened his knowledge, but chastened his intellectual aspirations. Like all other searchers after truth who had been dazzled in youth by the brilliant but superficial generalizations of Auguste Comte, he had recovered his power of sight, and "felt confident of having something like a clear vision of the fundamental inductions necessary to the constitution of psychology." "Metaphysics," which had been proscribed in the lump, were now divided into two portions—the "metempirical" portion, which was pronounced to be hopelessly impossible, and was to remain excluded from the intellectual sphere; and a residuum of metaphysics which was to be transformed by reduction to the method of science. It was now declared to have been an error in Comte that he peremptorily excluded all research into metaphysical questions. The questions exist, and will continue to be asked; ignoring them will not set them at rest. Comte's plan of "ordering" that they shall not be asked is despotism, not scientific. Mr. Lewes's old hostility to metaphysics was not abated. On the contrary, he recurs again and again to that theme. Metaphysics was "to be stamped out of existence. It is an obstacle in our path; it must be crushed into dust and our chariot-wheels must pass over it"; saving, however, a certain portion, which was "to be converted into motive powers, and what is an obstacle become an impulse." The name "metaphysics" was to be retained, because it has had godfathers so illustrious that it ought to be preserved. But it was to be retained with an entirely new meaning, to designate that division of physics which deals with "the highest generalizations of research."

On this preliminary enunciation of Mr. Lewes's general scheme in his first volume there arose among his readers much doubt as to what was his new position towards metaphysics. Some critics thought that he really stood upon the old ground of total disregard to speculative questions. They thought they saw in his apparent concessions a mere disguise of the old antagonism—a courtesy of warfare, and nothing more. One reviewer, in particular, who argued the case at great length, showed, as he thought satisfactorily, that Mr. Lewes had indeed professed to be able to give a scientific solution of metaphysical problems, but that he had first taken care to eliminate them all under his new term "metempirical." While some of his readers thus understood Mr. Lewes to be holding fast his original negation of "philosophy," there were others who took exactly the opposite view, and triumphed over having in him an illustrious convert from Positivism. They regarded the "Problems" as retracting the extreme anti-metaphysical dogmatism of the "History." They regarded Mr. Lewes's extension of the scientific method to the problems which used to be called "philosophical" as a *bona fide* enlargement of the domain of science, which was now, for the first time, made coextensive with knowledge.

The present, or third, volume of the "Problems" will no doubt be taken as confirming this last interpretation of its author's views. The interesting chapter headed "Animal Automatism" goes much further than we had yet been prepared for, in its inclusion of metaphysical inquiries within the legitimate field of knowledge. In his first volume Mr. Lewes was still found insisting upon the exclusive rights of science to possess, and legislate for, the whole domain of knowledge. All theological and ontological conceptions, everything which was not phenomenal, were banished into the region of the unknowable as metempirical. Only such philosophical questions were to be asked as could be answered in the terms, and on the conditions, of empirical science. But in the present volume, and in the chapter on "Animal Automatism," we find to our surprise a large and important section of purely metaphysical speculation brought back to our notice, not included in the method of scientific investigation, but established on its own basis in parity of rights with science. Mr. Lewes describes the development of the special sciences out of the first notion by the process of self-limitation. Each science abstracted from the complex of phenomena one single class of facts which alone it agreed to regard. Science in its progress should go on thus ramifying till all phenomena, the whole domain of the knowable, were classified and accounted for. Such would have been, in old time, Mr. Lewes's position. But now we find that, concurrently with this growth of science, a critical process was going on, which, analysing the nature of perception, was rapidly moving towards another goal. Locke, Berkeley, Hume, and Kant, directing their analysis exclusively to the subjective aspect of phenomena, soon broke down the barriers between the physical and the mental, and gradually merged the former in the latter. That is to say, the whole of the idealist psychology of the eighteenth century, including its ontological doctrine of the non-existence of phenomena, is placed side by side with science as an equally legitimate application of the human understanding, and as constituting a moiety of the domain of knowledge. Science knows nothing but phenomena; phenomena have no existence—nothing exists but my subjective "feeling." Of these two incompatible hypotheses either may be made the starting-point for our intellectual progress. The former hypothesis leads, and has led, to those magnificent acquisitions which in the last two centuries have changed the face of the globe and the course of human history by

giving man a degree of mastery over his environment undreamt of before. The latter hypothesis, that of idealism, has issued in nothing but the unsubstantial dreams of a few idle philosophers in the German schools. It is bewildering indeed to find that the two hypotheses are not only reconcilable, but are equally true and equally valuable. The inductive method of science is now no longer the only legitimate method; consciousness and the method of introspection is to rank *pari passu* with the scientific method. We seem to have lost sight of the landmark of the first volume, in which we were told that "where the speculative quits the ground of sense and verification the region of the metempirical begins, a region where we have not even probability as a guide, a morass of uncertainty, where all footing yields and all tests fail." Surely when the data of consciousness are elevated into a source of information equally valid with phenomena presented to the sense, we have got into that "world of abstraction which is peopled by purely subjective constructions without objective validity" (vol. i. p. 63). There is no such thing as mind or soul. Mind and soul are abstractions by which the "logic of signs" groups certain nervous phenomena or refers them to a fictitious cause. There is no such thing as matter or force. Existence is a mere panorama of mental states, and my body is a group in that panorama. These two opposite theories, of which the one is the negation of the other, are by Mr. Lewes taken together. In older Positivist days he would surely have employed their mutual destructiveness as a weapon against philosophy. He would have shown how two contrary hypotheses, neither of which can be disproved, issue in nihilism, and reduce speculation to an absurdity. Now he embraces them both, and combines them into one doctrine, which he calls "reasoned realism." They are two aspects of the same phenomena, according as you approach these phenomena from the objective or the subjective side. This explanation as a metaphysical doctrine may be tenable or plausible. We do not propose to examine this form of Monism, which is indeed not new, but is now brought out by Mr. Lewes with the emphasis and fulness of knowledge which he can communicate to any discussion. We only observe that, if anything be "metaphysics," this doctrine is wholly so. Mr. Lewes's "reasoned realism" is no attempt to fulfil the promise of the first volume, that metaphysical problems were to be solved by the method of science, never invoking aid from any higher source than experience.

Because we have dwelt upon what appears to us an inconsistency in Mr. Lewes's system, we must not lead our readers to suppose that the present volume of "Problems" is mainly occupied with this purely philosophical theory. In fact, this Monism—the identity of the phenomena which in one "aspect" are called physical, in another mental—occupies a very subordinate place in a volume which is devoted almost wholly, as its title bears, to biological discussion. The display of the mechanism of the nervous system occupies nearly a third of the whole book. Here Mr. Lewes combines his own practical knowledge of physiology with abundant reference to the latest records of experiment in a branch of the subject in which he admits that analysis is still in a very imperfect state. He makes it his special business to separate what is mere inference from what is verified observation. Introductory to the exhibition of the nervous mechanism is a chapter on "the nature of life." Under this head some of the abstract or general questions are treated. The theory of vitalism, that life is an agent super-added to the organism, is rejected as pure hypothesis. Life is the expression of the whole organism. It is argued against Mr. Herbert Spencer that structure precedes function. The short section on evolution and natural selection may be noticed as an excellent specimen of Mr. Lewes's manner of giving relief and freshness to a didactic exposition by interweaving a polemic against the diverging theories of accredited, or at least contemporary, writers. The paragraph which introduces the familiar topic of evolution may be cited as an example of the art by which a reader's interest is bespoken for a discussion involving much detail necessarily wearisome:—

Every one . . . must have been impressed by this marvel of marvels; an exceedingly minute portion of living matter so simple in aspect that a line will define it, passes by successive modifications into an organism so complex that a treatise is needed to describe it. Not only do the cells in which the ovum and the spermatozoon originate pass into a complex organism reproducing the forms and features of the parents, and with these the constitutional peculiarities of the parents (their longevity, their diseases, their mental dispositions, nay, their very tricks and habits), but they may reproduce the form and features, the dispositions and diseases, of a grandfather or great-grandfather, which had lain dormant in the father or mother. Consider for an instant what this implies. A microscopic cell of albuminous compounds, wholly without trace of organs, not appreciably distinguishable from millions of other cells, contains within it the possibilities of an organism so complex and as special as that of a Newton or a Napoleon. If ever there was a case where the famous Aristotelian notion of a "potential existence" seemed justified, assuredly it is this. And although we can only by fallacy maintain the oak to be contained in the acorn, or the animal contained in the ovum, the fallacy is so natural, and indeed so difficult of escape, that there is no ground for surprise when physiologists, on first learning something of development, were found maintaining that the perfect organism existed already in the ovum, having all its lineaments in miniature, and only growing into visible dimensions through the successive stages of evolution. The preformation of the organism seemed an inevitable deduction from the opinions once universal. It was asserted that the original germ of every species contained within it all the countless individuals which in process of time might issue from it. This, the celebrated "emboliment" theory, gained scientific acceptance because physiologists could not bring themselves to believe that so marvellous a structure as that of the human organism arose by a series of successive modifications, or because they could not comprehend how it was built up, part by part, into forms so closely resembling the parent-forms.

By thus placing his reader in the middle of the history of physiology, and enlisting his sympathies with the struggle of truth to disengage itself from theory, an initial interest is awakened which brings us with fresh zest to the well-worn theme of evolution. To this—the distinctive philosophical conception of our age—Mr. Lewes makes a very important original contribution. The Darwinian hypothesis of natural selection has revolutionized zoology; but it had never been applied to physiology. Mr. Lewes maintains that we must extend our notion of the struggle for existence, and must include under it the antagonism and competition of tissues and organs. There is not only an external struggle between species and between individuals of the same species, there is also an internal struggle between portions of an organism. Just as an organism which has been modified, and thereby gained a superiority over others, has by this modification been selected for survival, so one tissue or one organ which has surpassed another in the struggle of growth will thereby have become selected. The terms of Mr. Darwin's discovery must be enlarged to make it include all the biological conditions. The idea of natural selection must be subordinated to the laws of organic affinity. All the complex organisms are evolved from organisms less complex, as these were evolved from simpler forms; the link which unites all organisms is not always the common bond of heritage, but the uniformity of organized substances acting under similar conditions.

The fourth and last "Problem" in this volume, entitled "The Reflex Theory," includes a refutation, quite convincing as it seems to us, of the "purely mechanical" doctrine. The mechanical doctrine has, in fact, established itself under cover of the ambiguous use of the term "consciousness." This term, which has imported much confusion into psychology, has been really used in two very different senses—a special and a general. In its special use "consciousness" denotes a particular reflected attention to an internal state, whereby we not only have a feeling, but dwell upon the fact that we have it. In its general sense "conscious" is an epithet applied to all psychical states, whether of sensation or of thought, and quite irrespectively of the fact of our attending to the state or not. All reflex action then is conscious in the latter sense, that in which "consciousness" stands for the total of all combined sensibilities. When the sensory mechanism reacts, that is sensation. The fact of intellectual processes taking place at times with no more consciousness than reflex actions is itself sufficient to show that a process does not lapse from the mental to the mechanical sphere simply by passing unattended to. As "vitality" is a convenient artifice of classificatory language, bringing under a common term each and every physiological function of the organism, so "consciousness" is used to denote the total of the organism's psychological functions. Each organ and its function involves the whole organism. Consciousness = sensation, and is a complex product not to be recognized in any one of its factors. The organism is not an assemblage of organs, put together like a machine. The organs are differentiations of the organism, all sharing in a common activity or inter-dependent. Thus every reaction on an impression is not only a reaction of the impressed part, but the reaction of the whole organism.

This slight summary may serve to indicate the general character of Mr. Lewes's third volume. But the book itself is one which will inevitably find its way into the hands of every student of mental science who wishes to obtain the freshest view of physiology in its relation to mind. The most interesting volume will doubtless be the fourth, which is to come, in which it may be anticipated that Mr. Lewes will engage the subject of psychology pure. The increased respect which has accrued to philosophy in the last few years, its redemption from the discredit into which it had been brought by the baseless and fantastic speculations of German lecture-rooms, is a fact which can hardly be disputed. To this revival of the credit of speculative philosophy Mr. Lewes's "Problems" have probably contributed in a larger measure than any other single English work.

POOLE'S CUSTOMS AND LEGENDS OF SOMERSET.

THIS is but a small book, but it is one of a kind which all who care for local history should help to put down. Nothing is better worth studying than local customs, superstitions, and legends, when they are studied in a critical spirit. From one point of view they have their place in the general history of districts, provinces, kingdoms; from another point of view they have their place in the general history of mankind. Nor is there any better field for such study than the particular shire which Mr. Poole has taken in hand, one which has in many ways a special history of its own, and where a great number of old customs and superstitions still linger. But Mr. C. H. Poole is not an inquirer of any critical school. He belongs to the school to which we might expect to find him belonging when he carries the ominous letters "F.R. Hist. Soc." after his name, and when he gravely quotes Mr. Phœbe. To many of our readers this last name will most likely be unknown; to those who have heard it, it will give a very good means of weighing Mr. C. H. Poole, who, we may notice, besides Mr. Phœbe, largely quotes Matthew of Westminster. "B.L.," we fancy, is some new degree

in the University of London, a degree which however seems consistent with printing three lines of Latin prose as if they were verse, and describing the author as "Q. Curtii." Lastly, Mr. Poole, who has so many and so strange letters after his own name, pays a well-known and deservedly respected magistrate of the county of which he writes the very doubtful compliment of sticking "J.P., D.L." after his name. Mr. C. H. Poole has got to learn that some things may be taken for granted.

Mr. C. H. Poole is one of those people who, when they get hold of any class of subjects, leave out nearly all the best parts of it, and spoil those which they do not leave out. Here is a book of the legends of Somerset in which the finding of the Holy Cross of Montacute—rather the Holy Cross of Lutgersbury—is wholly passed by. The very name of that historic spot is nowhere found in the book, save once incidentally in telling the story of Wulfrie of Haselbury. For we can hardly call it finding the name of Montacute, when in the Index we find "Montacute, Lord, 129. Montague, Dr. 72." It almost passes belief that these two descriptions mean the same man, a well-known Bishop of Bath and Wells. The description of the Bishop as "Lord Montacute" comes from a story "given by Warburton, who quotes it from Isaac Casaubon." There is no reference to either Warburton or Casaubon. That even Casaubon—much more than Warburton—should, if either of them really did, speak of Bishop Montague as "Lord Montacute," is quite worth noticing. We believe that other instances of the same formula may be found; we have heard of "Lord Crammer." It is the usual Continental way of describing a Bishop, and it is exactly analogous to the contemporary way of speaking of Chancellors and Chief Justices, as "Lord Bacon"—whom no one would know as "Viscount St. Albans"—"Lord Coke," and a crowd of others. But it is not at all clear whether Mr. Poole knew that "Lord Montacute" and "Dr. Montague" meant the same man. It is clear that his index-maker did not.

One of the oddest customs to be found in the county of Somerset or anywhere else was one which has come to an end within a few years, by which a yearly feast was held at North Curry in honour of King John. One is tempted to ask whether there is anywhere a feast kept in honour of William Rufus. If Mr. Poole could have given us any explanation of this strange rite, we might have been really thankful to him; all that we know ourselves is that King John gave or sold—we forget which—the manor of North Curry to the church of Wells. But all that Mr. Poole can do is to tell us, in penny-a-liner's style, about a "peculiar custom until recently observed in memory of King John, the murderer of Prince Arthur." For what kind of people can this definition of the one John in our regal history be needed, and moreover who made Arthur a "prince"? But Mr. Poole does not know everything at North Curry. There is a charming story there about King John and an owl, which, with other names, is also found elsewhere. We will not tell it to Mr. Poole; but we will gladly give it privately to any one who may be thinking of treating the legends of Somerset from the point of view of comparative mythology.

We of course have a long story of Dunstan and Glastonbury; but the stag-hunt of King Eadmund and his wonderful preservation, which, in the story at least, leads to the foundation of Muchelney Abbey, is placed vaguely on the "precipitous side of an abrupt hill." The story is comically placed on the specially "precipitous" side of one specially "abrupt hill," no other than the famous Cheddar Cliffs. We cannot at this moment turn to Mr. Poole's favourite "Matthew of Westminster," whence he seems to get most of his notions about Dunstan; but it is certain that Mr. Poole finds nothing to say about Cheddar anywhere.

Mr. Poole's fitness for dealing with any matter may be judged of within a very few pages of his beginning, where he tells that "wassailing" "proclaims to us the historical fact that when Hengist [sic] and Horsa first visited this land, at the instigation of Vortigern, Prince of the Silures, the chief became enamoured of Rowena, the niece of Hengist"—and so on, with a scrap of Robert of Gloucester (not Matthew of Westminster this time) and a "paraphrase" of the passage which "occurs in the *Antiquarian Repertory*." The "Saxons" are there spoken of quite from the outside, but it appears from a later page that Mr. C. H. Poole himself has "Gothic ancestors, who fought the Southern Swedes in a mock battle, the one personifying the summer, the other the winter." Lighting candles in the room where a corpse lies is "a relic of Catholic times, not peculiar to Somerset, but which may be found existing in Northumberland and the Isle of Man." "The Church of England," Mr. Poole adds, "did its best to destroy it." In our many and varied efforts to fix the date of "the Reformation" it might have been some help if we had had Mr. Poole by us to define "Catholic times" and "the Church of England." Mr. Poole also abounds in curious remarks which seem sometimes to need a commentator. "Ghosts," we are told, "are of Christian origin, as the idea of one could not be reproduced by Paganism." "In the *History of the Skeleton of Death*"—a work, one would think, of thrilling interest—"we find that even in the middle ages great delicacy was used in speaking of death, especially in treating of kings and nobles." It is painful to hear that "a trace of a Pagan superstition is still found existing among pious Dissenters; for, on the death of a member of their community, the sweet strains of music are often said to hover over the house." We believe that the same notion has been entertained in families of the strictest orthodoxy. So again, "Touching for the King's Evil was, and is, held as a cure; for even when the Duke of Monmouth passed through Somerset, many were presented to him, and derived benefit from

* *The Customs, Superstitions, and Legends of the County of Somerset.* Collected from various Sources. By Charles Henry Poole, B.L., F.R.S.L. F.R. Hist. Soc. F.G.S. London: Sampson Low & Co. 1877.

his healing touch." It is hard here to follow either the chronology or the line of argument. Whose touch is supposed to be effectual now? What was there wonderful in those who looked on Monmouth as King going to him to be touched? But what can the fact of a seventeenth-century King or Pretender touching prove as to the state of things now? Then what a wonderful euphemism it is to find Monmouth's insurrection so quietly described as "when the Duke of Monmouth passed through Somerset." One turns over Mr. Poole's pages to find all the old stories told, and badly told, over again without a spark of life or a breath of criticism. Alfred and Ine suffer equally. We read about "S. Cungar, son of the Emperor of Constantinople," our Emperor of Constantinople being seemingly the same as another to Mr. Poole—as one King of Denmark is the same as another to a Gloucestershire antiquary bent on displacing the real pedigree of the Berkeleys for a sham one; and Mr. Poole does not shrink from telling again that nearly the silliest of all stories about the village of Dundry taking its name from the architect having built the tower there after building two others, and saying, "Now I have done three." So again at Monksilver, another legend about the building of one of the aisles of the church is told, if we do not greatly mistake, in the very words of Mr. J. M. Neale in his *Hierologia*, without acknowledgment, inverted commas, or anything.

A book of this kind always deserves to be unsparingly exposed, because it stands in the way of something better. With Mr. Poole it would be vain to argue. When a man cannot be satisfied that "Cannards Grave" means "Cannards' grave," but must go about to find that it means "the kinchen's grove"—when he conceives that a person bearing so very modern a name as "Nancy Caniel" "lived in some period of history either never ascertained or so remote that time has effaced all traces from mortal memory"—we fear that he is beyond reformation. But the subject which he has spoiled is a good one, and even in the crude chaos of his pages hints may be found which some better qualified hand might turn to better account. Mr. Poole has notices of Mining Laws and common lands which might be useful to Sir Henry Maine. And we wonder whether it ever came into the head of Mr. C. H. Poole, as he was shovelling out his mass of rude materials, that the great master of Primitive Culture lies within the bounds of his own shire. Witchcraft is still well known in Somerset, and very curious stories can be told about it by those who go further below the surface than Mr. Poole. A small heart or an onion is still sometimes stuck with pins for the same end for which Duchess Eleanor of Gloucester was said to have made a waxen image of King Henry the Sixth. The rod still finds water, and that in most respectable hands. There is still an astrologer—perhaps more than one—who has been seen by his neighbours through the keyhole performing very strange rites in very strange company. These things are found out by scientific inquirers, and in the hands of scientific inquirers they can be made to play their part in the general history of man. As for legends of Alfred and Ine, of Glastonbury and Wells and Bath, we must warn Mr. Poole that they lie quite beyond the range of anybody who thinks it fine to put "F.R. Hist. Soc." after his name.

ARIADNÉ.*

THE study of ancient art might be expected to beget a certain temperance and calm in the modern mind. Reticence, and limit, and reserve are, it has been said a thousand times, exactly the qualities that make Greek sculpture and poetry so admirable and so unique. Why is it, then, that the students of Greek poetry and art are often so unrestrained, so Asiatic, in the expression of their admiration? As Mr. Matthew Arnold makes Homer say to some of his English and Scotch critics, "It is very well, my good friends; you do me a great deal of honour; but somehow or other you praise me too like barbarians." "One cannot help feeling that there is no very deep community of nature between them and the object of their enthusiasm." This is what one feels in reading Ouida's new novel, *Ariadné*. It is inspired no doubt by a genuine love of ancient art and of its homes in Italy and Greece. And yet there does not seem to be a very deep communion of nature between Ouida and the Greeks. We quote, for example, a passage which seems to us to be written with real though rather breathless eloquence:—

It is so beautiful, that highway to our Rome across the land from Etrurian Arezzo; the Umbrian soil is rich and fresh, masses of oak clothe the hills, avenues of oak and beech and clumps of forest-trees shelter the cattle and break the lines of olive and of vine; behind are the mountains, dusky against the light, with floating vapours veiling them, and half hiding some ruined fortress or walled village, or some pile, half palace and half prison, set high upon their ridges; and ever and again, upon some spur of them or eminence, there is some old grey city, mighty in the past and still in fame immortal; Cortona, with its citadel like a towering rock, enthroned aloft; Assisi, sacred and grey upon the high hill-top; Spoleto, lovely in her sweetness as any dream, with calm deep woods around, and at her back the purple cloud-swept heights that bear its name; Perugia Augusta, with domes and towers, cupolas and castles, endless as a forest of stone; Foligno, grand and gaunt, and still and desolate, as all these cities are, their strength spent, their fortresses useless, their errand done, their genius of war and art quenched with their beacon-fires; one by one they succeed one another in the long panorama of the Apennine range; wood and water, and corn and orchard, all beneath them and around them, fruitful and in peace, and in their midst, Jone Trasimene, soundless and

windless, with the silvery birds at rest upon its silvery waters, and here and there maybe a solitary sail, catching the light and shining like a silver shield amidst the reedy shallows.

There are many other pages which appear to show that Ouida's care for nature and art is real enough. But then, in how many other places does she show how little she has really been affected by the genius of Greek art, how little she has learned its lesson! This book is the story of four persons, or of five at the most. There is a half-learned and exceedingly archaeological old cobbler, who possesses, among other treasures, a *Hermes*—the work, he thinks, of Phidias. There is Maryx, a French sculptor of colossal genius, and Hilarion, a poet of transcendent ability as far as form goes, but heartless and a scoundrel. And there is the heroine, Ariadné, a girl of sixteen when we meet her first, the daughter of a poor painter and of a Jewess. She has lived always in a lonely place by the sea, reading Homer and Pausanias, "the old Periegetes," as Ouida affectionately calls him. On her father's death she comes to Rome to look for her Jewish kindred. Struck by her resemblance to a bronze which he believes to be an Ariadne, the old cobbler protects the girl, and introduces her to Maryx, from whom she learns his art, occupying her odd moments with a work which some one (Ouida perhaps) really should undertake—a new translation of Pausanias. All goes well, in spite of the gloomy forebodings of the mother of Maryx, an orthodox old Southern peasant woman, till Hilarion the poet wins the heart of Ariadné with a glance, carries her off, deserts her, shoots Maryx in a duel, and, lastly, wakens to moral life and to true love just when Ariadné dies of a broken heart.

Now the story of which we have given the briefest sketch may be criticized either as a romance—a novel it is not—or as an archaeological excursus. We will take the archaeology first, and endeavour to show reason why Ouida should restrain the exuberant expression of her learning till she has acquired a more accurate knowledge of her subject. By that time, no doubt, she will write in a more chastened style. As things are at present, we have "long, lush grass" in the second page, and "bestial, bloated, porphyry emperors" in the third, while Maryx is described as "a vigorous and lofty figure, with a noble head, like the Ophidian Zeus, and gleaming eyes, changeful as the skies, and the laughing mouth of Hercules." As a reader of George Sand and of Alfred de Musset, Ouida will remember that the latter poet used to cut out the superfluous adjectives of the former. Constant intercourse with works like the Ophidian Jupiter (concerning whom we have to plead total ignorance, and a suspicion that he is related to the Venus of Milo of Crotona) may do for Ouida what the author of *Rolla* did for the author of *Indiana*. It may tone down her exuberant adjectives. And now for Ouida's display of learning. As the story is supposed to be told by an old shoemaker, and as, to be dramatically correct, it must contain a few such blunders as æsthetic cobblers are likely to make, it would be unfair to charge the errors to Ouida. But surely she has made her cobbler too pedantic and too much of a classical Malaprop. Granting that Ariadné may be written with the accent as Ouida has it, why should we have *Apâte* and *Philotes* (i. 275), *Apôté* and *Philotes* (ii. 123), *Philotès* (ii. 176), *Apôté* and *Philotès* (ii. 166), *Apâte* and *Philotes* (iii. 249)? There seems a want of method in this lush wealth of opulent accents. What, again, is a "Glyptothekæ" (i. 232)? and is Apollo to be *Cytharædus*, or *Citharædus* (iii. 210), or neither or both? What ancient Roman family answered to the name of the Scipii, and why should Nisus be called Nisias? "Learning," says Hilarion, "is the only pleasure that one cannot exhaust." Ouida has still a good deal to learn, and even in the excellent classical dictionary of Dr. Smith—which, though less amusing than that of Lemprière, is more correct—she will find a sea of knowledge "like that which the child showed to St. Augustine." Perhaps, after a more serious study of the old Periegetes and similar authors, Ouida will not give all her characters that fatal "trick of natural eloquence" which, she says, was characteristic of Maryx, but which really belongs to all her people. The garrulous old cobbler turns on the stream of his classical conversation in every page. Hilarion prosés in a very tedious way about Dante, Shakespeare, and Marat, immediately after seeing one of his myriad mistresses die of cholera. In fact, Hilarion, though a great poet and a very wicked man, seems from his style of talking to have occupied much of his time in reading the *Daily Telegraph*, and the works of Messrs. Hain Friswell and Matthew Browne:—

With that divinity in him, to sit content under the mulberry trees, and see the Squires Lucy ride by in state,—one would say it would have poisoned the very soul of St. John himself. Yet never a drop of spleen or envy came in him, he had only a witty smile at false dignities, and a matchless universality of compassion that pitied the tyrant as well as the serf, and the loneliness of royalty as well as the loneliness of poverty. That is where Shakespeare is unapproachable. He is as absolutely impartial as a Greek Chorus.

The mother of Maryx even maunders in a high-flown way about the impropriety of the art of sculpture; and a boy, Amphion, whom Hilarion picked up in a Greek island, shows a romantic vein of innocent effusiveness which really and truly does not characterize the people who dwell about the borders of the Grecian sea. Here is a brief specimen of that "natural power of utterance which gave Maryx a greater sway over the minds of students than any one had possessed since Canova":—

This world of our own immediate day is weak and weary, because it is no longer young; yet it possesses one noble attribute—it has an acute and almost universal sympathy, which does indeed often degenerate into a false and illogical sentiment, yet serves to redeem an age of egotism. We have

* *Ariadné: the Story of a Dream.* By Ouida, Author of "Puck," &c. 3 vols. London: Chapman & Hall; Chatto & Windus. 1877.

escaped both the gem-like hardness of the Pagan, and the narrowing self-hood of the Christian and the Israelite. We are sick for the woe of creation, and we wonder why such woe is ours, and why it is entailed on the innocent dumb beasts, that perish in millions for us, unpitied, day and night. Rome had no altar to Pity; it is the one god that we own.

Fancy Maryx, who seems to have been reading Mr. Pater, going on for hours, and then turn to the passage in which Ouida deplores the fall of Ceres Mammosa, and the introduction of Oriental vulgarity with the Gospel:—

The passion of Solomon for baskets of gold and apples of silver coloured the visions of the recluse of Patmos. The barbaric and coarse instincts of a predatory race lent their hues to the fancy of the Apocalypse. . . . The New Jerusalem is the heaven of a jeweller, or a money-lender; it has no greatness, no spirituality, no purity; it is tawdry and hard, like a blaze of ill-set paste gaw-gaws.

To take Ouida on her own ground, and answer this archaeological lady according to her archaeology, the Elysium of Pindar, with its golden fruits and flowers, is also the "heaven of a jeweller." But surely the humour which Ouida shows when she finds St. John "tawdry" is of the broadest.

It would be unfair to criticize the characters in *Ariadne* as if the book were meant to be a novel of modern life. It is quite needless to say that there never was a cobbler like the narrator, with his treasures of ancient sculpture, and his friends among poets, profligates, painters, and cardinals. Ariadne, who at the age of sixteen knows all Pliny, and Strabo, and Stephanus Byzantinus, for what we know, who learns to outdo Maryx as a sculptor, and who goes off with Hilarion with inconceivable promptitude, cannot be imagined, by the author even, to resemble any human being. Maryx himself is the artist with whom Ouida has made us familiar in other works, but whom we do not actually find exhibiting his performances, even in the Grosvenor Gallery. In fact, the persons of the story are shadows projected on the mist, and their loves have no more reality than, to imitate Ouida, the amours of Ixion. It is not that a man may not be as heartless as Hilarion; indeed all poets have his happy knack of using personal experience as material for copy; it is not that Byron was more noble than Ouida's hero, but Byron did not prose. No living creatures ever did talk so prodigiously tall as Ouida's new characters, not even the friends of Lelia and that accomplished creature herself. We must take Ariadne and Hilarion as we take Stenio and Trenmor, at whom even the author of their existence was wont to laugh. They represent certain general aspects of human life in the modern world, as seen by Ouida and by her designed, and therefore no just critic will expect them to be like actual people. It is always dangerous to interpret allegories and hunt out suppressed meanings. A writer in *Macmillan's Magazine*, for example, has made the amazing discovery that in the meeting of Daniel Deronda and Mordecai George Eliot possibly typifies "the union of Israel and his Redeemer." Of such fulsome absurdity, the high water-mark of the appreciative gush of the age, we willingly acquit the author of *Folle Farine*. But she does appear to have her hidden intentions in *Ariadne*, though it may not be safe to try to interpret them. Maryx stands perhaps for conscientious art, an object to itself; his old mother is Faith, as conceived by Ouida, feebly protesting against all the pagan luxuriance of the period, and justified, in a dreary way, by events. Hilarion seems in this mystery to be heartless Culture, awakened too late, by remorse and pain, to the consciousness of love. We don't quite know what Ariadne herself stands for, unless she be woman's love—"La forza d'Amore non riguarda al delitto."

All allegories are dreary, or all save one or two, and, allegory or not, *Ariadne* is a hard book to read through. Greater writers than Ouida—nay, the greatest writers of all—have not conquered the difficulty of making a tale interesting in which there is no human interest. In this book the characters are as vague as abstractions can be; the plot is entirely apart and remote from possibility. We would not blame it merely on that account; it is the unnecessary tedious harangues that will weary even Ouida's public. The author never knows when she has said enough. Take, for example, this description of peasant life on the Tuscan coast:—"Life costs but little on these sunny, silent shores; four walls of loose stones, a roof of furze and brambles, a fare of fish, and fruit and 'millet bread, a fire of drift wood easily gathered—and all is told. For a feast pluck the violet cactus; for a holiday, push the old red boat to sea, and set the brown sail square against the sun. Nothing can be cheaper, perhaps few things can be better." Nothing can be better, we feel tempted to say; the passage is really excellent, a picture designed by legitimate means. But Ouida will not leave it alone, and in a long paragraph expands and overdoes the sentiment, piling up epithets that dazzle and confuse. But every word in the sentence we have quoted tells. It is the same with the description of the fountains of waters in Rome—an admirable description. The short account, too, of the advantage which French students derive from their stay in the Eternal City is perfectly truthful and sensible. But Ouida's "natural gift of utterance" is unhappily out of proportion to her reflection and intelligence. *Ariadne* is rather a literary curiosity than a romance. One reads it in wonder at the caprice with which nature throws about her gifts, good things and evil. Perhaps the small but lively school of Neo-pagans may turn from the error of their literary ways when they find that Ouida can burn, with a hard gem-like flame, with the best of them.

BISSET'S STRUGGLE FOR PARLIAMENTARY GOVERNMENT IN ENGLAND.*

NEARLY two generations ago, a writer as deeply impressed as Mr. Bisset himself with the significance of his task undertook to show that "there is no part of the history of this island which has been so inadequately treated as the character and acts of those leaders who had for the most part the direction of the public affairs of England from 1640 to 1660." William Godwin, the author of the *History of the Commonwealth*, addressed a public far more agitated by political passion and prejudice than that of the present day, and at the same time more imperfectly instructed as to the nature of the authorities which had long determined the current view of a chapter of deathless interest in our national history. He accordingly thought it well to protest in his preface, with a solemnity of which it is needless to cite the full expression, that he had "endeavoured to write with sobriety and a collected mind; to guard himself against mere declamation, and that form of language in which passion prevails to the obscuring of judgment." These are intentions with which we should not hesitate in crediting any historical writer who obviously enters upon a serious task in a serious spirit, and who is possessed of indisputable qualifications for its due performance. Mr. Bisset is no novice in historical research and composition; no mere reproducer of other men's notions, or digester of other men's compilations; his knowledge of the historical literature falling within the range of his subject, or capable of illustrating it by comparison and analogy, is both extensive and accurate; and he writes, if he will allow us to borrow an expression from a poet of whom he very unnecessarily falls foul, "all like a man." His book is not composed in that spirit of mere literary dilettantism applied to political realities which induced Horace Walpole to "hang up in his villa an engraving of the death-warrant of Charles, with the inscription 'Major Charta';" it is pervaded by an enthusiasm for political freedom without which all attempts to discuss the great constitutional crises of our national life seem like insipid dallies with the lessons they teach; and the struggle which he narrates is to him something different from a stage play. It is the more to be regretted that he fails to add to these important requisites in a writer of national history the highest of all, and one which no history, whether national or other, can spare. His book is only another proof that knowledge does not always cast out prejudice; that no case is too good to admit of being marred by intemperate advocacy; and that the difficulty of assuming more points of view than one in treating of a complicated historical growth is to some minds insuperable.

This *History of the Parliamentary struggle* offers only too many passages illustrating the tone and temper of its author; but, before advertent to some of these, we must say a word as to the general scheme of the book, which its title cannot be said very lucidly to indicate. The felicity of this title would perhaps hardly have been increased by its being put in a negative form; and Mr. Green's term, "the New Monarchy," though already current with more writers than can be charitably supposed fully to enter into its meaning, would have insufficiently served as a description of the system of Government against which was waged the struggle discussed in the volumes before us. The view, however, taken of the general course of our history during the period of the "New Monarchy" in so popular a book as Mr. Green's, in itself suffices to prove that there is no essential novelty in the general line of Mr. Bisset's argument. It is therefore with a certain degree of surprise, not unminged with doubts aroused by the not very clear form of the statement, that we find in Mr. Bisset's preface a kind of promise to give, so to speak, a special turn to the historical fact that the great struggle of the seventeenth century was in truth a struggle against a tyranny which had asserted, and was seeking definitively to establish, itself over the laws and liberties of Englishmen:—

What is, as far as I know, a new view of English history presented in the following pages is the conclusion, legitimately drawn from the proceedings of the last Plantagenets, at least of Edward IV., and of the Tudors and Stuarts, that their deliberate purpose being to destroy utterly the English Constitution as it had existed from the establishment of the House of Commons by Simon de Montfort, and such purpose having become an overt act by the habitual use of torture and the abolition of the ancient rule of evidence, that the accuser and accused should be brought face to face, it was the right and duty of Englishmen, as soon as they had the power, to make an example of the first of these tyrants, whether bearing the name of Plantagenet, Tudor, or Stuart, who should fall into their hands—such example being the only way of saving from destruction the system of representation, without which both reason and experience have proved that good government is impossible. The conclusion is inevitable, that the execution of Charles I. was a political necessity.

On second thoughts, Mr. Bisset is fain to substitute for the phrase "good government" that of "government not intolerably bad"; "for absolutely good government, as far as we know at present, is impossible"—a secure position which he goes on to illustrate by a tolerably familiar quotation from Macaulay, showing with copious rhetoric that Parliamentary institutions are undeniably excellent, undeniably imperfect, and undeniably safer than irresponsible government.

We have often had cause to admire—in more senses than one—the inveterate habit of historical politicians (for in truth they deserve that name rather than that of political historians) to lay down *ex post facto* principles of action for men who, though they

* *The History of the Struggle for Parliamentary Government in England*, By Andrew Bisset. 2 vols. London: Henry S. King & Co. 1877.

may have known very well what they were about, were necessarily at a disadvantage in comparison with prophets enabled to prophesy backwards. Mr. Bisset's method of dealing with English history, we confess, has to us something of the savour of such attempts. Looking upon the course of public affairs during the Tudor reigns, one is at a loss to discover any traces of a consistent conspiracy on the part of the wearers of the Crown against the Parliamentary system, and still less able to picture to oneself imaginary guardians of the national liberties lying in wait to bring a tyrannical head to the block. The English Parliamentary Constitution did not descend from heaven like Socrates's ruling principle of the conduct of life, but was itself the growth of circumstances; and other circumstances, the force of which was at the most only seconded by the designs of royal statecraft, placed it temporarily, though never entirely, in abeyance. Barons and Church had been reduced to relative impotence, and the despotism of the Tudors would have found a ready instrument in the House of Commons even without the modifications of its constituencies and the manipulation of its proceedings which, as adroit administrators, some of them permitted themselves. The foundations of some of those abuses which rose to a height in the fatal years preceding the meeting of the Long Parliament were laid by Henry VII. with little, if any, consciousness of their ulterior constitutional import, and rather with a single-minded intention of securing the tenure of the throne—an object of primary moment to the tranquillity and prosperity of the nation at large. Nor was it till the latter part of Elizabeth's reign that the straining of the royal prerogative became a political problem of manifest hazard, and that the struggle began to announce itself which the accession of James and the ostentatious impotence of his foreign policy, and the naked pretensions combined with the glaring vices of his domestic rule, speedily advanced into a stage of declared conflict. We see no reason to attach to the special abuses insisted upon by Mr. Bisset the special significance which he assigns to them, so far as the general progress of this conflict is concerned. The issues upon which the Parliaments of James and the early Parliaments of Charles confronted the assumptions of the Crown were stated by them with sufficient clearness, and with sufficient repetition, to show that what lay at the root of the struggle was the utter absence of harmony between Crown and people on those questions the agitation of which has justly given to the whole movement the name of the Puritan Revolution; while the means by which the struggle was carried on in its earlier phases were found in Parliamentary rights which even the Tudors had in the main deemed it prudent to respect. The struggle for Parliamentary government begins, in its premonitory symptoms, with the mistakes, partially disavowed, of Elizabeth's later years; it is prematurely developed by the glaring contrast between blatant theory and impotent practice under James; it declares itself with the Petition of Right, and the open attempt of Charles to render nugatory his assent to that statute.

Looking at the struggle, as narrated by Mr. Bisset, from the other end, what do we see? Granting the consistency in the conspiring tendencies of our Kings, "whether bearing the name of Plantagenet, Tudor, or Stuart," what are we to say of the consistency of those who struggled on behalf of "Parliamentary government"? We will follow Mr. Bisset across the gulf which in the memorable autumn recess of 1641 sprang up between the two sections of the hitherto virtually unanimous Long Parliament. His account of this division, to explain which he thinks it "hardly necessary to go into a long digression," is, by the way, extremely unsatisfactory. Instead of expounding what signally requires exposition, he takes up his parable against a subject already (and in its place appropriately) discussed by him with sufficient distinctness—the character of King James and his Court. He summarily dismisses the lately vexed question as to the motive of Falkland's conduct by reminding us that Falkland had a high value for Ben Jonson, in whom Scott has pointed out characteristics such as "might be expected in the Court of James I."—

Now, while we know so much of Scott, who censures Ben Jonson, we know almost nothing of Falkland, who praises him, but what Clarendon, his friend and panegyrist, has told us; and we know enough of Clarendon's unscrupulous advocacy to refuse to accept either his praise or blame of any man, unless confirmed by independent unexceptionable testimony. The conclusion would seem to be that Hyde and Falkland, though they objected to the tyranny and insolence of Strafford, having got rid of Strafford, had now no objection to the tyranny and other vices of the Stuarts, provided one of them stepped into the place left vacant by the death of Strafford. Whether or not they knew as much of the darker vices of the Court of James I. as those peers who, as we have seen, went all the way with the Commonwealth men, they were not willing to act any longer with Pym and Hampden.

For it should be observed that Mr. Bisset had previously shown how "the men who knew most respecting the Court of the Stuarts enrolled themselves among those who pronounced 'the office of King in this nation to be unnecessary, burdensome, and dangerous';" and that among these martyrs to this experience he had mentioned that pensive patriot, the Earl of Pembroke! But, to return to our point, what were the changes of which, conscious of the vices of the Court where he had spent his earlier days, Pembroke so cheerfully accepted the results? Beyond a doubt it was for the cause of Parliamentary government that Pym and Hampden carried on the struggle in which Hyde and Falkland now took up the opposite side; but in what sense can the same be asserted of the later stages of the revolutionary conflict? When, two years after Pym's death (Mr. Bisset comments on the contrast between his public funeral and Hampden's obscure obsequies in terms which

for once seem to us somewhat ungenerous), the second great disruption took place in the popular party, what were, in Mr. Bisset's opinion, the issues upon which it turned? They shall be given in his own words:—

According to the present very inaccurate phraseology, the two parties, at the head of which respectively were Essex and Cromwell, would be called the aristocratical and democratical parties, into which the Parliament of England was then divided. But more accurately they may be termed the oligarchical and aristocratical parties. For it was the object of Essex's party that England should select those men who were to lead her councils and command her armies, not for their fitness, but for their wealth and rank; while it was the object of Cromwell's party that fitness alone should be looked to in the selection without regard to either rank or wealth. Therefore Cromwell's object was an aristocracy in the sense used by Aristotle, as opposed to oligarchy—the rule of the best. But the word had another meaning—the rule of the best-born; and this was Essex and Holles's aristocracy—an aristocracy of titles, pedigrees, and rents. What a nation would sink to under such an aristocracy as that of Holles we may judge by the state of the English army, when Holles's friends gave commissions to their footmen; when Ensign Northerton and the Captain in Hamilton's Bawn were the representatives of a class; when the last alternative of a man of quality's lackey was a commission in the army or to take to the highway. The reader may then judge of the spirit which animated these oligarchical Presbyterians, when they sought to hunt down a man as a public enemy because he ought to form an army such that for efficiency it has never been equalled upon earth, instead of an army composed by lackeys, officered by stupid debauchees, and commanded by men whose chief recommendation for command was their being peers possessed of large fortunes.

"The best," whose claim to the title thus temperately explained we are by no means inclined to dispute, prevailed by means of the Self-Denying Ordinance, of which we may remark that Mr. Bisset rectifies the ordinarily current account. We cannot further pursue his narrative of the "struggle for Parliamentary government," except so far as to dwell for a moment on its conclusion, in which he once more recurs to the position assumed by him in his preface. On the subject of the "course of bringing the King to judgment," adopted by Cromwell and Ireton, Mr. Bisset, after "going along with them" from the time of the modelling of the army to that of the Remonstrance of the army for justice upon the King, is obliged to doubt the soundness of their proceedings. He regards the attempt to make the King responsible as an elected monarch for high treason and other crimes committed against his people, as altogether futile—for "it is useless to talk of a kingdom being elective which not only descended by a certain line of devolution, but which Henry VIII. considered so much his private property as to dispose of it by will, and which his daughter Elizabeth on her death-bed made over to James VI. of Scotland." We need not stop to suggest certain modifications in both these illustrations. In Mr. Bisset's opinion, Bradshaw might have been saved a great deal of trouble, and the King deprived of very unnecessary opportunities of moving compassion:—

Battles make kings. Battles made William I. and Henry VII. Kings of England. I have said before that the Tudors in changing the law of England as to torture and witnesses did not pretend to a new conquest—and yet the battle of Bosworth made the Tudors kings, but it was chiefly won by English against English. So were the battles of Marston Moor and Naseby; and the Independents who won them had as much right to set up a new government as the Tudors had after the battle of Bosworth. The Independents had defeated the King and his adherents in many decisive battles. They were therefore an Independent State set up by the god of battles; and they should have tried King Charles as a prisoner of war who had earned on war in a manner that had worked a forfeiture of his life; besides being the representative and imitator of a line of tyrants who, having oppressed the people of England by cruel trials and tortures which were against the law of England, was fit to be made a public example and warning to all such tyrants in time to come.

Our readers will perhaps by this time have judged for themselves of Mr. Bisset's general method of treating the history of a struggle to which he has certainly succeeded in giving a unity of its—or rather his—own. We shall not weary them by endeavouring to contrast with this method that of other historians who have been contented to show how the great civil conflict developed itself, like other revolutions, phase out of phase, till the paradoxical was made possible, till an illegal power was established in defiance alike of King, Parliament, and nation, and till at last, before a *tabula rasa* had been made for writing down the principles of the new government, the movement was mastered by the arm which had so long seemed to direct it. This, indeed, and what followed, lie out of Mr. Bisset's scheme, the limits of which are determined by his own conception; and he is spared the task of depicting Cromwell, in Guizot's phrase, "invoking necessity."

In conclusion, while repeating our tribute to Mr. Bisset's careful study and frequently most effective and instructive use of his materials, we must enter a protest, quite irrespective of political or historical views and opinions, against a violence of expression which in a grave writer is always matter for regret, if not for a rather stronger sentiment. It is not easy to pass, with the equanimity one would desire to maintain even in reading about the Tudor and Stuart reigns, over such denunciations as this:—"Indeed the whole pack of courtiers and Court or Crown lawyers of the Tudors and Stuarts were a pack of wolves in the human form"; nor, with all due remembrance of his reckless ambition and his fatal failures, can we tolerate the taste which in one page compares Buckingham to Caligula's horse, and his and his master's undertakings to "the enterprises of such things as Stephano, Trinculo, and Caliban." In dealing with Laud Mr. Bisset completely gives way to his spleen, and, besides accumulating upon its object the minor charges of a bad temper and a bad digestion, offers the following at least novel illustration of Laud's wickedness of heart:—

Strafford's correspondent, the Rev. George Garrard, writes thus on the 3rd June, 1634: "No mercy showed to Fryane; he stood in the pillory."

and lost his first ear in a pillory in the Palace at Westminster in full term, his other in Chapside, where, while he stood, his volumes were burnt, under his nose, which had almost suffocated him."

The picture is revolting enough, and little calculated to raise a smile. Can as much be said for Mr. Bisset's comment?—"The suffocation was no part of the sentence; but Laud's malice and cruelty were boundless." Far be it from us to cavil at an indignation which, like that of Mr. Bisset, is always honest and often too well-founded; but invective has its limits even in oratory, and the form of expression which he quotes with approval from Oliver St. John's speech against Strafford is one which upon the whole is unsuited for the habitual use of historical writers.

CARPENTER'S MESMERISM AND SPIRITUALISM*

IN the lectures now republished with additional notes and illustrations Dr. Carpenter has given a very sufficient exposition of the latest epidemic delusion from the point of view of sober common sense. Not only to Spiritualists, but to the pretty large number of people who are inclined in a vague way to think that the Spiritualists have not had fair play, this may seem a question-begging term; and in one sense it is. For if a man has once grasped the facts that there are such things as epidemic delusions, that it is hardly possible to name any age or country which has been free from them, and that, under a great variety of forms, they have always presented the same leading characters, he will be provided with the most effectual safeguard, not merely against the cult of rapping ghosts, but against whatever new monster begotten by imposture upon morbid imagination may hereafter rise up to fill its place. Epidemic delusions have existed; we cannot be surprised at their present existence; and when we find among certain persons here and now a state of belief which has all the historical marks of an epidemic delusion, we are perfectly justified in presuming that the similar effects are due to no other than similar causes. It may be difficult to express with accuracy the logical value of a presumption of this kind; but its effect is in practice irresistible to those who are not deaf to the lessons of history and the analogies of human nature. Spiritualists appeal, for example, to a great mass of allegations, purporting to be positive uncontradicted evidence. The so-called evidence is rejected by the unconscious logic of common sense, which, however, does not always find it easy, without special training, to justify its repugnance. But common sense fortified by history tells us that one of the constant marks of an epidemic delusion is the rapid production of an immense quantity of apparent evidence in a form and under circumstances that make real scrutiny impossible. The vulgarst false prophet was never at a loss for signs and wonders, and the example of Mahomet shows how much harder it is to disclaim than to command these vouchers of the prophetic mission. *Populus vult decipi et decipitur*; and the meaning of the proverb is fully brought out only when we take the verb in a middle rather than a passive sense. Deliberate imposture may foster the mushroom growth of the host of witnesses always ready to spring up on these occasions; but the growth itself is beyond the compass of art. So in the physical order the subtle contagions of the zymotic diseases mock the clumsy skill of the poisoner. Whoso perceives these things may also perceive that the direct application of reasoning is not the most appropriate remedy for mischiefs of this kind. You cannot argue a patient out of hysterics. To take the standing instance, it is certain, as Mr. Lecky has excellently shown, that Englishmen were not reasoned out of the belief in witchcraft. Their deliverance did not come by a scientific process working in the understanding, like the spread of Galileo's or Newton's doctrines; it was the removal of a diseased habit of mind. In every such case, therefore, the task for that part of mankind which keeps its sound reason is not to fight the hydra-headed delusion in detail, but to strike at the roots of its life by cultivating sound thinking. Medicine is of little avail; it is in an improved regimen that help must be looked for.

Dr. Carpenter is fully aware of this, and the prophylactic regimen he prescribes is an early training in the principles of scientific method; not merely, be it observed, in familiarity with some special branch of science. We should be inclined to add the critical study—not necessarily a minute study—of human testimony in some of the many broad fields spread forth by law and history. It has lately been seen that a man of great scientific eminence may fall into almost incredible puerilities simply because he cannot or will not realize the truism attributed to Paley by a legendary undergraduate, "that it is not contrary to experience that witness may be false." But it is perhaps impossible to assign any certain antidote to mental any more than to physical infections. The experience of English judges in investigating facts did not save them from being carried away like other folk by the witch mania. This standing and pre-eminent example shows, as Dr. Carpenter justly points out, that even the majority of sensible people may catch the current delusion and be deprived of their common sense for a time. Whether we consider the amount of evidence, its bearing on the interest of the witnesses themselves, or the number and sort of people who believed it, the case for witchcraft is infinitely stronger than for Spiritualism. Let not the reader think, however, that we offer this familiar consideration as an argument to be used by

way of *reductio ad absurdum* against Spiritualists. Persons who have reached a certain point in self-deception are even more proof, if possible, against a *reductio ad absurdum* than against any other form of dialectic, as they have cast off all sense of absurdity. A thoroughgoing Spiritualist would find no difficulty in maintaining that there is a large element of truth in all the ancient and modern tales of sorcery, and that the unhappy creatures who in these kingdoms were convicted and executed by scores on their own confessions were misunderstood mediums.

If Dr. Carpenter's treatment of these subjects has a fault, it is that he gives himself too much trouble to expose the feats of magicians, clairvoyants, and mediums in detail. It seems to us that adherents of common sense are no more bound to give their own account of all these performances than they are bound to explain all the tricks of a conjuror. Some of the things constantly done by Indian jugglers with hardly any visible apparatus remain to this day unexplained, to say nothing of the modern inventions of M. Houdin or Messrs. Maskelyne and Cooke. Yet nobody (Spiritualists always excepted) thinks in these cases of calling in supernatural causes or unknown natural agencies. From the point of view of scientific physiology, which of course is Dr. Carpenter's own point of view, the study of the abnormal nervous and mental states which are the groundwork of delusions is highly interesting and instructive; and it seems pretty clear that a great deal may yet be learnt in this direction. Scientific explanation of details, so far as yet attained, is welcome to common sense, and the possession of it is an additional security; but it would be a mistake to suppose that the judgment of common sense depends upon it. The scientific view of the whole matter, on the other hand, is simply the view of common sense made more precise. A class of extraordinary phenomena, the strength of whose manifestations varies directly as the predisposition of the observer to accept them, and is liable to be indefinitely reduced by the presence of sceptical inquirers, may at once be set down as belonging to the subjective and not the objective order of events. Spiritualists say the phenomena are of a kind which can only be the product of human intelligence or something like it; and they are quite right; only common sense goes a step further and says they are nothing but the product—partly designed, partly undesigned—of the intelligence of the living human beings who take part in the proceedings. The phenomena of hypnotism, or what is sometimes absurdly called electro-biology, show the startling effects of artificially induced predisposition which may be obtained by appropriate means. But delusion from expectancy may also occur spontaneously and in the waking state. Dr. Carpenter gives the following curious example:—

A lady, whose mind had been a good deal occupied on the subject of drinking-fountains, was walking from Penryn to Falmouth, and thought she saw in the road a newly-erected fountain, with the inscription, "If any man thirst, let him come hither and drink." Some time afterwards, on mentioning the fact with pleasure to the daughters of a gentleman whom she supposed to have erected it, she was greatly surprised to learn from them that no such drink-fountain existed; and on subsequently repairing to the spot, she found nothing but a few stones, which constituted the foundation on which her expectant imagination had built an ideal superstructure.

What force, then, may not the imagination acquire by a process of unconscious self-deception when expectation is deliberately cultivated? Dr. Carpenter well says:—

Sceptical enquirers, like myself, are continually told:—"You must not form your negative conclusions from one or two failures; but you must persevere in your enquiries until you get positive results." This is just like John Wesley's advice to a young preacher, who was lamenting his want of "faith," and asking his advice as to continuing in the ministry:—"Preach faith till you have it, and then you will preach it because you have it." Spiritualistic disciples are bidden to sit hour after hour, and day after day, until they pass into the state of mind in which they can be brought to believe anything; they have been led to expect; and thenceforth they rail at scientific sceptics for not abnegating their intellectual discrimination by submitting themselves to a process which dethrones their higher powers from their normal supremacy, and leaves their imaginations free scope.

The special topic most fully dealt with in the book is that of *clairvoyance*. The successes of several celebrated performers up to a certain point, and their failures under really efficient tests, are set forth in a very clear and instructive manner. They traded partly on happy guesses and the dexterous use of information—which last can be made to go a wonderfully long way—but chiefly on the little known physical fact that to blindfold a person determined to see is in truth very far from an easy business. When experts insisted on making the blindfolding complete, the *clairvoyance* was found to come to an end. This is a type of what happens in the case of all such pretensions; the shapes of delusion and imposture are infinite even to bewilderment, the main lines are the same even to weariness.

Dr. Carpenter's book will probably convert no Spiritualist to common sense; that achievement may well pass the wit of man. It may, however, save some readers from regarding gross imposture with feelings of amiable curiosity, or giving the countenance of what is called, we believe, "candid inquiry" to an idle and mischievous folly.

CARRE'S BORDER MEMORIES.*

THIS book is a sort of family history of the Riddells and Carres, with subsidiary notices of the Elliots, Scotts, and

* *Mesmerism, Spiritualism, &c., Historically and Scientifically Considered; being Two Lectures delivered at the London Institution.* By William B. Carpenter, C.B., &c. London: Longmans, Green, & Co. 1877.

* *Border Memories; or, Sketches of Prominent Men and Women of the Border.* By the late Walter Riddell Carre, Esq. Edited by James Tait. London: Simpkin, Marshall, & Co.

other families with whom they were connected, the whole being eked out with biographical notices and would-be witty anecdotes concerning sundry local heroes whose fame for the most part has never reached beyond the counties where they are still borne in mind. The materials were collected by the late Mr. Riddell Carre of Cavers Carre, who was something of an antiquary, and for whom all the scraps of information which he could anywhere glean bearing upon his own family history or that of any of his kindred had a special interest. The particulars which he thus collected formed the delight of his neighbours as well as his own, and Mr. Riddell Carre gained a local reputation for his lectures on the worthies of real or fancied reputation who had flourished in the southern counties of his native land. Out of these lectures the volume which we have now in hand has grown. Unfortunately it has not been put together by Mr. Carre himself, as he literally caught his death of cold while going to deliver one of these highly popular lectures, and died leaving his manuscripts for other hands to prepare for the press. The task of editing them has been undertaken by a Mr. Tait, who, we take it, is, or has been, editor of the *Kelso Chronicle*. The editor disclaims any serious interference with the text, and, with the exception of some condensation by cutting off needless repetitions, professes to have given the papers to the world very much as the compiler left them. This, no doubt, showed an admirable self-control on his part, and a praiseworthy feeling of respect for the departed author. But we cannot help thinking that it would have been quite as well for Mr. Carre's literary reputation if his editor had made some attempt to break up some of the most involved sentences, so as to make them at least intelligible. As it is, the reader is more firmly convinced with each succeeding page that, though Mr. Carre had certainly a great deal to say, he did not in the least know how to say it. A paragraph referring to Mrs. Somerville, for instance, might lead any one to suppose that she had shared somewhat the nature of Cerberus, who was "three gentlemen at once":—

Dr. Somerville was of a wise well connected, and he had the honour of having for his daughter-in-law Mrs. Mary Somerville, one of the most profoundly scientific ladies of the present age. She was, besides, the niece of Mrs. Somerville, senior, who's sister married Admiral Sir William Faraday, the father of the talented authoress of the "Mechanism of the Heavens," and other works of great fame, for which she received many well-deserved acknowledgments.

This is a worse confusion even than that which existed in the mind of Laplace when he assured Mrs. Somerville herself that she and Mrs. Greg were the only two people who understood him. Still more perplexing is the account given of the second marriage of that Duchess of Buccleugh who was also Duchess of Monmouth:—

The king generously and feelingly gave the Duchess a gift of all the personal and real estates of the Duke, which had been forfeited; and after a time—say in about three years—she married Lord Cornwallis, ancestor of the great Marquis of imperishable fame, but the marriage was dissolved in about ten years, by the death of the noble Lord, to whom she had three children, one of whom—Lady Isabella Scott, succeeded to the *Michese Lordship*,—her only brother having died,—including the Bailiery and Patronage of the Church, and, under the jurisdiction act of 1747, she got £2,000 for her rights, instead however of 5,000, being her full claim. She died very soon after the arrangement was made.

Not a little amusing is it to note that, while the reader is expected at once to catch the drift of such hard sentences, it is taken for granted that he will not understand such an expression as a "Foul Raid," which is translated for his benefit into a "disgraceful expedition."

However minutely Mr. Carre was acquainted with all the ins and outs of Border raids and Border pedigrees, it is clear that his studies had not been pushed far enough to give him an elementary knowledge of any history, not even of that of his own country. He talks in all seriousness and good faith of one Solvatus, King of the Scots, as an adversary of Donald Bane, and professes himself unable to decide whether the legend about the mysterious stranger who rendered good service to this same Solvatus be a true or false account of the origin of the Douglas family. He is quite as ready to believe that the name itself originated in the words "Sholto Dhu Glas," supposed to be the Gaelic for "see that dark man," as that it became the surname of the descendants of Theobald the Fleming, from the lands of Douglas conferred on him by one of the sons of Malcolm. After such a display of credulous simplicity we are not surprised to be told in another page that the founder of the Riddell family, who "was a companion of William the Conqueror," is entered as "Monsieur Ridel" on the roll of Battle Abbey. Nor is this all. William the Conqueror himself, doubtless from having been the companion of a Ridel, finds a place in this pantheon of Border notables; and the author, going far a-field indeed from his Borderland, explains that

Battel Abbey, which is a memorial of one of the greatest achievements in English history, was built on the extensive plain of Heathfield, a little to the north of Hastings, in fulfilment of a pledge given by the great Norman, prior to the battle which gained for him the crown of England. William had been named by Edward the Confessor, the last of the Saxon line, his successor, though Edgar Atheling was the next legitimate heir, and Harold had usurped the throne.

This talk about usurping the throne brings to mind another very odd statement—to wit, that the foundation of Monmouth's sudden rise to the summit of fashion and fortune lay in the fact that "Queen Henrietta, who was fond of him, brought him to London in 1662." Whether this strange sentence sprang from a confusion between the wives of Charles I. and of Charles II., or between

either of them and Lady Henrietta Wentworth, or from a hopeless mixing up of all three, we are quite at a loss to determine.

After the Kers and Riddells, for whose special glorification *Border Memories* have been compiled, the Elliots and Scotts meet with a good share of attention. Many of the anecdotes of the Elliots are now well known since the publication of the memoirs of the Earl of Minto. Still some of them are so good that they very well bear twice telling. Not the least noteworthy of this remarkably clever family was Miss Jean Elliot, the composer of that popular Border ballad known as the "Flowers of the Forest." She figured among the literary ladies of Edinburgh, and enjoyed the further distinction of being the proud possessor of the last private sedan-chair kept in Edinburgh. The Elliots were as ready with their tongues as with either pen or sword, and never at a loss for a witty repartee. The first who took the courtesy title of Lord Minto, when made a Judge of the Court of Session, was but a younger son—a fact that his elder brother the laird was determined should not be lost sight of; and as his brother was sitting as a circuit Judge, he shouldered his way into the crowded court, silencing the ushers who attempted to clear the way for Lord Minto's brother by drily remarking, "Na, na, Gibbie's my brother." But the Elliots were well matched in wit as well as war amid their fellow-borderers. On one occasion Lord Minto took with him his friend Lord Kames to pay a visit to old Armstrong of Sorbie. His host asking who the "lang, black, dour-looking chiel" he brought with him was, Lord Minto described him as a man come to "ha' a' the Armstrongs"; which was met with the ready retort, "A' it's time the Elliots were riding." Very little behind 'he' on and Armstrongs in Border raids and fays were the Scotts. So next engage Mr. Carre's attention. He tells the old, well-worn stories about "Harden's cow" and "muckle-mowed Meg," but adds to them one of his own concerning a certain Scott who turned Quaker:—

Another of the name of John Scott of Leith became a Quaker, making himself notorious for brewing on Sunday, for which he was fined very heavily on the evidence of the Bailie and minister, with whom he was very angry, protesting that he might as well brew on the Sunday as the minister might take money for going up to a desk and talking, and throwing water in a barn's face.

In spite of this very logical defence, we are not surprised to hear that Scott appealed in vain to the Privy Council.

Scotts, Elliots, and Carres being disposed of, the remaining Border notables are massed together according to the counties which may lay claim to them. At first sight it would seem as if a vast proportion of celebrated characters had been born in Selkirk and Roxburgh. But, on looking closer, we find that the claim to celebrity is based on the slenderest possible foundation; and we read for the first time the names and life stories, often striking and pathetic, of numbers of bards or prophets whose fame has never reached beyond the boundaries of the parish which still wonders at the greatness of their gifts. Then again Mr. Carre devotes many pages to the history of the Napiers, who cannot with justice be claimed as a Border family, since their connexion with Selkirkshire came about from intermarriage with the Scots of Thirlestane. Under the heading "Miscellaneous Celebrities," we find notices of sundry "parish baddies," a race unhappily fast becoming extinct even in Scotland. But Mr. Carre finds a never-failing stock of "celebrities" in the pulpit. Ministers, whether of the Establishment or of every varying shade of Dissent, are all dignified by him with the title of "Divines." Many of the anecdotes told of these worthies are already familiar to the readers of Dean Ramsay's "Reminiscences," though, from Mr. Carre's long-winded way of telling them, one can scarcely recognize them as the same stories. Among these "Divines" one of the few whose name is really familiar to us is "Thomas Boston," whose "Crook in the Lot" and "Fourfold State" still keep their place as favourite devotional books with a certain class of readers on both sides of the Border. Boston, who was, we believe, one of the sect known as "Original Seceders," is described by Mr. Carre as a "Non-juror." How little he knew the meaning of the word is shown in the next sentence, where he manages to mix up the High-Church bishop and the Dissenting hymn-writer:—

Bishop Ken, the author of those beautiful morning and evening hymns so dear to the people of England, and Isaac Watts, the author of the divine songs which, I may say, are dear to all Christian people, were both non-jurors.

Perhaps the best known of all Mr. Carre's heroes is Mungo Park, who, like Livingstone, his great follower in the field of African exploration, had studied for the medical profession, and indeed for some years practised as a doctor. How little he liked the life of a doctor in a small country town we was at no pains to conceal; for, shortly before starting on his journey to Africa, we find him writing "that a few inglorious winters of practice at Peebles was a risk as great, and would tend as effectually to shorten life, as the journey he was about to undertake." One of the few names worth remembering among the "bards" is that of Henry Francis Lyte, the author of the popular hymn "Abide with me." Though he passed the greater part of his life as a clergyman in a Devonshire living, he was a Scottish Borderer by birth. His sacred poetry is so simple and so free from any sectarian spirit that it has found its way into the hymn-books of all denominations, from the *Book of Praise* down to Mr. Spurgeon's *Own Hymn-Book*. We cannot see on what grounds Mr. Carre introduces Lord Campbell as a "Border celebrity." As he was born at Gupar, Fife, the Border can claim no part or lot in his fame. Here we find, nevertheless, not only the story of his life and of his death, but also

the interesting information that his brain weighed "53½ ounces." Why Mr. Carré should consider it "very remarkable that it was found to be in a perfectly healthy state" we cannot well make out, unless indeed he regards as a symptom of approaching imbecility the fact of Lord Campbell's admiring the series of papers called the *Recreations of a Country Parson*, and not only inviting the author of them to assist him, but taking him for a *bond fide* English parson and offering him an English living, all which is set forth in a previous paragraph. Although Mr. Carré's book is badly put together, and shows a lamentable want of historical knowledge, it displays a vast deal of pains in raking up genealogical gossip, and will, we doubt not, be warmly welcomed by all and each of those who can claim kindred with any of the "Border Celebrities" whose names are handed down to posterity in its pages.

TWO NOVELS.*

MME. VILLARI'S work is not noticeable for depth of passion or power of delineation, but it is graceful, and shows that she takes pains and does not shirk the trouble that is included in all honest endeavour. Also, unlike many of our lady novelists, she seldom trips in her grammar, though her style is not always elegant; and she understands how to give the local colour of the countries wherein she lays her scenes, so that Italy is not endowed with the characteristics of England, and Germany does not appear with the features of Yorkshire and the manners of the Pictories.

The story of *In Change Unchanged* is slight, and we are not fatigued by over-rapidity of action or feverish energy of character. The book, indeed, would have been improved had a little more fire and movement been put into it; and it would have decidedly gained by compression. The plot is too weak to bear expansion into two volumes; and the various hesitations and misunderstandings between Edith and Bethune which are necessary to fill up the space become at last monotonous, more especially as a little honest straightforwardness might have done away with all doubts long before the reader is allowed the luxury of assisting at the happiness of the two lovers. And is not "Miss Whitman" too close a portrait for good work? The exact transcription of character is one of the commonest mistakes of the many which are made by inexperienced writers. They take a model, reproduce it with that inartistic fidelity to unimportant details which destroys both likeness and illusion, and then think that they must be successful because, as they say, they have taken so-and-so from the life. When their critics maintain that this so-and-so is not true to nature, they complain of being found fault with unjustly, and fall back on the old plea of an actual and living model. Yet this close copying of unimportant details, whereby the whole portrait becomes, as it were, out of focus and perspective, gives us something which is no more true to nature or fact than would be the picture of a bird with some of the feathers made out in exaggerated proportion and inharmonious precision. The most sketchy outline, correctly rendered, would be truer and more suggestive than this partial precision; and what is true of a painted picture is true of a written portrait. It is the old difference between two schools—the one which upholds the direct imitation of parts, mere unimaginative copying, whereby no idea of the whole is conveyed; the other aiming at that synthetic re-creation which preserves only the leading lines, and suggests all the unimportant details. In the portrait of "Miss Whitman," taken as it evidently is from a lady who in her lifetime was one of the most prominent figures in English society at Florence, Mme. Villari has decidedly erred by too close fidelity to her model.
